

**A COMPANION TO THE
ACHAEMENID PERSIAN EMPIRE**

BLACKWELL COMPANIONS TO THE ANCIENT WORLD

This series provides sophisticated and authoritative overviews of periods of ancient history, genres of classical literature, and the most important themes in ancient culture. Each volume comprises approximately twenty-five and forty concise essays written by individual scholars within their area of specialization. The essays are written in a clear, provocative, and lively manner, designed for an international audience of scholars, students, and general readers.

Ancient History

A Companion to the Roman Army

Edited by Paul Erdkamp

A Companion to the Roman Republic

Edited by Nathan Rosenstein and Robert Morstein-Marx

A Companion to the Classical Greek World

Edited by Konrad H. Kinz

A Companion to the Ancient Near East

Edited by Daniel C. Snell

A Companion to the Hellenistic World

Edited by Andrew Erskine

A Companion to Late Antiquity

Edited by Philip Rousseau

A Companion to Ancient History

Edited by Andrew Erskine

A Companion to Archaic Greece

Edited by Kurt A. Raaflaub and Hans van Wees

A Companion to Julius Caesar

Edited by Miriam Griffin

A Companion to Byzantium

Edited by Liz James

A Companion to Ancient Egypt

Edited by Alan B. Lloyd

A Companion to Ancient Macedonia

Edited by Joseph Roisman and Ian Worthington

A Companion to the Punic Wars

Edited by Dexter Hoyos

A Companion to Augustine

Edited by Mark Vessey

A Companion to Marcus Aurelius

Edited by Marcel van Ackeren

A Companion to Ancient Greek Government

Edited by Hans Beck

A Companion to the Neronian Age

Edited by Emma Buckley and Martin T. Dinter

A Companion to Greek Democracy and the Roman Republic

Edited by Dean Hammer

A Companion to Livy

Edited by Bernard Mineo

A Companion to Ancient Thrace

Edited by Julia Valeva, Emil Nankov, and Denver Graninger

A Companion to Roman Italy

Edited by Alison E. Cooley

A Companion to the Etruscans

Edited by Sinclair Bell and Alexandra A. Carpino

A Companion to the Flavian Age of Imperial Rome

Edited by Andrew Zissos

A Companion to Science, Technology, and Medicine in Ancient Greece and Rome

Edited by Georgia L. Irby

A Companion to the City of Rome

Edited by Amanda Claridge and Claire Holleran

A Companion to Greeks Across the Ancient World

Edited by Franco De Angelis

A Companion to Late Ancient Jews and Judaism - Third Century

BCE - Seventh Century CE

Edited by Naomi Koltun-Fromm and Gwynn Kessler

A Companion to the Archaeology of Early Greece and the Mediterranean

Edited by Irene S. Lemos and Antonios Katsanas

A Companion to Assyria

Edited by Eckart Frahm

A Companion to Sparta

Edited by Anton Powell

A Companion to Greco-Roman and Late Antique Egypt

Edited by Katelijn Vandorp

A Companion to Ancient Agriculture

Edited by David Hollander and Timothy Howe

A Companion to North Africa in Antiquity

Edited by Bruce Hitchner

A Companion to the Hellenistic and Roman Near East

Edited by Ted Kaizer

A Companion to Greek Warfare

Edited by Waldemar Heckel, E. Edward Garvin, John Vanderspoel, and Fred Naiden

Literature and Culture

A Companion to Greek and Roman Music

Edited by Tosca Lynch and Eleonora Rocconi

A Companion to Classical Receptions

Edited by Lorna Hardwick and Christopher Stray

A Companion to Greek and Roman Historiography

Edited by John Marincola

A Companion to Catullus

Edited by Marilyn B. Skinner

A Companion to Roman Religion

Edited by Jörg Rüpke

A Companion to Greek Religion

Edited by Daniel Ogden

A Companion to the Classical Tradition

Edited by Craig W. Kallendorf

A Companion to Roman Rhetoric

Edited by William Dominik and Jon Hall

A Companion to Greek Rhetoric

Edited by Ian Worthington

A Companion to Ancient Epic

Edited by John Miles Foley

A Companion to Greek Tragedy

Edited by Justina Gregory

A Companion to Latin Literature

Edited by Stephen Harrison

A Companion to Greek and Roman Political Thought

Edited by Ryan K. Balot

A Companion to Ovid

Edited by Peter E. Knox

A Companion to the Ancient Greek Language

Edited by Egbert Bakker

A Companion to Hellenistic Literature

Edited by Martine Cuypers and James J. Clauss

A Companion to Vergil's Aeneid and its Tradition

Edited by Joseph Farrell and Michael C. J. Putnam

A Companion to Horace

Edited by Gregson Davis

A Companion to Families in the Greek and Roman Worlds

Edited by Beryl Rawson

A Companion to Greek Mythology

Edited by Ken Dowden and Niall Livingstone

A Companion to the Latin Language

Edited by James Clackson

A Companion to Tacitus

Edited by Victoria Emma Pagán

A Companion to Women in the Ancient World

Edited by Sharon L. James and Sheila Dillon

A Companion to Sophocles

Edited by Kirk Ormand

A Companion to the Archaeology of the Ancient Near East

Edited by Daniel Potts

A Companion to Roman Love Elegy

Edited by Barbara K. Gold

A Companion to Greek Art

Edited by Tyler Jo Smith and Dimitris Plantzos

A Companion to Persius and Juvenal

Edited by Susanna Braund and Josiah Osgood

A Companion to the Archaeology of the Roman Republic

Edited by Jane DeRose Evans

A Companion to Terence

Edited by Antony Augoustakis and Ariana Traill

A Companion to Roman Architecture

Edited by Roger B. Ulrich and Caroline K. Quenemoen

A Companion to Sport and Spectacle in Greek and Roman Antiquity

Edited by Paul Christesen and Donald G. Kyle

A Companion to Plutarch

Edited by Mark Beck

A Companion to Greek and Roman Sexualities

Edited by Thomas K. Hubbard

A Companion to the Ancient Novel

Edited by Edmund P. Cueva and Shannon N. Byrne

A Companion to Ethnicity in the Ancient Mediterranean

Edited by Jeremy McInerney

A Companion to Ancient Egyptian Art

Edited by Melinda Harwig

A Companion to the Archaeology of Religion in the Ancient World

Edited by Rubina Raja and Jörg Rüpke

A Companion to Food in the Ancient World

Edited by John Wilkins and Robin Nadeau

A Companion to Ancient Education

Edited by W. Martin Bloomer

A Companion to Ancient Aesthetics

Edited by Pierre Desrie & Penelope Murray

A Companion to Roman Art

Edited by Barbara Borg

A Companion to Greek Literature

Edited by Martin Hose and David Schenker

A Companion to Josephus in his World

Edited by Honora Howell Chapman and Zuleika Rodgers

A Companion to Greek Architecture

Edited by Margaret M. Miles

A Companion to Plautus

Edited by Dorota Dutsch and George Fredric Franko

A Companion to Ancient Near Eastern Languages

Edited by Rebecca Hasselbach-Ande

A Companion to Ancient Greece and Rome on Screen

Edited by Arthur J. Pomeroy

A Companion to Euripides

Edited by Laura K. McClure

A Companion to Ancient Near Eastern Art

Edited by Ann C. Gunter

A Companion to Ancient Epigram

Edited by Christer Henrikén

A Companion to Late Antique Literature

Edited by Scott McGill and Edward Watts

A Companion to Religion in Late Antiquity

Edited by Josef Lössl and Nicholas Baker-Brian

A Companion to Aeschylus

Edited by Peter Burian

A COMPANION TO THE ACHAEMENID PERSIAN EMPIRE

Notes on Contributors

Javier Álvarez-Mon is Professor in Near Eastern Art and Archaeology at Macquarie University, Sydney, Australia. His primary research interests are the art, archeology, and culture of the ancient Iranian civilizations of Elam and early Persia, and the study and preservation of the cultural heritage of ancient Iran.

Reinhold Bichler is Professor Emeritus of Ancient History at the University of Innsbruck, Austria. His main research subjects are the history of political ideas, especially ancient utopias, Greek historiography and ethnography, especially Herodotus and Ctesias, and the reception of ancient history, in particular Alexander and the concept of Hellenism.

Carsten Binder teaches Ancient History at the University of Duisburg-Essen. Besides the history of the Achaemenid Empire his scholarly work focuses on ancient historiography, biography, and ethnography.

Dilyana Boteva-Boyanova is Professor at the St Climent Ohridski University of Sofia. The focus of her research is the history and culture of ancient Thrace both during the 1st millennium BCE and within the Roman Empire (1st -4th century CE). She has authored three books and edited seven miscellanea.

Rémy Boucharlat is a Senior Researcher Emeritus at the CNRS, at the University of Lyon, France. He took part in excavations at Susa and Tureng Tepe (Iran). Later he directed excavations in the UAE. Between 1999 and 2009 he conducted archeological reconnaissances at Pasargadae and Persepolis, and took part in excavations in southern Central Asia. Most of his books and articles concern the archeology of the first millennium BCE, the Achaemenid and Sasanian empires in Iran, and the Persian Gulf.

Anna Cannavò is researcher at the Centre National de la Recherche Scientifique, Maison de l'Orient, Lyon (France). She is director of the French archeological mission at Amathus. She specializes in the history and epigraphy of the Cypriot kingdoms.

Touraj Daryaei is the Maseeh Chair in Persian Studies and the Director of the Dr. Samuel M. Jordan Center for Persian Studies & Culture at the University of California, Irvine. He works on the history and culture of the ancient Iranian world.

Julian Degen holds a post-Doc position at the University of Trier. He received his PhD from Innsbruck in 2020. His main research interests are Greek historiography, Alexander the Great, intercultural contacts between East and West, and Ancient Near Eastern history of the first millennium BCE.

Elsbeth R.M. Dusingberre is Professor in Classics at the University of Colorado and author of *Aspects of Empire in Achaemenid Sardis* (2003), *Gordian Seals and Sealings* (2005), and *Empire, Authority, and Autonomy in Achaemenid Anatolia* (2013). She studies the seal impressions on the Persepolis Fortification Archive Aramaic tablets and Gordian's cremation burials.

Josette Elayi is Honorary Researcher at the French National Council of Scientific Research. She is the author of 25 books specializing in Phoenician studies, three books specializing in Assyrian studies, two essays related to the future of ancient history, and six novels. She created and edits the journal *Transeuphratène* and the collection of *Supplements to Transeuphratène*.

Mark B. Garrison holds the Alice Pratt Brown Distinguished Professorship in Art History in the Department of Art and Art History at Trinity University in San Antonio, Texas. His primary research interests are the glyptic arts of ancient Iran and Iraq in the first half of the first millennium BCE.

Jean-Jacques Glassner is Director of Research Emeritus, a former member of CNRS, and taught at Ecole des Hautes Etudes en Sciences Sociales. His publications include *The Invention of Cuneiform* (2003) and *Mesopotamian Chronicles* (WAW 19, Society of Biblical Literature, 2004).

David F. Graf has taught at the University of Miami since 1986 as a specialist in the history and archeology of the Greco-Roman Near East, with a specialty in Arabia. He has participated in the Achaemenid History Workshops, and published essays on Greek–Persian relations and Persian administration.

Birgit Gufler is a PhD Student at the University of Innsbruck. Her main research interests are Greek historiography and ethnography as well as the contacts between Greece and the Ancient Near East.

Holger Gzella, born in 1974 in Germany, is Full Professor of Old Testament at Munich University. His main interests are the historical-comparative grammar of the Semitic languages and the cultural history of Syria–Palestine in Antiquity. He is a member of, among others, the Royal Netherlands Academy of Arts and Sciences.

Ivo Hajnal is Professor for Linguistics at the University of Innsbruck. His research focuses on comparative and historical linguistics, Mycenaean Greek, and the languages of Asia Minor in the second to first millennium BCE.

Arnulf Hausleiter is a Researcher in the Orient Department of the German Archaeological Institute (DAI, Germany) and has been teaching at Freie Universität Berlin since 1997. He has been excavating at the oasis of Taymā' since 2004 and published on the archeology of northwest Arabia and northern Mesopotamia in the Bronze and Iron Ages

Sandra Heinsch is Associate Professor of Near Eastern Archaeology at the University of Innsbruck. She specializes in the archeology of the first millennium BCE in Mesopotamia and South Caucasus. She is currently conducting excavations in South Caucasus and Iran. Among her recent works is the presentation of the Austrian excavations in Borsippa, Iraq.

André Heller is Lecturer in Ancient History at the Julius-Maximilians-Universität Würzburg. His main research interests are the Ancient Near East in the first millennium BCE, the Hellenistic states, Roman policy in the East, and the northwestern provinces of the Roman Empire.

Wouter F.M. Henkelman is Associate Professor of Elamite and Achaemenid Studies at the École Pratique des Hautes Études (Paris). Among other interests, he specializes in Achaemenid Elamite sources from the Persian Empire and is involved in editing the Elamite Fortification texts from Persepolis as well as the Elamite version of the Bisotun inscriptions of Darius I.

Matthias Hoernes is postdoc assistant in Greek archaeology at the University of Vienna, Austria. He is interested in the history of Iran, the funerary archeology of pre-Roman Italy, and transcultural encounters and dynamics in the Iron Age -Archaic Mediterranean, especially in Sicily and southern Italy.

Bruno Jacobs is Professor for Ancient Near Eastern Studies at the University of Basel. His main interests are the archeology and history of the first millennium BCE, especially the Achaemenid Empire, interrelations of the Ancient Near East with the Mediterranean, the Parthian Empire, and Commagene.

Michael Jursa is Professor of Assyriology at the University of Vienna. Recent publications include *Aspects of the Economic History of Babylonia in the First Millennium BC* (2010) and, with Eckart Frahm, *Neo-Babylonian Letters and Contracts from the Eanna Archive* (2011).

Oskar Kaelin is Near Eastern Archaeologist at the University of Basel, Switzerland. He is a researcher in a project editing historical sources on the Phoenicians, associate editor in the project "Iconography of Deities and Demons in the Ancient Near East" (Zurich/Fribourg), and co-director of the excavation in Tall al-Hamidiya, Syria.

Deniz Kaptan, Adjunct Professor at the Department of Anthropology, University of Nevada Reno, is the author of *The Daskyleion Bullae: Seal Images from the Western Achaemenid Empire* (2002). She is preparing a publication about seals and seal use in Anatolia during the Achaemenid Empire period.

Florian S. Knauss received his PhD in Classical Archaeology at the *Universität des Saarlandes* in 1993. In 1994–2001 he was Assistant Professor in Münster, and from 2001 to 2011 Curator at the Staatliche Antikensammlungen und Glyptothek München. Since 2011 he has been Director of these museums. He has been concerned with Achaemenid remains in the Caucasus region since 1994, for example excavations in Georgia (1994–2000) and Azerbaijan (2006–2019).

Reinhard G. Kratz, born in 1957, has been Professor for Hebrew Bible at Georg-August-University since 1995 and a member of the Academy of Sciences and Humanities Göttingen since 1999. His main fields of research are the history of the biblical literature, Ancient Near Eastern and biblical prophecy, and Judaism in Persian and Hellenistic-Roman times (including the Dead Sea Scrolls).

Amélie Kuhrt is Professor Emeritus of Ancient Near Eastern History at University College London and a Fellow of the British Academy. She is author of *The Ancient Near East* (2 vols., 1995) and *The Persian Empire – A Corpus of Sources from the Achaemenid Empire* (2 vols., 2007). Her research areas are Mesopotamia in the first millennium BCE and the Achaemenid and Seleucid empires. She co-organized and co-edited with Heleen Sancisci-Weerdenburg five of the Achaemenid History Workshops.

Walter Kuntner is Senior Researcher at the University of Innsbruck. He has conducted numerous excavations in the Near East and specializes in the archeology of the first millennium BCE. He is currently conducting excavations in Aramus, Armenia, Khovle Gora, Georgia, and Chors, Iran.

Angelika Lohwasser is Full Professor for Egyptology at the University of Münster, Germany. She is an expert in the archeology and history of Nubia. Other research interests are material culture, iconography in ancient Nubia and Egypt, funerary archeology, and conceptions of the body.

Andreas Mehl, born in 1945, was between 1985 and 2011 a Professor for Ancient History at the universities of Koblenz-Landau, Darmstadt, Erlangen-Nürnberg, and Halle-Wittenberg. His fields of research are Cyprus in antiquity, Hellenism (Seleucid Empire), ancient (Roman) historiography, and history of culture.

Mischa Meier is Professor of Ancient History at the University of Tübingen. His main focus is Greek history in the archaic and classical eras, as well as Roman history in the early and late Imperial period and in late antiquity.

Wolfgang Messerschmidt is Free Scholar at Cologne University, Germany. His special research areas are the archeology and history of the Ancient Middle East in

Hellenistic times, Babylon from the Neo-Babylonian to the Hellenistic period, and Achaemenid Iran.

Ali Mousavi studied in Lyon, France, and obtained his PhD in Near Eastern Archeology from the University of California, Berkeley. He is the author of *Persepolis. Discovery and Afterlife of a World Wonder* (2012). He teaches Iranian archeology at the University of California, Los Angeles.

Krzysztof Nawotka, educated at Wrocław, Oxford, and Columbus, OH (PhD in Classics 1991), is Ancient History Professor at the University of Wrocław, Poland. His principal books are *The Western Pontic Cities: History and Political Organization* (1997), *Boule and Demos in Miletus and its Pontic Colonies* (1999), *Alexander the Great* (2010), *The Alexander Romance by Ps.-Callisthenes: A Historical Commentary* (2017), and *Epigraphic Culture in the Eastern Mediterranean in Antiquity* (2020).

Astrid Nunn is a Near Eastern Archaeologist, former adjunct Professor at the University of Würzburg (Germany). Her main fields of interest are the Achaemenids in the Levant, polychromy, and iconography.

Daniel T. Potts is Professor of Ancient Near Eastern Archaeology and History at the Institute for the Study of the Ancient World, New York University. He received his PhD from Harvard and has worked extensively in Iran, both at Tepe Yahya and in the Mamasani region.

Joachim Friedrich Quack studied Egyptology, Semitic Languages, Biblical Archaeology, Assyriology, and Prehistory at the universities of Tübingen and Paris. He is Director of the Institute of Egyptology at Heidelberg University. He is a full member of the Heidelberg Academy of Sciences and a foreign member of the Danish Academy of Sciences and Letters. He was awarded the Leibniz Prize in 2011.

Claude Rapin is an Archeologist and Researcher at the CNRS (UMR-8546), École normale supérieure, Paris, “Archéologies d’Orient et d’Occident et textes anciens (AOROC)” and Privatdozent at the University of Lausanne. He has undertaken excavations in Afghanistan (Ai Khanum) and Uzbekistan (Samarkand-Afrasiab, Koktepe, Iron Gates near Derbent, Kindikli-tepe, Yangi-rabat, Sangir-tepe). He has published on the archeology, history, and historical geography of Central Asia.

Robert Rollinger is Full Professor at the Department of Ancient History and Ancient Near Eastern Studies, Leopold-Franzens Universität Innsbruck since 2005. From 2011 to 2015 he was Finland Distinguished Professor at the Department of World Cultures, University of Helsinki, from 2021–2025 he holds a NAWA chair as Visiting Professor at the University of Wrocław, Poland (Programme “From the Achaemenids to the Romans: Contextualizing empire and its longue-durée developments”). His

main research interests are Greek historiography, history of the first millennium BCE, and comparative empire studies.

Adriano V. Rossi is Professor Emeritus of Iranian philology at L'Orientale University, Naples, where he was Rector from 1992 to 1998. He is a member of many academies and scientific societies, including Accademia dei Lincei, Rome. His main subjects (with more than 200 publications) are Iranian linguistics/philology and dialectology. Since 2002 he has been Director of the international project DARIOSH (Digital edition of the Achaemenid royal inscriptions) and since 2016 President of ISMEO-Rome.

Kai Ruffing is Professor for Ancient History at the University of Kassel, Germany. His main interests in research include the social and economic history of the ancient world, classical historiography, and transcultural contacts between Mediterranean and Middle Eastern cultures in antiquity.

Mirjo Salvini has been Director of the Institute for Aegean and Near Eastern Studies, Rome. His special research focus is on philology and history of the Ancient Near East in very broad terms. He has done extensive field work in Armenia, Turkey, Syria, and Iran. He has edited and published cuneiform texts from Boghazköy (Hittite), Syria (Akkadian and Hurrian), Iran (Linear Elamite), and Armenia, Turkey (Urartian). His *opus magnum* is the publication of the “Corpus dei testi urartei” (five volumes, 2008–2018).

Rüdiger Schmitt, Emeritus Professor of Comparative Philology and Indo-Iranian Studies at Saarland University in Saarbrücken, is a specialist in ancient Iranian languages and onomastics, but has worked also on the Greek and Armenian languages. He is co-editor of the *Iranisches Personennamenbuch* of the Austrian Academy of Sciences.

Gundula Schwinghammer holds a PhD in Ancient History at the University of Innsbruck. Her research deals chiefly with the Achaemenid Persian empire and regime changes in the Ancient Near East.

Sören Stark is Assistant Professor for Central Asian Archaeology at the Institute for the Study of the Ancient World at New York University. His research focuses on Central Asian archeology and history from the Early Iron Age to the Islamic Middle Ages, in combination with archeological fieldwork in Bukhara/Uzbekistan.

Matthew W. Stolper is the John A. Wilson Professor Emeritus of Oriental Studies and Director of the Persepolis Fortification Archive Project at the Oriental Institute of the University of Chicago.

David Stronach was Professor Emeritus of Near Eastern Archaeology at the University of California, Berkeley. He has directed excavations at Pasargadae, Tepe Nush-i Jan,

Nineveh, and Erebuni. He had a particular interest in the archeology and history of the early Achaemenids, the Medes, the Neo-Assyrians, and the Urartians.

Jan Tavernier (PhD 2002, KU Leuven) is professor in Ancient Near Eastern Studies at the Université Catholique de Louvain (Belgium). His research axes are Elamite history and linguistics, Achaemenid history, Ancient Near Eastern onomastics, and Ancient Near Eastern linguistic history of the first millennium BCE.

Gocha R. Tsetskhladze taught at London and Melbourne, specializing in ancient Greek colonization and the archeology of the Mediterranean, Black Sea, Caucasus, and Anatolia in the first millennium BCE. For 30 years he has excavated Greek colonial sites around the Black Sea and at Pessinus in central Anatolia. He has published extensively. He is affiliated to Linacre College, Oxford.

Günter Vittmann studied Egyptology and ancient Semitic languages. He earned his PhD 1977 in Vienna (*Priester und Beamte im Theben der Spätzeit*, published 1978) and his Habilitation in 1994 at Würzburg (*Der demotische Papyrus Rylands 9*, published 1998). He was appointed Associate Professor at Würzburg in 2001. His special fields of research are Egyptian philology, Demotic and Hieratic, and relations between Egypt and her neighbors.

Melanie Wasmuth is a Docent in Egyptology and Ancient Near Eastern Studies at the University of Helsinki and affiliated to the Egyptology Section of the University of Basel. She specializes in the impact of cross-regional migration, cultural encounters and political expansion on material culture and identity constructions in the first millennium BCE.

Josef Wiesehöfer received his PhD in 1977 (Münster) and Habilitation in 1988 (Heidelberg). From 1989 to 2016 he was Full Professor of Ancient History at the Department of Classics at the Christian-Albrechts Universität Kiel. His main research interests are the history of pre-Islamic Persia and intercultural exchange between East and West in antiquity. He has published extensively on ancient Persia, with a special interest in Parthian and Sasanian history.

Michael Zahrnt was Professor of Ancient History at the University of Cologne. His research has focused on Greek History from the Archaic Age to the expansion of Rome, with special emphasis on Macedonia and Alexander the Great; and on the emperor Hadrian.

SECTION I

INTRODUCTION

Bruno Jacobs and Robert Rollinger

In 262 CE an army of Roman and Greek forces, led by the Roman Marianus (then probably governor of the Roman province of Achaea/Greece), gathered at Thermopylae to ward off an expected attack by Gothic invaders from the north.¹ In the wake of the military preparations to defend the pass, Marianus addressed the assembled Greek soldiers and fired up their emotions by referring to the achievements of their ancestors. This splendid episode was discovered only recently on a palimpsest in the Austrian National Library and convincingly identified as a fragment of the lost *Scythica* of the Greek author Herennius Dexippus (third century CE). The episode runs as follows:

(7) ‘O Greeks, the occasion of our preservation for which you are assembled and the land in which you have been deployed are both truly fitting to evoke the memory of virtuous deeds. For your ancestors, fighting in this place in former times, did not let Greece down and deprive it of its free state, for they fought bravely in the Persian wars and in the conflict called the Lamian war, and when they put to flight Antiochus, the despot from Asia, at which time they were already working in partnership with the Romans who were then in command. (8) So perhaps it may be good fortune, in accordance with the *daimonion*, that it has been allotted to the Greeks to do battle against the barbarians in this region (indeed your own principles of fighting the wars have turned out to be valid in the past). But you may take confidence in both your preparation for these events and the strength of the region – as a result of which, in previous attacks you seemed terrifying to the enemies’. (Codex *Vindobonensis Hist. gr.* 73, ff. 192^v–193^r after Mallan and Davenport 2015: p. 206)

A Companion to the Achaemenid Persian Empire, Volume I, First Edition.

Edited by Bruno Jacobs and Robert Rollinger.

© 2021 John Wiley & Sons, Inc. Published 2021 by John Wiley & Sons, Inc.

The passage is remarkable for many reasons. On the one hand, it reveals a specific *lieu de mémoire* where the Persian Wars (actually the “Median [Wars]”: *tois Mēdikois*) still had some relevance during the Roman Empire. On the other hand, at least in our text, this relevance is of somewhat reduced significance. Whereas from a modern perspective a battle at the famous site of Thermopylae would above all call to mind the celebrated event of 480 BCE, the Roman perspective of the third century CE is a rather different one.² To be sure, Thermopylae is still a battlefield that recalls the invasion by the Achaemenid Persian Empire, but this is just one event among others, and, as it appears, not the most important one. Thermopylae seems to be about equally significant as the location of a comparable event during the Lamian War (323–322 BCE), and both occurrences are far outstripped by the Syrian War (192–188 BCE): this was the war that Rome fought against the Seleucid king Antiochus III (223–187 BCE), and it is Antiochus – and not primarily the Persians – who is introduced as the ultimate representative of Asian hubris, threat, and outreach. What can we learn from this episode and what is its relevance in the introduction to a new Companion to the Achaemenid Persian Empire?

Historians are nowadays well aware of the fact that their understanding and reconstruction of history are shaped both by tradition and by the view of past and present current in their own time. But it is not always easy for them to escape from this situation and find their own perspective.

From the very beginning, reconstruction of the history of the Achaemenid Persian Empire was affected by a point of view that focused primarily on two events: the first was the Persian Wars at the beginning of the fifth century BCE and the second the downfall of the empire at the end of the fourth century BCE. Both events became part of well-designed master narratives that presented the empire as a colossus with feet of clay, and the empire’s defeats were celebrated as the heroic deeds of opponents fighting for freedom against an Asian craze for the huge and spectacular. Thus, the Persian Wars became a climax in the conflict between Greek (and European) liberty and Asian despotism, and Alexander III was staged as “Alexander the Great,” a heroic conqueror king, while other relevant aspects of his “career” such as aggression, violence, and destruction moved entirely into the background. The sources that established these master narratives originated without exception from the western fringes of the empire, but this did not impair their success. On the contrary, such narratives became an integral part of classical and later European history, one that shaped perception not only of the “oriental” Other and of Asia but also of their purported European antithesis. Although, as we have seen, the importance of the Persian Wars within the general course of history was somewhat

relativized during the Roman Empire (cf. Spawforth 1994; Rollinger 2019), our view of the Achaemenid Persian Empire remained primarily determined by other sources and their presentation of the impressive defeats suffered by the Persians in the fifth and fourth centuries BCE (cf. Wiesehöfer 1992, 2002, 2003, 2013).

The resulting lopsided and distorted view is still frequently encountered, but among specialists a considerable change of perspective has taken place in the last 35 years. During the 1980s the Achaemenid History Workshops paved the way for a new understanding of the Achaemenid Persian Empire.³ This was, on the one hand, due to the development of a post-colonial approach in Ancient Studies in which Graeco- and Eurocentrism were strongly challenged. On the other hand, more and more sources in different languages and writing systems emerged from the various regions of the empire and were subjected to proper historical analysis. The result was in effect a new discipline, Achaemenid History Studies, and a complete transformation of the Achaemenid Persian Empire as an object of historical investigation: no longer conceptualized as a side-show of the Classical World, it became an entity in its own right deserving of study from a variety of angles and in a thoroughly interdisciplinary fashion. It is to this approach that the present publication is indebted.

In contrast to earlier research, which mainly looked in one direction (the West *or* the East), we conceptualize the Achaemenid Persian Empire as the center of an interrelated network that connected the Eurasian and African continents for the first time and in an entirely new way. With its outreach into the Mediterranean on the one side and toward the Central Asian and Indian worlds on the other, the Achaemenid Persian Empire established and energized a new dimension of connectivity, in which an imperial structure with its dynamic fringes was a key factor in creating and disseminating the new ideas that increasingly shaped an interconnected, proto-globalized world. This applies to numerous aspects of culture, thought, and belief, and it gives rise to new research objectives that can be achieved only within the sort of genuinely inter- and transdisciplinary framework that reflects the still very recent global turn.

The present *Companion to the Achaemenid Persian Empire* aims to approach the empire from a multi-angled and transdisciplinary perspective that takes into account all of the currently available sources, written, artistic, and archaeological. Political history (traditionally a primary focus) is now just one of many topics that illustrate the fascination and the multifaceted nature of what was truly the first empire in world history. The study of *Nachleben* and of the history of perception up to the present day is taken to be as important as the history of the empire itself, a history which is presented in its multiregional

dimensions. Apart from the introduction, the *Companion* is divided into 12 sections with a total of 110 chapters. Specialists from all over the world and from various scientific disciplines have contributed their expertise and knowledge.

During its existence there was no other political formation that could match the Achaemenid Empire in dimensions and outreach. The already huge territories of several preceding empires (those of the Assyrians, Babylonians, Egyptians, and Lydians) were united in a single state that then expanded further toward Africa, Europe, Central Asia, and India. These dimensions, as well as the empire's highly diversified natural geography, are dealt with in Sections II (Geography and Demography: chapters 1–5) and V (Structures and Communication: Chapters 53–58) of the present volume.

As already indicated, the study of the Achaemenid Persian Empire has to confront and satisfactorily address certain specific challenges. Among these is the need for a critical and balanced review of all available sources, taking into consideration each source's *Sitz im Leben*, perspective, intention, and contemporary setting. At the beginning of the twenty-first century, it is no longer adequate to come to the history of the Achaemenid Empire solely through the lens of Greek authors such as Herodotus, Ctesias, or Xenophon. The labeling of such authors, or at least some of them, as historiographers by modern scholarship obscures the fact that what they present is by no means history in the modern sense of the word. They are better seen as offering a literary representation of the Greeks' powerful, daunting, and fascinating eastern neighbor. Their perspective unites research and knowledge with literary creativity, fiction, and imagination, and in writing as they did, they both respected the expectations of their Greek audience, including its desire for sensational stories, and exercised their power to create and shape identities. All of this requires critical reading and investigation by the modern historian who is interested in not only a specific "view of history," literary tradition, and pattern of thought but a multifaceted approach to the historic past.

An enormous amount of indigenous written material originating inside the Achaemenid Persian Empire survives, and the stock of what is available for study is increasing all the time. The texts in question encompass royal inscriptions and archival documents in a number of languages and writing systems, originating from various contexts in the different regions of the empire. These sources must also, of course, be approached by the modern historian in a critical frame of mind. What they reveal is often an entirely different perspective from that of the western sources. They document administrative actions and decisions, processes in the royal, provincial, or regional bureaucracy, correspondence between court and officials, temple administration, trade, and entrepreneurship, crime and punishment, and even, if only in glimpses, daily

life, but also royal self-presentation, ideology, and the self-perception of Great Kings who were convinced that they ruled the world by divine favor.

Obviously, there are major obstacles and difficulties in dealing adequately with this vast amount of material. The texts are written in a variety of languages and writing systems and they belong to different local contexts and traditions. The Achaemenid Persian state was a true empire in terms of its multilingualism and its ability to bring together distinct age-old traditions of writing and thought under a single roof. There is nobody who could deal with the totality of this heterogeneous and diversified material alone. The task has to be shared and the issues discussed in a transdisciplinary approach that is interested not only in a single archive and region but in the empire as a whole. Only in this manner is it possible to evaluate the importance and quality of each individual source for the reconstruction of the political, cultural, social, economic, and religious history of the empire. It will be no surprise that there is still considerable dissent among scholars about how this can be achieved successfully and what these reconstructions might look like. These written sources in their entirety, structured according to the individual languages involved, are presented in this *Companion* in Section III-A (Written Sources: Chapters 6–14).

In recent decades, extensive archeological fieldwork has been undertaken in a wide range of the modern states and regions that are situated on the territory of the former Achaemenid Empire. It is important to stress that archeological sources of any kind are as essential as written ones for reconstructing the past and they must be taken into account appropriately by the modern historian. One aim of the *Companion* is therefore to offer an up-to-date survey of the archeological state of the art from Kazakhstan to the Sudan and from India to the Aegean. Section III-B (Archeological Sources: Chapters 15–24) presents an overview of sites, excavations, and finds, structured by major geographical regions.

Section IV (History: Chapters 25–52) is divided into three subsections: A Predecessors of the Persian Empire and Its Rise, B From Gaumāta to Alexander, and C Under Persian Rule. As is immediately obvious, it has a much wider focus than the history of the empire itself. This reflects our intention to situate and understand the empire within the broader historical developments of the first millennium BCE and their specific contexts. The empire, on the one hand, transcended the boundaries of its ancient Near Eastern predecessor states, but on the other hand it followed their general trajectories. Some of its core areas were indeed “Iranian”; nevertheless the Achaemenid Persian Empire was not an Iranian state but a multiethnic and multiregional giant that drew from age-old Near Eastern traditions while at the same time introducing novel agendas and traits. This also, incidentally, applies *mutatis mutandis* to what followed with and after the conquest of the empire by Alexander III.

Chapters 25–28 are, therefore, devoted to Media, Urartu, Assyria, Babylonia, and Elam. The great conquests of Cyrus and Cambyses are also part of subsection A, since the usurpation of the Persian throne by Darius I marks a major change in the history of the empire. Chapters 30–33 deal with the history of the Achaemenid Empire in its narrower sense, from the crisis after the death of Cambyses and Darius I's seizure of power through the fifth and fourth centuries BCE to Darius III and the conquest by Alexander.

Subsection C (Under Persian Rule: Chapters 34–52) already mediates between Sections IV and V, since it illustrates the empire's astonishing capacity to create unity from diversity. This subsection offers a survey of all the major regions of the empire and the local dimensions of its history through the 200 years of its existence. The success of the empire was due to the fact that its developed structures and bureaucracies had local as well as transregional trajectories. It is this overarching and general layout that is the main focus of Section V (Structures and Communication: Chapters 53–58). As has only become properly evident in recent years, the empire maintained already established local structures, at least to a certain extent, and developed an imperial and transregional superstructure that guaranteed its efficiency in collecting taxes and manpower and in maintaining communications between Central Asia, India, Iran, Mesopotamia, Egypt, Syria, and Anatolia.

The administrative and economic dimension of the empire's structure is the general focus of Section VI (Administration and Economy: Chapters 59–69), which is organized into three subsections: A Imperial Administration, B Local Administration, and C Economy. It has already been stressed that a major characteristic of the empire's highly developed bureaucratic apparatus was the interplay between local and transregional structures. This interplay is highlighted by a variety of sources and archives that run from Egypt across Syria, Asia Minor, and Babylonia to Fars and Central Asia. The focus is not only on structures but also on persons, and on rulers as well as the ruled, i.e. on the development of imperial elites with estates all over the empire and their transregional radius of engagement as well as on locals who kept the empire's structures going by paying taxes and delivering soldiers and manpower. The chapter also deals with transregional migration and deportations. The background to the latter is often difficult to grasp in detail; an element of punishment may sometimes be combined with a plan to develop underpopulated and economically weak regions of the empire. The economic aspect of imperial administration is more comprehensively dealt with in the last subsection, which discusses taxes and tribute, temple economy, and entrepreneurship and "banks."

Section VII (Society and Politics: Chapters 70–78) is concerned with another structural aspect, namely the sociohistorical dimension. It unfolds the social makeup of the empire, with its wide reach from slave to Great King.

Because of the source situation, the imperial centers with their residences, courts, and court life feature heavily in this context. Since the satraps in the empire's provinces tended to mirror and imitate the Great Kings' attitudes and actions, this chapter reveals an imperial dimension as well. It describes places and techniques of imperial politics, such as banqueting and gift exchange, and highlights how the king and his court dealt with diplomacy and jurisdiction. Royal enactments were staged and performed in a ceremonial setting in which clothes and insignia played an important role. But it is not only the official aspects of monarchic rule that are taken into account; attention is also paid to the Great Kings' leisure activities, among which hunting wild game loomed especially large. Finally, as in all societies throughout world history, sex and gender are an integral part of social life that have to be given appropriate consideration.

Section VIII (The Persian Empire at War: Chapters 79–82) investigates the military dimension. It goes without saying that the empire was the major military superpower of its time. Its ability to mobilize armies with manpower from all over its territory was more than impressive. Moreover, it was the first Near Eastern empire to build up a navy as an independent force that matched the quality and strength of its vast ground forces. All of this comes through in Greek reports of the so-called Persian Wars, although, ironically, these accounts do not explicitly highlight the empire's organizational and infrastructural strength in mounting a campaign by a combined land and naval force at its outmost western fringes, but instead accentuate the Great Kings' hubris and arrogance. However, Chapters 79–82 do not focus only on the organizational skills of the empire in raising and recruiting vast armies; they also investigate ideology and the specific ways in which the empire and its kings legitimated the imperial war machine.

Section IX (Religion and Worship: Chapters 83–88) deals with cult and belief in the empire. This is a subject with many facets and the six contributions cover a wide range of topics. The section is one in which dissent within modern scholarship looms particularly large. We have made a conscious choice not to harmonize these different voices and opinions but to make plain the diversity of conceptions and reconstructions found in modern research. In this way the reader can get a proper flavor of the controversies surrounding the religion of Achaemenid rulers and their elites, and of the question as to whether their belief system may be described as Zoroastrianism, Mazdaism, or neither. The section also develops a broader perspective, however, by focusing on funerary customs as well as on the diverse practices of worship encountered both within the empire's heartland and across its various regions.

Section X ("*Geistesgeschichte*," Science, and Technology: Chapters 89–93) pinpoints intellectual movements, education, and learning, as well as science and techniques. In doing so it touches on a variety of topics. Contributions on

Astronomy and Astrology, Physicians and Medicine, and Techniques of Art and Architecture (Chapters 90, 92 and 93) deal with the empire's hard sciences. School, Erudition, and Wisdom (Chapter 89) focuses on the empire's educational system, while the provocatively titled contribution on Persian "Enlightenment" (Chapter 91) draws attention to intellectual accomplishments within the empire that are commonly ascribed only to its western neighbors.

Section XI (The Perspective of Art: Chapters 94–96) introduces the major categories of artistic production in the empire. Alongside statuary, relief sculpture, and minor arts, this includes poetry, music, and dance.

The last two extensive sections of the *Companion* focus in an innovative way on the empire's *Nachleben*. This is not just an appendix but a substantive part of the book in its own right, and it demonstrates clearly that the empire survived its downfall. Section XII (Reception and Heritage: Chapters 97–105) is divided into the three subsections: A Modes of Perception, B The Local Heritage, and C Contemporary Perception. Its nine contributions guide the reader through the empire's reception history, starting with Classical Antiquity and ending with the Popular Culture of our own times. Section XIII (History of Research: Chapters 106–110) concludes the *Companion* with a balanced overview of the ways in which the empire has been investigated by researchers from the major regions of the scientific world and highlights the principal trajectories and *Leitfragen* of this research through the past 100 years and more.

It will be no surprise that this *Companion* has quite a long history of its own. From its very beginning, with the initial conceptualization of the project and the first contacts with the publishing house in Berlin in August 2009, through the invitations to contributors and the gathering and editing of the papers, and then on to the eventual publication of the volume, many years have gone by. As always, the editors planned to finish their work much earlier than actually turned out to be possible. There were many reasons for this. On the one hand, the *Companion* set itself ambitious goals. It was our aim not just to publish a further volume on the Achaemenid Persian Empire but to present an up-to-date overview of recent research that included a broad set of topics that had not previously been dealt with in such a comprehensive manner. This is especially true for the chapters on archeological research as well as for those on reception history and history of research. Many contributions to the *Companion* are therefore not just summaries but the results of very recent research agendas in their own right. On the other hand, the sheer number of contributions (110 in total) created problems of its own that had to be tackled and solved by the editors. But in the end we have made it, and we very much hope that we have been successful in presenting an overview of a kind that has never been available before.

Finally, it is our pleasure to express our gratitude to those people and colleagues without whose help the *Companion* would not have been possible.

This, of course, applies first and foremost to the 83 authors who contributed to the volume. Their competence and forbearance were essential for the result. There are also the various colleagues from the publishing house, whose friendly guidance and assistance we always enjoyed and appreciated. The editors' special thanks go to the editorial assistants at the Institut für Alte Geschichte und Altorientalistik, Universität Innsbruck, whose skill and patience made a huge contribution to the success of the editorial work: Manuel Pohl, Matthias Hoernes, Katharina Reinstadler, Sabrina Buchebner, Dolores Dollnig, Julian Degen, Florian Posselt and Clemens Steinwender. They would not have been available, of course, without generous financial assistance from the University of Innsbruck, and especially the Dean of the Historisch-Philologische Fakultät, Prof. Dr. Klaus Eisterer. Dankeschön! Very special thanks also go to Carmen Marcks-Jacobs, who adapted several plans and maps for publication in the present work. There is a German proverb that may accurately describe the long and often strenuous editorial process of this *Companion*: "Gut Ding will Weile haben." We hope that this also applies to the present publication.

NOTES

- 1 For historical context and protagonists see Mallan and Davenport 2015.
- 2 Cf. in detail Rollinger 2019.
- 3 The Achaemenid History Workshops took place between 1981 and 1990. The proceedings were published in the series *Achaemenid History* as volumes 1–8 (Leiden 1987–1994). In some respects, publications in the series *Classica et Orientalia* (Wiesbaden), especially volumes 1–3, 5–6, 13, and 15–17, 19–24 may be regarded as follow-ups to the Achaemenid History Workshops. This is certainly true so far as their scope, approach, and intention are concerned.

ACKNOWLEDGMENT

The authors are grateful to Christopher Tuplin for his assistance with the English version of this text.

SECTION II

**GEOGRAPHY
AND DEMOGRAPHY**

CHAPTER 1

Geography and Climate

Daniel T. Potts

Any attempt to describe the geography and climate of an empire faces a formidable challenge, for by definition such supra-regional states were territorially vast and, in most cases, characterized by a wide range of physical features, ecosystems, and climates. The borders of the Achaemenid Empire transected what geographers have termed interior Asia, Europe, southwest Asia, and Africa (Brice 1966: Fig. 1). The empire included the entirety of the earlier Neo-Assyrian Empire in addition to the Iranian plateau, a good portion of western Central Asia (as far east as Sogdia), the Indo-Iranian borderlands, and parts of north Africa, including Libya to the west of Egypt and Kush (Nubia) to the south. Major bodies of water, including the Aegean, Mediterranean, Red, Black, Caspian, and Arabian Seas, the Persian Gulf, and the Gulf of Oman bounded the Achaemenid satrapies. Substantial mountain ranges, including the Taurus, Amanus, Lebanon, Anti-Lebanon, Caucasus, Zagros, Kopet Dag, and Hindu Kush, constituted significant sources of timber and minerals, as well as impediments to travel, breaking up the empire into a series of basins, plateaus, and valleys connected by natural thoroughfares – seas, rivers, mountain passes, and tracks across plains and deserts.

The fundamental ecological “facts of life” did not change with the rise of the Achaemenids, of course. The Nile Valley was not suddenly more fertile, any more than the Mesopotamian plain was suddenly more saline than it had been. The cedars of Lebanon were no less abundant than they had been under the Assyrians, notwithstanding the fact that enormous quantities of timber had been harvested and sent to the Assyrian capitals; horses were no scarcer in

Media than previously; bitumen no less abundant at Hit; and lapis lazuli was just as available in Afghanistan as ever. But the sheer size of the empire required an extraordinary effort to manage it effectively and no doubt tested the capabilities of the state administrative apparatus at the same time as it helped to build considerable managerial and logistical expertise. Efficient communication across enormous distances became a *sine qua non* of imperial success and demanded regular travel on a scale scarcely seen in any period of human history prior to the creation of the Achaemenid Empire.

Within the borders of the empire, the major mountain ranges are pierced by only half a dozen major passes and these have necessarily acted as conduits for travel across the millennia. Beginning in the east these are the Khyber pass, formed by the Kabul river as it flows through the mountains of Pakistan; the Bolan pass, which pierces the hills of southwestern Pakistan where the Nari river cuts through them; the Ardewan pass in the Hindu Kush, which opens up communication between Merv in Turkmenistan and Herat in western Afghanistan, thanks to the Kushk river; the Sefid Rud gap, which bursts through the Alburz mountains, giving access from the Caspian Sea to the Iranian plateau, near Rasht; the Zagros Gates, where the Diyala river cuts through the Zagros mountains near Bisitun, providing access from the Mesopotamian plain to the Iranian plateau in the east Tigridian region; and the Cilician Gates, where a branch of the Tarsus river pierces the Taurus mountains, providing access from the western Anatolian plateau to the Mediterranean (Brice 1966: p. 28). Other important passes include the Homs Gap or Syrian Gates, where the Orontes river has cut a gap linking the Mediterranean coast with the interior of Syria, dividing the an-Nusayriyah mountains and Jebal Zawiyah, Lebanon and Anti-Lebanon mountains; the Persian Gates, in the Mamasani region of western Fars, through which most east–west traffic has to pass between Mesopotamia and the southwest Iranian lowlands (Khuzestan) to the west and the highlands around Pasargadae and Persepolis to the east (Speck 2002); and the Kotal Dukhtar, the only pass that leads from Bushehr on the Persian Gulf northwards toward Shiraz and Persepolis (Potts 2009: p. 283). There were many more passes of local importance scattered across the Achaemenid Empire, but each of these major ones can be considered “active” before, during, and after the period in question.

If Achaemenid administrators and military commanders felt that a tyranny of distance operated within the empire, it was at least mediated by effective communications that facilitated the movement of private individuals (Waerzeggers 2010), couriers (Herrenschmidt 1993; Briant 1992), armies, and officials (Hallock 1969) on foot, camel, horse, donkey, cart, barge, and boat. For the most part, travel was undertaken along roads already in existence. These included major routes that had been traversed since prehistoric times, from southern Babylonia, up the Euphrates and Tigris, and across

northern Mesopotamia, descending into Syria and the southern Levant (Halla 1964: Fig. 6); routes leading up the Tigris from Assyria to the Anatolian heartland (Halla 1964: Fig. 6; Nashef 1987; Barjamovic 2011: p. 34); routes leading from the Levant southward into Egypt (Gardiner 1920; Potts 1982; Figuera 2000); and routes leading from southern Babylonia eastward through the Zagros Gates, on to and across the Iranian plateau (Herzfeld 1907), bound for Central Asia. Local routes, already well-trodden by the Bronze Age (e.g. Ur 2009), almost certainly continued to be used as well. Guides, fast couriers, and guard stations had been known since the Bronze Age (Barjamovic 2011: pp. 38–51) and it is unlikely that the basic modalities of travel were significantly different in the Achaemenid period. Indeed, judging by the extant literary testimonia, travel in the Achaemenid period was as efficient as it was at any time prior to the development of motorized transport.

Millions of years of erosion of the folded mountain chains throughout the Achaemenid Empire, supplemented by ongoing alluviation, resulted in the infilling of numerous plains and plateaus, and the creation of large salt basins like the Dasht-e Lut and Dasht-e Kavir in Iran. True deserts like the African Sahara or the Arabian Rub' al-Khali generally lay outside the bounds of the empire, except in Libya, but gravel plains are particularly prevalent in the eastern reaches of the Achaemenid Empire. Nor were these generally mediated by appreciable rainfall, though it is clear that precipitation varied enormously across the length and breadth of the region controlled by the Achaemenids. This is scarcely to be wondered at in an empire spanning so many degrees of latitude and longitude. From the Indo-Iranian borderlands to Libya, and from the Caucasus to Oman, an enormous range of ecosystems existed within the borders of the Achaemenid Empire (Wilkinson 2003).

Generally speaking, the climate of most of the empire may be characterized as a drier, continental variant of the Mediterranean regime (Brice 1966: p. 36). Rainfall across most of the Achaemenid Empire fell in winter, the exceptions being in parts of Central Asia (Choresmia, Sogdiana), the Indo-Iranian borderlands (Sattagydia, India), the Caucasus (Armenia), and Egypt, where summer rains, influenced in the southern districts by the monsoon, were the norm. Pockets of territory in central Anatolia, around Lakes Van and Urmia, the central Iranian plateau, Sistan, and Afghanistan received rain in both seasons (Brice 1966: Fig. 9). Just as it has been in recent times (Kouchoukos et al. 1998: p. 480), inter-annual variability in precipitation was probably great. Hyper-arid zones may have received only a few dozen millimeters of rainfall each year, while sub-tropical areas like Gilan and Mazanderan received enough rainfall to enable double-cropping (e.g. growing rice in summer and wheat/barley in winter). To cite just one extreme, modern example of inter-annual variability, unusually heavy rainfall in 1968 saw the level of Lake Urmia rise by no less than 2 m. (Bottema 1986: p. 243). Fluctuations of this sort are

generally not recorded in ancient sources, with the exception of the Babylonian astronomical diaries. In addition to containing observations on the height of the Euphrates (Slotsky 1997: pp. 88–98), these mention a wide range of meteorological phenomena, including rain showers, lightning, thunder, and tornados (e.g. Sachs and Hunger 1988: p. 71, no. 384) that characterized the Babylonian winter of 384 BCE.

With every type of environment from the sub-tropical in the north to the semi-arid steppe, arid desert, and humid coasts along the Persian Gulf and Arabian Sea in the south, Iran itself is a microcosm – if one can use such a term to describe an area three times the size of France – of the diverse range of ecosystems found across the empire. In the higher ranges of the Zagros mountains, where peaks in excess of 3000 m. above sea level can be found, heavy snowfall, perennial streams, and abundant springflow are well-attested, while on the borders of Khuzestan, Sistan, Kerman, and Baluchistan, arid conditions exist in which dry-farming is impossible without the aid of irrigation. The northerly winds of the summer, coming almost entirely from the north, cause the region to become overheated. Extreme examples, such as the 120 days' wind in Sistan (Drangiana) or the *shamal* in Mesopotamia (Assyria, Babylonia) and the Gulf region (the satrapy of the Erythraean Sea and Maka), while useful for sailors, are inhibitors of agricultural development. Still, in coastal areas where agriculture was unviable except in winter, fishing and pearling, not to mention trading, were pursued in summer. Living with drought in the more southerly satrapies of the empire would have been the norm for six months of the year whereas in the more temperate latitudes a far more Mediterranean climate was conducive to continuous agricultural production, punctuated by severe winters with heavy frosts and snowfalls, rather than hyper-arid summers.

Climate and topography necessarily had an enormous influence on flora and fauna throughout the Achaemenid Empire. Once again, given its size, it is scarcely surprising that the empire spanned the Mediterranean, Euro-Siberian, western and central Asiatic, and Saharan-Indian floristic zones. The more central portions of the empire contained an enormous range of flora, including desert, steppe, and semi-desert vegetation; sub-tropical savannah; *Pistacia* and *Quercus* woodlands; scrublands dominated by almond and juniper; conifer forests; and sub-alpine and alpine vegetation (Breckle 2007). Following the last glaciation the Zagros and Alburz mountains in Iran and the Hindu Kush/northern Afghanistan provided refuge for a large number of tree species, many of which later spread across Iran, Anatolia, and into Europe. Indications of ancient environments within the Achaemenid Empire are provided by both Achaemenid epigraphic and Greek literary sources as well as archeological data.

One of the most well-known Achaemenid sources is Darius' exposition (DSf) of the materials used in the construction of his palace at Susa (Lecoq

1997: pp. 234–237). According to Darius, the cedar used in the palace came from the mountains of Lebanon; the sissoo wood (OP *yakā*; see Gershevitch 1957) from Gandhara (northwest Pakistan) and Kerman (southeastern Iran); and the ebony (*Dalbergia melanoxylon*) from Egypt. In ancient usage, however, it is often the case that the geographical descriptor attached to a commodity is the supplier of the material rather than the actual land in which it grew or was mined. This is true in the case of Darius' ebony, the actual provenance of which was probably somewhere in sub-Saharan Africa (the current range extends from Senegal in the west to Eritrea/northern Ethiopia in the east and to Angola and the Transvaal in the south; see Hepper 1996: p. 6).

Minerals used in the palace at Susa included gold from Lydia, probably the alluvial gold of the Pactolus river (Muhly 1983: p. 7) or the slopes of nearby Mt. Tmolus (Forbes 1939: p. 244), and Bactria (northern Afghanistan and southern Uzbekistan); lapis lazuli and carnelian (?) from Sogdia; and turquoise from Chorasmia. It is doubtful whether the lapis lazuli mines at Sar-e Sang in the Hindu Kush mountains of northern Afghanistan, the major source in all periods of ancient Near Eastern history, lay within the bounds of Sogdia, which centered on the Ferghana Valley further north in what today is Uzbekistan. Herzfeld reckoned the mines were located in eastern Bactria (Herzfeld 1968: p. 323). It is perfectly reasonable to suppose, however, that the Sogdians had access to lapis lazuli from Sar-e Sang, though not that they necessarily controlled its extraction as has sometimes been assumed (La Vaissière 2004: p. 22). It is also questionable whether high-quality carnelian was available anywhere in Sogdia and more likely that if carnelian is indeed the correct translation of the term in question (OP *sinkabru*, El. *sinkabruš*, Akk. *Šingabrū*), it came from Gujarat (La Vaissière 2004: p. 21). Herzfeld suggested that carnelian was not meant here at all. Rather, he drew a parallel between the ancient term and *cinnabar* and suggested that this was “used for making the colours of the enamelled bricks of Susa” (Herzfeld 1968: p. 323, no. 3). As Pliny noted (*Nat. Hist.* 29.8), cinnabar (Gr. κιννάβαρι) or mercuric sulfate (HgS), was often confused in antiquity with *minium*, or lead oxide (Pb_3O_4), which was indeed a source of red pigment (Theophrastus, *De Lapidibus* 8.60; Eichholz 1965: p. 128). Although in the Roman and medieval periods lead oxide came mainly from Spain (Porter and Vesel 1993: p. 147; cf. Strabo, *Geog.* 12.2.10, where the Iberian is said to rival the Cappadocian variety), another source must have been available to the Achaemenids, for analyses of glazed bricks in the Louvre, presumably originating in Darius' palace or one of the later royal Achaemenid buildings at the site (Boucharlat 2010: pp. 374–384), have shown the presence of lead oxide (Bouquillon et al. 2007: pp. 132–134). Interestingly, mercury was detected in some of the bricks in the so-called Šāhūr palace of Artaxerxes II at Susa and this implies a source of cinnabar from which mercury was obtained (Boucharlat 2010: p. 408).

The Chorasmian turquoise cited by Darius most probably came from the mines in the Kyzyl Kum, southeast of the Aral Sea and north of Zerafshan (Tosi 1974: pp. 149–150).

Turning to some of the Greek literary sources, Xenophon's *Anabasis* is replete with geographical and topographic information, including the names of rivers crossed and places visited, but when describing, for example, Cyrus the Younger's passage from Cilicia to Thapsacus on the Euphrates, it scarcely offers any description of the country traversed (Xenophon, *Anab.* 1.4.11). Upon reaching "Arabia," i.e. northern Mesopotamia (Donner 1986), more description is given. According to Xenophon, "In this region the ground was entirely a plain, level as the sea. It was covered with wormwood, and whatever other kinds of shrub or reed grew on it, were all odoriferous as perfumes. But there were no trees. There were wild animals, however, of various kinds; the most numerous were wild asses [onagers, *Equus hemionus*]; there were also many ostriches, as well as bustards and antelopes" (*Anab.* 1.5.1–2). Further south, as they approached Babylonia proper, "there was neither grass, nor any sort of tree, but the whole country was completely bare. The inhabitants, who quarried and fashioned millstones near the river [Euphrates], took them to Babylon, and sold them, and lived upon corn which they bought with the money" (*Anab.* 1.5.5). This extreme barrenness is a perfectly accurate description for the time of year in which Cyrus' passage into Babylonia occurred. This has been dated to the very end of August (Watson and Ainsworth 1883: p. 260), which, with respect to the ancient Mesopotamian agricultural calendar, was after the annual harvest in July/August (Potts 1997: Table III.1). Some scholars have been puzzled by the absence of any reference to pastoral nomads and their herds in this description (e.g. Donner 1986), but from the general floral, faunal, environmental, and agricultural point of view, the description accords well with the semi-arid nature of the steppic environment in this region during the late summer. In the fourteenth/fifteenth centuries, Turcoman nomads, such as the Aq-qoyunlu, wintered in precisely this area – the steppe between Mosul on the Tigris and Raqqah and Bireçik on the Euphrates, north as far as Diyarbakır – but summered further north over an area extending from the east of Erzurum to the west of Erzincan, and almost as far north as the Black Sea (Woods 1999: Map 2). It is likely, therefore, that when Cyrus the Younger passed through, any pastoral nomads that might have frequented the region in winter had long since moved north to more temperate areas in Anatolia.

Later Greek sources compiled in the wake of Alexander's conquest provide a snapshot of environments found in the different satrapies of the Achaemenid Empire, naming rivers, mountain ranges, and other notable physical features as well as resources. The lost but heavily cited *Geographika* of Eratosthenes (Roller 2010), the later compendium of Strabo (Biffi 2002), and the histories

of Alexander's campaigns (especially Arrian's *Anabasis*) are invaluable sources of material on the landscapes of the late Achaemenid Empire. Even some of the most arid regions, like Gedrosia, produced economically (and medicinally) important resources. The flora of Gedrosia was described in considerable detail by Theophrastus (Theophrastus, *Hist. Plant.* 4.4.12–13; cf. Arrian, *Anab.* 6.22.4–8; Strabo, *Geog.* 15.2.3; Pliny, *Nat. Hist.* 12.33) and included, in the interior, a myrrh-like aromatic (*bdellium*), triangular spurge (*Euphorbium antiquorum*), spikenard (sweet rush or ginger grass, *Cymbopogon schoenanthus*), asafoetida (*Scorodosma foetidum*), oleander (*Nerium odorum*), and the date palm (*Phoenix dactylifera*) as well as mangrove (*Avicennia marina*) along the coast (Eggermont 1975: pp. 120–125; cf. Bretzl 1903). Many of these species were found in Aria, Arachosia, and Parapamisadae as well (Eggermont 1975: p. 123). Such accounts, while valuable, obviously present only the smallest fraction of the economically valuable flora, let alone the complete flora of these areas. There were many more species of great utility that went unmentioned, as a glance at the literature on the economic botany of, for example, eastern Iran clearly shows (Aitchison 1890). To mention just one wood that was highly prized for woodworking, Pakistani rosewood (*Dalbergia sissoo*), known widely as sissoo throughout the region, went unmentioned, although it was common throughout the Indo-Iranian borderlands (Tengberg and Potts 1999).

Finally, archeological and in particular archeobotanical and paleoenvironmental studies at individual sites, along with regional surveys, have contributed to our knowledge of the climate and environment of the Achaemenid Empire. Studies around Gordion, in the ancient satrapy of Phrygia, for example, point to the existence of extensive non-deciduous forests, containing pine (*Pinus sylvestris*), cedar (*Cedrus libani*), and yew (*Taxus baccata*), around the site about 2500 years ago (Erinç 1978: p. 97). Deforestation of these forests only began later, accelerating during the Roman period (Brice 1978).

It is clear from analyses of cores taken from Lakes Zeribar and Mirabad in northwestern Iran that there are few signs of climatic fluctuation in the region after about 3500 BCE (van Zeist 1967: pp. 310–311; Bottema 1986: p. 259; Jones 2013). Moreover, those indications of climatic shifts that do appear at Lake Mirabad all postdate the Achaemenid period (Griffiths et al. 2001: p. 761).

However, all across the Achaemenid Empire human intervention and modification of the landscape also must have played a role. This would have included the alteration of ecosystems through agricultural intensification, including olive cultivation in Fars (Jones et al. 2015; Djamali et al. 2016) and the expansion of irrigation systems involving the building of dams, qanats, and canals. There is a widespread if often unacknowledged belief that agricultural intensification was actively pursued by the Achaemenids, e.g. in the Deh Luran

region, which lay astride the Royal Road between Susa and Babylon (Wright and Neely 2010: Fig. 6.6), but water management features are notoriously difficult to date, particularly when local masonry styles are not easily attributed to a particular period and commemorative or foundation inscriptions are absent (Boucharlat 2001: p. 178). Thus, the attribution of hydraulic features, attested archeologically, to the Achaemenid period is difficult. Moreover, even when hydraulic works mentioned in cuneiform or literary sources, or discovered in excavation, can be dated to the Achaemenid period, it is often unclear whether they resulted from centrally mandated imperial or locally driven investment, or indeed from a combination of the two. Evidence of local investment spurred by central governmental incentives can be found in Polybius' well-known discussion of qanats in Media. According to Polybius (*History* 10.28), "in this tract of country there is no water (*anhydria*) appearing on the surface, though there are many subterranean channels (*hyponomoi*) which have well-shafts (*phreatiai*) sunk to them, at spots in the desert unknown to persons unacquainted with the district. A true account of these channels has been preserved among the natives to the effect that, during the Persian ascendancy, they granted the enjoyment of the profits to the inhabitants of some of the waterless districts for five generations, on the condition of their bringing fresh water in; and that, there being many large streams flowing down Mount Taurus [Alburz], these people at infinite toil and expense constructed these underground channels through a long tract of country in such a way that the very people who now use the water are ignorant of the sources from which the channels are originally supplied."

This clearly indicates that the Achaemenid government actively provided incentives for local investment in qanat construction and maintenance in Media. Less certain is whether or not the same policy operated elsewhere in the empire. Many scholars have inferred from Polybius' statement that under the Achaemenids, "qanat technology spread well beyond the confines of the Iranian Plateau" and, as a result of the policy of land grants, "thousands of new settlements were established and others expanded" as "qanats were constructed from Mesopotamia to the shores of the Mediterranean as well as southward into parts of Egypt and Arabia" (English 1998: p. 189; cf. Goblot 1979: pp. 70–71; Rahimi-Laridjani 1988: pp. 445–447; Lightfoot 2000: p. 218). As Briant has stressed, however, it is important to remember that Polybius explicitly attributed the investment in qanats to private enterprise, rewarded with long-term land tenure (over five generations), not state investment (Briant 2001: p. 18). The recently excavated qanat system at 'Ayn Manāwīr in the Kharga Oasis (Egypt), constructed during the fifth century BCE according to Demotic ostraca dated in the reigns of Artaxerxes I and Darius II, may reflect "a decision issued from the court at Memphis" and "could have been the decision of the Persian central power under the control

of the Satrap of Egypt and his administration” (Wuttmann et al. 2000: pp. 3–5), but this is far from proven. A decentralized approach to water capture and management, even if disseminated from the top down, may have been left to local administrators to implement (Cruz-Urbe 2003: p. 543).

Even in Babylonia, a satrapy of central importance, both fiscally and agriculturally, to the Achaemenid crown, “the extent to which the crown itself was responsible for the improvements in the [irrigation] system rather than merely benefiting from them by right of conquest” is unclear (Adams 1981: p. 187). Although A.L. Oppenheim believed that Achaemenid Babylonia was characterized by “new installations, new techniques, [and] better utilization of the available water” (Oppenheim 1985: p. 578), and the Great King owned many canals (Dandamayev 1992: p. 13), it is not always clear whether the contributions of the crown to canal construction were greater than those of private landowners (Joannès 2004: pp. 214–216). Indeed, in comparison with the number of references to canal construction and maintenance in the Neo-Babylonian period credited to individual kings (Cole and Gasche 1999: pp. 102–105), the paucity of references in the Achaemenid period could be construed as a sign that the Achaemenids were content to use the infrastructure they had inherited in Babylonia without investing much in the upkeep or expansion of the canal system themselves, notwithstanding the fact that the agricultural yields there continued to be impressive (Wiesehöfer 1999: p. 174). This, however, would be wrong. Like their predecessors, the Achaemenid administrators responsible for Babylonia attended to the upkeep and expansion of the irrigation network, but they were able to see that the great institutions in the land, principally the temples, bore the lion’s share of the costs. Thus, in one text concerning a rent farmer, dated to the second year of Darius I’s reign, reference is made to “digging on the main canals at the expense of the treasury of Eanna” (i.e. the large temple complex at Uruk). Another text (Dar. 9) from the reign of Darius attests to the involvement of the Shamash temple at Sippar in the digging and cleaning of canals that ran through its property, as well as the involvement of a consortium identified as “the chiefs of the chariots” (van Driel 1988: p. 129, citing TCL 13: 182). In van Driel’s opinion, these were major maintenance projects “supervised by the royal administration which shared out the burden among the great institutional and private landholders who in their turn had to make their financial, material, and human resources available” (van Driel 1988: p. 129). At the same time, as van Driel has noted, “Temples and owners of big estates were certainly capable of digging branch canals of lesser importance on their own” (van Driel 1988: p. 130). Finally, it is telling that the central administration in Achaemenid Babylonia leased entire canals, “from intake to tail,” to entrepreneurs, a handy source of income, and that these private persons aggressively established date plantations on land adjacent to canals and rivers (van Driel 1988: p. 145).

This anthropogenic expansion of gardens, previously much less visible in the cuneiform record, undoubtedly altered the micro-environment of the region, just as afforestation has in many parts of the world (e.g. Abu Dhabi) in our own time.

CHAPTER 2

Demoscopy and Demography

Josef Wiesehöfer

Object of Research and Method

The object of demographic history is the description and explanation of the size, structure, and development of (ancient) populations in their relationship to living space. It should be noted that there are natural and uncontrollable determinants of population development as well as controllable ones, and that the interwoven determinants can simultaneously be cause and effect of such development. So far, ancient demographic history has particularly been interested in ancient views of population development, questions of the size of ancient populations (at a particular point in time or over a particular period of time), the age and gender structures of ancient societies, and particular determinants of population development such as life expectancy, marriage practices, reproduction, and fertility, and population movements. Answers to all questions concerned are normally based on the one hand on ancient source material, which, while qualitatively and/or quantitatively susceptible to evaluation, is not unproblematic (see below), and on the other hand on consideration of modern model life tables (however, available only for quite recent populations), the creation of more reliable high-mortality models, and comparative ethnological material. In doing so, the demographic history of ancient societies has made use of the discoveries of adjacent disciplines such as the historical demography of other epochs, archeology, anthropology,

sociobiology, cultural geography, and sub-disciplines of ancient history such as social, nutritional, economic, and medical history.

It has long been known that population size and population development have always had a significant influence on political, economic, cultural, and mental performances and developments:

the distribution of people between town and country was instrumental in the creation of collective identity, and may reflect the scale of division of labor and commerce; human mobility mediated information flows and culture change; mortality and morbidity were principal determinants of wellbeing, and determined fertility (and thus gender relations), investment in human capital, and economic productivity, and more generally shaped people's hopes and fears. The same is true of marriage customs and household structure. Classical civilization was the product of a thoroughly alien environment of frequent pregnancy and sudden death. Along with technological progress and scientific discovery, it was demographic change that separated the modern world from the more distant past. Archaic patterns of marriage, reproduction, and death seemed as natural and immutable then as they are exotic to us, and we cannot hope to approach ancient history without a solid understanding of what these conditions were and how they permeated life. This is the true challenge of demography. (Scheidel 2009: p. 134)

The Malthusian Law of Population in the meantime has been seen as flawed by its ignorance of factors such as technology, poverty, endemic disease, wars, and natural disasters, and modern theories have got as their point of departure the concept of demographic equilibrium, i.e. the idea that a population adapts itself to its biological, economic, and social-structural environment in such a way that mortality and fertility balance each other out over an extended period of time and at a level that depends on the population's resources, technology, and standards of living (Scheidel 2007: 50 ff). Therefore, "significant demographic change is mainly (to be) attributed to exogenous factors: climate, technology and endemic disease patterns, and in the short run to famines, particularly virulent epidemics and political factors like war" (Jursa 2010: p. 37).

The Sources and Their Relevance

The evaluation of the various types of source materials for demographic history faces fundamental problems that are also unique to the field of ancient history on the whole: gaps and coincidences in the body of tradition firstly pose the question of how representative available materials are. It must also be noted that the sources available to us were only rarely created for the primary purpose of demographic statistics, but far more often primarily for fiscal, judicial, military, and administrative purposes and to facilitate economic organization.

Table 2.1 Modern Estimates of the Population of the Achaemenid empire (McEvedy and Jones 1978: p. 125 (low estimates) and Aperghis 2004: pp. 56–58 (high estimates; cf. also Aperghis 2001: pp. 73–77). Scheidel 2007: p. 63 gives 20 000 000–25 000 000 inhabitants).

Area	Region population
<i>Low estimates</i>	
Egypt	c. 3 500 000
Near East (without Arabia)	c. 12 000 000
Central Asia and India	c. 1 500 000
Whole empire	c. 17 000 000
<i>High estimates</i>	
Mesopotamia	c. 5–6 000 000
Bactria/Sogdiana	c. 2 000 000
Margiana	c. 500 000
Central and eastern Persis	c. 500 000
Susiana and western Persis	c. 1 000 000
Northern Syria	c. 500 000
Cilicia	c. 2 000 000
Western and southern Asia Minor	c. 5 000 000
Syria/Palestine	c. 1 500 000–2 000 000
Egypt	c. 5–6 000 000
Eastern regions of the empire	At least c. 7 000 000
Whole empire	c. 30–35 000 000

Information on the demographic parameters of the Achaemenid Empire is rudimentary at best. What we have comes from a variety of sources, and the numbers they provide us with are highly controversial. As far as the total population of the Achaemenid Empire is concerned, a presentation of two different demographic tables reveals the problems of such calculations (Table 2.1).

The surviving numerical material must be examined both for its reliability and for its possible topos-related nature. This is especially true for Greco-Roman literary sources, which are often enough internally contradictory, stereotypical, or accidental, as well as dependent upon the narrative intentions and the purpose of the author. For example, Herodotus' (3.89) accounts of tributes to the Achaemenid king and of the size of the Persian army and fleet during the so-called Persian Wars (490–479 BCE) imply a very large population of the empire. More detailed analysis, however, proves that the Halicarnassian's figures are unreliable. Both his list of *nomoi* and the figures he gives for the tribute are not dependent on Persian sources (cf. Jacobs 1994: pp. 93–97; Ruffing 2009). His description of the size of the army is based on both Homer's epics and Hecataeus' ethnographical work, and the figures he lists for the number of soldiers and ships are based on patterns that express

nothing but relations of magnitude (Bichler 2000: pp. 323–327). Finally, by exaggerating the size of the Persian army throughout Greek history, authors such as Herodotus, Xenophon, and the historians of Alexander the Great magnify the Greeks' military achievements to make them seem exceptionally glorious. The authors of the fourth century BCE in particular succeeded in making the Persian opponent appear extremely daunting, but only because of the sheer size of its army (whose members had allegedly been coerced by the Great King to serve and fight) and not because of any bravery on the part of the soldiers or the tactical skills of their commanders.

Apart from those foreign texts, research on the demographic parameters of the Persian Empire has so far concentrated on two kinds of evidence: archeological surveys of settlement patterns (especially in the central Mesopotamian floodplain, but also in Judaea, etc.) and epigraphic documentation (mostly also from Babylonian archives). Only recently, and for reasons of reconstructing the economic history of Neo-Babylonian and Achaemenid Mesopotamia, scholars have intensively dealt with those two kinds of source material. It would be helpful to have those surveys and those assessments of the textual documentation also for other parts of the Persian Empire, e.g. for Egypt (where the evidence should be similarly sufficient to provide some information on demographic parameters. But see Chapter 20 Egypt and Wasmuth 2017. For a demographic study on ancient Egypt on the whole, see Kraus 2004).

Archeological surveys from the beginning of the 1980s, which, however, focused on the whole period from the third millennium to Seleucid-Parthian times and, as already noted, were concentrated on the central alluvium (Adams 1981), were able to detect (on the basis of a calculation of settlement and population density) a significant population increase not later than the seventh century BCE. Thus, the values for the gross occupied site area rose from the Middle Babylonian (1150–700 BCE) to the Neo-Babylonian and Achaemenid periods (until 300 BCE) from 616 ha to 1769 ha, the average site size from 4.6 ha to 6.88 ha. From the very obvious increase in large sites (settlements of 10-plus ha may be described as urban communities) from 36% to 51% of the area in this period, it has been concluded that “we are dealing with fairly abrupt, probably state-directed, policies of settlement formation in the case of the urban communities” (Adams 1981: p. 178). Table 2.2 underlines this development (for the original table, see Jursa 2010: p. 40).

As far as the irrigation systems are concerned, a marked shift, starting in the Neo-Babylonian period, has been postulated from locally regulated canal systems toward a centrally planned and maintained irrigation system with large canals and a markedly enlarged acreage (which, however, can only be recognized in reality for the Sasanian period). This hypothesis is said to be supported by evidence that points to high fees levied for the use of irrigation “water from state-owned canals” in the Achaemenid-controlled alluvium of

Table 2.2 Settlement development 2100 BCE – CE 200.

Site size	• Ur III-Isin-Larsa	• Old Babylonian	• Kassite	• Middle Babylonian	• Neo-Babylonian-Achaemenid	• Seleucid-Parthian
200.1+ ha	2	1	—	—	—	2
40.1–200 ha	11	7	4	1	5	4
20.1–40 ha	10	7	2	3	6	15
10.1–20 ha	16	10	7	2	19	34
4.1–10 ha	57	45	59	28	70	95
0.1–4 ha	143	108	165	100	157	265
(Total)	239 (2725)	178 (1791)	237 (1308)	134 (616)	257 (1769)	415 (2955)
Average site size (ha)	11.4	10.06	5.52	4.6	6.88	7.12

the fifth century BCE, and that in turn “seems to imply an awareness of possibilities of economic expansion that were tied to an ascending rate of state investment in the irrigation infrastructure” (Adams 1981: p. 246).

It has recently rightly been pointed out that each model of the Neo-Babylonian (and Achaemenid) economy (and population development) has to be based on those studies. At the same time, however, scholars have pinpointed the problems (partly already referred to by the author of the surveys himself) of the evidence and the methods of investigation employed: the dating uncertainties (of the pottery involved), the non-consideration of the area where the majority of the most important Neo-Babylonian urban centers were located (along the new western course of the Euphrates), and of the territories (in western and southeastern Babylonia) that represented the centers of the Chaldean tribes. The fivefold increase in the population between 700 BCE and 300 BCE postulated in the 1981 surveys is now regarded as too high, although it remains unclear by how much. Nevertheless, the following trends may be stated for the Neo-Babylonian and Achaemenid periods: “demographic growth, an increasing degree of urbanisation, agrarian expansion and the role of the state” (Jursa 2010: p. 42). These are trends that, for the sixth century BCE, find their expression also in a significant increase in economic activity (which in turn is suggested by the extent of the written documentation) and the great Neo-Babylonian building projects (Jursa 2010: p. 42).

As for late Persian period Judah, both excavations and surveys (of settlements and administrative-oriented sites) have proven that this political entity must have been “a rural province with no more than half the number of settlements as the late Iron Age” (Lipschits and Tal 2007: p. 47. See also Lipschits 2003, 2005, *passim*). Conversely, no change can be observed between late Persian and early Hellenistic Yehud as far as settlement patterns, territory, and the organization of the administrative system are concerned.

Persian imperialism did not lead to the development of new megatowns (like Babylon) but rather to the adjustment to Persian needs of existing royal centers such as Babylon, Susa, Sardis, and Ecbatana. Still, the Achaemenids contributed significantly to the process of urbanization in the Ancient Near East by promoting satrapal capitals as regional centers (thereby following an Assyrian program) and by investing revenues in constructing new royal cities in their home province of Fars (Persepolis, Pasargadae, Matezzish). Since the “itinerant ruler” was a particular feature of Achaemenid kingship (Briant 1988; Tuplin 1998), Persian residences (note the kings’ self-portrayal as master builders, hunters, and gardeners) were marked by special architectural and landscaped constituents (palaces, fortifications, administrative buildings – open spaces for tents, gardens, and game parks [*paradeisoi*]).

Babylonian epigraphic documentation from Neo-Babylonian and Persian times (mostly from temple archives) is unable to match the value that the

several hundred census returns on papyrus from Roman Egypt (Bagnall and Frier 1994) of the first three centuries CE have for Greco-Roman demography (e.g. as a testimony for a supposed mean life expectancy at birth of between 20 and 30 years). However, it gives information on the active life span of craftsmen working for the temple (25 years), their cooperation with their fathers (for three to five years), and thus their age at marriage (on average below 19 years; in Roman Egypt: just above 25), thereby (roughly) corresponding with the Life Table Model West, Level 2 (Coale and Demeny 1983). Babylonian ration lists, mostly from the fourth century BCE, suggest a mean number of 3.4 adolescent children for average males (which would lead to a total of 7.73 births according to the Life Table quoted above). Other results of demographic research on Neo-Babylonian and Achaemenid Babylonia are: life expectancy at birth for men – roughly 20.5 years (at the age of 20: until the age of 48; Roman Egypt: 25 and 50.7 respectively); age at marriage for females: about 14–15 years (for the demographic parameters of the Babylonian epigraphic evidence see Jursa 2010: pp. 37–39).

At first sight, the Persepolis Fortification Archive (for the Archive see Briant et al. 2008; Henkelman 2008: pp. 65–179) seems to be a quite meaningful demographic corpus. However, recent scholarly contributions have clearly proven the pitfalls and biases of the material in that respect (Henkelman 2008: pp. 79–85). For example, attempts to estimate the population of Fars or even only the number of workers involved in the “Persepolis economy” are highly problematic. First, we see only a part of the administrative-economic system, and we have no idea how large this part really was. Second, the numbers of the workers mentioned in the Elamite “Fortification Tablets” from Persepolis that have been published so far are also problematic; not even in combination with later historians’ praise of the fertility and population density of Persis do they enable us to estimate the size of the population of the core province of the empire. The groups of workers mentioned in the texts are not separate units; thus, certain (anonymous) workers might appear in different groups on different occasions. The manual workers and craftsmen employed there were actually members of a special labor force, recruited from all over the empire to serve the king in Fars. The proportion of men to women indicates no more than that some of these workers must have lived in family groups (against Aperghis’ view of an underfeeding of male workers (Aperghis 2000; see Tuplin 2008: 319f). The ratio of different generations does not match other ancient demographic patterns, and an assessment of living and work spaces minimizes the numerical data’s meaningfulness. But by looking at a special case (special rations for mothers) (Brosius 1996: pp. 171–178) and at Greek testimonies of the royal policy of reproduction (Hdt. 1.135f; Str. 15.3.17), it becomes obvious that Persian rulers were interested in the greatest possible number of potential soldiers, officials, and workers (Briant 2002: 277ff).

What we urgently need are reconstructions of human-climate-ecosystem interactions in different parts of the empire to be able to ask questions the answers to which might also lead to demographic insights.¹ For Fars, for example, those questions might be: What was the environmental context in which (i) the mobile agro-pastoralism and nomadism gave way to sedentary lifestyle, and (ii) the first highland urban centers established in the continental Middle East? How did human societies react to climate change and drought events? Were people aware of human-caused ecosystem change? How did human societies react to ecosystem change caused by anthropogenic disturbance? What was the spatial pattern of agro-pastoral practices and social organization within the capital area of the empire? What was the impact of major historical events on the dominant lifestyle during the historical period?

One of the most important branches of (ancient) demography is the study of population movements (Hahn 2012; Schunka and Olshausen 2010). However, the paucity of quantifiable evidence and the biases of some of the sources make demographic approaches and attempts of that kind again a difficult and dangerous undertaking. As for the Persian Empire, both the Greek and the indigenous evidence assign much relevance to Achaemenid “forced” or “involuntary migration” as a demographic factor. However, most of the classical reports on cases of deportations or population transfers have to be evaluated against their respective historical background (e.g. the stories of the alleged massacre of the Branchidae by Alexander III or the deportations following the falls of Miletus [494 BCE] and Eretria [490 BCE]), the literary or political traditions they are part of, and their authors’ intentions (cf. Olshausen 1997; Kehne 2009). Even the more reliable testimonies of the indigenous administrative evidence (cf. the famous case of the Caro-Egyptians in Borsippa [Waerzeggers 2006]; cf. also the *hatru* collectives in Babylonia, organized in terms of their duties, customers, or place of origin, and the abovementioned *kurtash* of the Persepolis texts) call for sober historical explanations and an evaluation in light of a long Ancient Near Eastern tradition of forced migration.² Besides, scholars have underlined that deportations should be distinguished from other, somewhat similar sanctions that may occur together with them, for example expropriation and massacre, exile of individuals and their families or adherents, enslavement or military conscription of conquered peoples, and forced sedentarization of nomads. However, there is little to suggest that further studies will be able to provide forced migration statistics (including the numbers of people from Greece and other countries who sought refuge with the Great King and his satraps).

The same holds true for an evaluation of transfers of army personnel, immigration, voluntary movements over long or short distances (settlers, colonists, etc.), seasonal migration, or migration from urban centers to rural areas or

vice versa. The relative peace and safety on Persian-controlled routes and waterways did surely facilitate the voluntary movements of people eager to change places (traders, settlers, etc.). The royal distribution of land and property to Iranian and non-Iranian officials and officers in newly acquired territories and the service of Achaemenid garrison troops in places far away from their homes also influenced demographic conditions. After all, both of these migratory measures led to the development of an Iranian cultural “diaspora,” especially in Hellenistic and Roman Asia Minor (for Achaemenid Anatolia and its *Nachleben* see Dusinberre 2013).

NOTES

- 1 A proposed Franco-German project aims at reconstructing human-climate-ecosystem interactions in the Persepolis Basin (southwest Iran) during the Holocene by using different archive types: lake sediment cores, peat cores, soils, and soil sediments, as well as written sources (especially for the time interval of ca. 3000–1500 BP) and archeological plant and animal remains complemented by available geochemical records. Apart from its main objectives (an evaluation of the past and present water resources in the Persepolis Basin and their availability to past human societies, and an assessment of human impacts on natural ecosystems; the establishment of human-independent, high-resolution, hydroclimatic records using biological proxies correlated with available geochemical records), the final goal of the project is to compare and cross-check the acquired palaeo-environmental datasets with already available knowledge from the Persepolis Basin to give a synthetic account of the climate–human interactions during the Holocene.
- 2 The Kiel dissertation by C. Matarese (Matarese, in press) (see Chapter 61 Migration and Deportation) will try to remedy the current lack of a comprehensive study of Achaemenid deportations.

CHAPTER 3

Peoples and Languages

Jan Tavernier

Introduction: The Territory of the Achaemenid Empire

At its largest extent the Achaemenid Empire comprised a gigantic territory, extending from Thrace and northern Greece in the west to India in the east, and from Egypt in the south to Afghanistan and Central Asia in the north. This huge territory was in the first place brought together by the founder of the empire, Cyrus II (c. 559–529 BCE), who added Media (central Iran), Asia Minor, the eastern Iranian regions, Mesopotamia, and the Levant to his small kingdom of Anshan. Despite his short reign, Cyrus' son and successor, Cambyses II (529–522 BCE), was able to conquer Egypt, and his successor, Darius I (521–486 BCE), took some areas in the north (Scythia), Thrace, and the lower Indus valley (Figure 3.1).

The Achaemenids were proud of the geographical hugeness of their realm, as can be seen in the royal inscriptions DPh and DH (Darius I):

This (is) the kingdom which I hold, from the Saka who are beyond Sogdiana, from there as far as Kush, from the Indus as far as Sardis, which Ahuramazda, the greatest among gods, bestowed upon me.

This consciousness is also present in the words of Cyrus the Younger, transmitted by Xenophon (*Anab.* 1.7.6). By these words Cyrus identifies the Achaemenid Empire with the inhabited world:

A Companion to the Achaemenid Persian Empire, Volume I, First Edition.

Edited by Bruno Jacobs and Robert Rollinger.

Figure 3.1 Map of the Achaemenid Empire. Source: Reproduced by permission of Jan Tavernier.

My father's realm extends toward the south to a region where men cannot dwell by reason of the heat, and to the north to a region where they cannot dwell by reason of the cold.

Finally, the hugeness of the Achaemenid Empire also impressed some Greek authors, such as Xenophon (*Cyrop.* 1.1.3), who writes that

Cyrus, a Persian, acquired very many people, very many cities and very many nations.

The Internal Ethnic Diversity of the Achaemenid Empire

In the Achaemenid Royal Ideology

The internal diversity too of the realm was frequently referred to in the Achaemenid inscriptions. It is expressed literally (in combination with the geographical extent) in DPg, a Babylonian inscription from Persepolis:

A great (god is) Ahuramazda, who ..., and bestowed on Darius the king king-ship over this wide earth, in which there are many lands: Persia, Media and the other lands of other tongues, of mountains and plains, from this side of the sea to that side of the sea, from this side of the desert to that side of the desert.

Also in other inscriptions, various expressions illustrate the consciousness of the Achaemenid kings with regard to the diversity and extent of their kingdom:

- 1) *Paruzana*- “containing many (kinds) of men”: This lexeme is attested in the royal title, in the formula *xšāyaθiya dahyunām paruzanānām* “king of countries containing many kinds of men” (DE 15–16, XE 15–16, A¹Pa 11–12). It is two times written *paruvzanānām* (XPb 15–16, XPd 11) and five times, in texts from Xerxes, it is split in two: *paruv zanānām* (XPa 8, XPc 7, XPf 11, XPh 9, XV 12).
- 2) *Vispazana*- “containing all (kinds) of men”: Also attested in the same royal formula *xšāyaθiya dahyunām vispazanānām* “king of countries containing all kinds of men” (DNa 10–11, DSe 9, DZc 5). It seems that *paruzana*- gradually replaced *vispazana*- as expression *par excellence* for the ethnic diversity of the Achaemenid Empire.
- 3) *Visadabhyu*- “of all countries”: name of a gate in Persepolis (XPa 12).

These words were firmly established in the Achaemenid royal ideology and were that specific that the Elamite (and once a Babylonian) versions simply transcribed the Old Persian words into their own languages:

- 1) *Paruzana*- (Tavernier 2007a: p. 35 no. 1.4.2.3): El. bar-ru-za-na-° and ba-ru-za-na-°. Note that the Elamites also used a genuine Elamite word to translate this expression: *iršekki* (XPc 11–12).
- 2) *Visadana*- (Tavernier 2007a: p. 78 no. 2.4.2.1): El. mi-iš-šá-da-na-°. Old Persian variant of the “Median” form *vispazana*-.
- 3) *Vispadana*- (Tavernier 2007a: p. 78 no. 2.4.2.2): El. mi-iš-ba-da-na-°. Old Persian–Median *Mischform*.
- 4) *Vispazana*- (Tavernier 2007a: p. 78 no. 1.4.2.5): Attested in the Elamite version of DPa (mi-iš-ba-za-na), although it does not appear in the original Old Persian version.
- 5) *Visadabhyu*- (Tavernier 2007a: p. 37 no. 1.4.8.4): Attested in the Elamite version of XPa (mi-iš-šá-da-a-hu-iš).
- 6) *Visadabhyu*- (Tavernier 2007a: p. 80 no. 2.4.8.1): Attested in the Babylonian version of XPa (ú-’-is-pi-da-a-’-i).

The Babylonians used more of their own lexicon to translate the Old Persian expressions: *Paruzana*- became *ša naphar lišānu* “of all tongues” (XPa 7, XPc 10, XPd 11, XPh 6; XV 12) or *ša naphar lišānata* (DE 15–16). *Vispazana*- was translated by the same expression in DNa 5 and DSe 6.

Interestingly, *vispazana*- and its variants are also attested in documentary texts from Persepolis (Fortification and Treasury Texts) but in a much more mundane way than in the inscriptions. The adjective applies to horses (NN 0726), fowls (NN 574, 790, 1664, 1674; PF 1747–1749), and cereals (PF 1223). In PT 79 the context is less clear and the adjective could refer to laborers or to a part of a building.

Furthermore, the multiethnic character of the Achaemenid Empire also appears on two other levels in the Achaemenid royal inscriptions (Briant 1996: pp. 184–186): the satrapy lists and the “Foundation Chart” of Susa.

Five inscriptions (DB, DPe, DSe, DNa, XPh) have a list of lands subject to the Achaemenid king. The lands mentioned are the following:

DB	DPe	DSe	DNa	XPh
Persia	Elam	Media	Media	Media
Elam	Media	Elam	Elam	Elam
Babylonia	Babylonia	Parthia	Parthia	Arachosia
Assyria	Arabia	Aria	Aria	Armenia
Arabia	Assyria	Bactria	Bactria	Drangiana
Egypt	Egypt	Sogdiana	Sogdiana	Parthia
Sea-Land	Armenia	Chorasmia	Chorasmia	Aria
Lydia	Cappadocia	Drangiana	Drangiana	Bactria
Ionia	Lydia	Arachosia	Arachosia	Sogdiana
Media	Inland Ionians	Sattagydia	Sattagydia	Chorasmia
Armenia	Ionians by the sea	Maka	Gandhara	Babylonia
Cappadocia	Lands across the sea	Gandhara	India	Assyria
Parthia	Sagartia	India	<i>hauma-drinking</i> Saca	Sattagydia
Drangiana	Parthia	<i>hauma-drinking</i> Saca	Pointed Hat Saca	Lydia
Aria	Drangiana	Pointed Hat Saca	Babylonia	Egypt
Chorasmia	Aria	Babylonia	Assyria	Ionians by the sea
Bactria	Bactria	Assyria	Arabia	Ionians across the sea
Sogdiana	Sogdiana	Arabia	Egypt	Makians
Gandhara	Chorasmia	Egypt	Armenia	Arabia
Saca	Sattagydia	Armenia	Cappadocia	Gandhara
Sattagydia	Arachosia	Cappadocia	Lydia	India
Arachosia	India	Lydia	Ionia	Cappadocia
Maka	Gandhara	Ionians by the sea	Saca across the sea	Dahians
	Saca	Saca across the sea	Skudrians	<i>hauma-drinking</i> Saca
	Maka	Skudrians	<i>petasos-wearing</i> Ionians	Pointed Hat Saca
		Ionians across the sea	Libyans	Skudrians
		Caria	Nubians	Akaufaciyaans
			Maka	Libyans
			Carians	Carians
				Nubia
Total: 23	25	27	29	30

The above lists clearly illustrate the multiethnicity of the Achaemenid Empire.

Next to these lists of subject lands, there is the foundation chart of Susa (DSf). This text is a record of the building of a palace in the royal capital Susa. Darius mentions various regions from where the building material came and several people who supplied artisans engaged in the processing of these materials.

Regions and materials:

Land/people	Resource	Land/people	Resource
Arachosia	Ivory	Ionia	Wall ornamentation
Bactria	Gold	Lebanon	Cedar wood
Carmania	<i>yakā</i> -timber	Lydia	Gold
Chorasmia	Turquois	Nubia	Ivory
Egypt	Silver	India	Ivory
Egypt	Ebony	Sogdiana	Lapis lazuli
Elam (Abiraduš)	Stone columns	Sogdiana	Carnelian
Gandāra	<i>yakā</i> -timber		

Activities of peoples:

People	Activity
Assyrians	Transporting the cedar wood from Lebanon to Babylon
Babylonians	Molding sun-dried bricks
Carians	Transporting the cedar wood from Babylon to Susa
Egyptians	Goldsmiths
Egyptians	Woodworking
Egyptians	Wall adorning
Ionians	Transporting the cedar wood from Babylon to Susa
Ionians	Stone-cutting
Lydians	Stone-cutting
Lydians	Woodworking
Medes	Goldsmiths
Medes	Wall adorning

DSf is complemented by two other documents, equally recording the building of the palace in Susa. DSz is a much damaged copy of DSf. The other inscription, DSaa, exclusively recorded in Babylonian, does not connect specific materials with countries. After enumerating the various materials used for the palace (11–17), it simply states:

These are the lands that have brought the materials for the decoration of this palace: Persia, Media, Elam, Babylonia, Assyria, Arabia, Egypt, the Sea Lands, Lydia, Ionia, Armenia, Cappadocia, Parthia, Drangiana, Aria, Chorasmia, Bactria, Sogdiana, Gandāra, Cimmeria, Sattagydia, Arachosia, Maka (Qadê).

Clearly, these building inscriptions fit into the royal ideology concerning the *vispazana*-ness of the empire. Thanks to the unity and collaboration of all lands, guided by the master hand of the king himself, this magnificent palace has been built. The inscriptions stress the unity as well as the diversity of the Achaemenid Empire. Conspicuously, but not surprisingly, nearly all building activities are realized by two lands/peoples: stone-cutting is the job of the Ionians and Lydians, whereas woodworking is taken care of by Egyptians and Lydians, etc. This is in contrast to the Persepolis Fortification Archive (cf. *infra*), where there are but few instances of two ethnonyms appearing together in a single text (Henkelman and Stolper 2009: pp. 278–279). This underlines the ideological character of the inscriptions, which stress the solidarity and the eagerness, shared by all people governed by the Achaemenid king, to collaborate in order to realize the king's great projects.

Finally, the Achaemenid iconography also gives us some information on the royal consciousness concerning the multitude of peoples living in the empire. Throne bearers are depicted in Persepolis and Naqš-e Rostam. They are neatly distinguished with regard to their external appearance and are accompanied by captions describing them. Note that here the peoples' names are used rather than the lands' names: Persian, Median, Elamite, Parthian, Arian, Bactrian, Sogdian, Chorasmian, Drangianian, Arachosian, Sattagyidian, Gandharian, Indian, *hauma*-drinking Saca, Pointed Hat Saca, Babylonian, Assyrian, Arab, Egyptian, Armenian, Cappadocian, Lydian, Ionian, Saca across the sea, Thracian, *petasos*-wearing Ionian, Libyan, Nubian, Macian, Carian.

A statue of Darius (DSab), but sculpted in Egypt, depicts 24 persons, each belonging to a different people or land: Persia, Media, Elam, Aria, Parthia, Bactria, Sogdiana, Arachosia, Drangiana, Sattagydia, Chorasmia, Saca of Marsh and Saca of Plain, Babylonia, Armenia, Lydia, Cappadocia, Skudra, Assyria, Hagar (Arabia), Egypt, Libya, Nubia, Maka, India.

The Persepolis reliefs also show representatives of countries bringing their tribute: Medes, Elamites, Armenians, Arians, Babylonians, Lydians, Arachosians, Assyrians, Cappadocians, Egyptians, Saca (three types), Ionians, Bactrians, Gandharians, Parthians, Sagartians, Indians, Arabians, Drangians, Nubians.

If all this is taken together, one can make up a list of people mentioned by the Achaemenid kings as subject people. No less than 36 lands or people appear in these texts: Persia, Elam, Media, Sagartia, Akaufaciya, Parthia, Aria, Bactria, Sogdiana, Chorasmia, Drangiana, Arachosia, Sattagydia, Gandhara, India, *hauma*-drinking Saca, Pointed Hat Saca (these two peoples are plainly called Saca in the eldest inscriptions DB and DPe), Babylonia, Assyria, Arabia, Egypt, Libya, Nubia, Armenia, Cappadocia, Lydia, Skudra, Saca across the sea, Caria, inland Ionians, Ionians by the sea, Ionians across the sea, *petasos*-wearing Ionians (the Ionians are brought together under the header Ionia in DB), Lands across the sea, Dahia, Maka.

The rather large number of textual and iconographical royal sources listing the subject lands corroborates the importance for the Achaemenid kings to act in such a way. In other words, the enumerating of these lands is firmly established in the royal mind. In fact, it is one of the central axes of the royal Achaemenid ideology.

Peoples and Languages in Elamite, Babylonian, and Greek Texts

Elamite Texts

Large groups of ethnically defined workmen also appear in documentary texts from the Achaemenid period, especially in the Persepolis Fortification and Treasury Texts, where they are active in the Persepolis economy (cf. Henkelman and Stolper 2009 on the Skudrians; Rollinger and Henkelman 2009 on the Ionians; Tavernier 2015 on the Lycians; Uchitel 1989 and 1991 in general; Wasmuth 2009 on the Egyptians).

People attested in Persepolis, which must have been a really multicultural residential city, are Ākaufacians, Arabs, Arachosians, Arbelans, Areians, Armenians, Assyrians (Syrians), Babylonians, Bactrians, Cappadocians, Carians, Carmanians, Drangianians, Egyptians, Gandharians, Hattians (north Syrians), Hyrcanians, Indians, Ionians, Lycians, Lydians, Macians, Parikanians, Parthians, Sagartians, Skudrians, and Sogdians (Henkelman and Stolper 2009: pp. 300–306).

Remarkably, Persians, Medes, and Elamites are absent or nearly absent from the written documents, although their role in the Persepolis economy is beyond doubt (as already indicated by the Old Persian, Median, and Elamite names). This absence or near-absence may be explained by the fact that their ethnicity did apparently not matter for the Persepolis administrators (Henkelman and Stolper 2009: pp. 275–278).

Babylonian Texts

Babylonian texts dated to the Achaemenid period too sometimes mention foreign groups or individuals (Joannès 2009: pp. 224–227) and the fact that they are rather private texts than texts belonging to the public administration makes the context in which these groups appear different from the Persepolis context. An interesting dossier is that of the Caro-Egyptian (i.e. Carians coming from Egypt) soldiers stationed in Borsippa (Waerzeggers 2006; Heller 2010: pp. 341–344). This dossier illustrates one of the systems by which the Achaemenid state channeled the influx of foreign people in Babylonia: Borsippean citizens had to provide rations for the Caro-Egyptians. Other systems are (i) war prisoners that were sold into slavery or donated to a temple

and (ii) the military land-grant system, which functions according to the “land-for-service” principle and which is fairly well attested in the late fifth-century Murašû Archive. One text also illustrates this system for Jews (Waerzeggers 2006: p. 68). In addition, the Murašû Archive contains various names of so-called *ḫaṭrus*, which were named after an ethnic group: Arabs, Armenians, Carians, Cimmerians, Indians, Lydians, Phrygians, and Tyrians (Stolper 1985: pp. 72–79). An Egyptian community at Susa is well-attested in the Babylonian documentation (Joannès 1984).

From Babylonian texts can also be derived that Babylonian workers were active in the construction of a palace at Taokè (modern Borazjan, in the Bushehr region; Tolini 2008). The Elamite texts corroborate this, in naming groups of Egyptians, Skudrians, Cappadocians, and Lydians that were directed to the same place (Henkelman and Stolper 2009: pp. 279–280).

It should be kept in mind, however, that the Achaemenid Empire was not unique in using workforces not belonging to the same ethnicity of the ruling class for its own purposes. The Neo-Assyrian Empire is notoriously famous for its deportations of workmen from conquered areas to Assyria proper. In the same way the Neo-Babylonian Empire did precisely the same (just to mention the Babylonian Captivity) and at the royal court many non-Babylonian people are attested (Heller 2010: p. 336; Jursa 2010: pp. 72–73). The difference between the earlier empires and the Achaemenid Empire, however, is that in the latter the ethnically-defined groups play a role in the royal ideology whereas in Mesopotamia they are kept away from this ideology.

Greek Texts

The many Greek classical sources informing us on the history of the Achaemenid Empire mention numerous people, but the most famous passage must be the one in which Herodotus lists the 20 provinces installed by Darius I (*Hist.*, III 90–97; cf. Jacobs 2003; Ruffing 2009). The provinces are:

- 1) Ionians, Magnesians in Asia, Aeolians, Carians, Lycians, Milyans, and Pamphylians.
- 2) Mysians, Lydians, Lasionians, Cabalians, and Hytennians.
- 3) Hellespontines, Phrygians, Thracians in Asia, Paphlagonians, Mariandynians, and Syrians.
- 4) Cilicians.
- 5) The city of Posideium up to Egypt (except the Arabs), including Phoenicia, Palestina, and Cyprus.
- 6) Egypt, Libya, Cyrene, Barca.
- 7) The Sattagydiens, Gandharians, Dadicae, and Aparytai.
- 8) The Susians and the other lands of the Cissians.
- 9) Babylon and Assyria.

- 10) The Ecbatanians, the rest of Media, Paricanians, and Orthocorybantes.
- 11) The Caspians, Pausicae, Pantimathi, and Daritae.
- 12) The Bactrians as far as the Aegli.
- 13) The Pactyic region, the Armenians, and the adjacent regions as far as the Black Sea.
- 14) The Sagartians, Sarangians, Thamanians, Utians, and Mycians.
- 15) The Saca and Caspians.
- 16) Parthians, Chorasmians, Sogdians, and Arcians.
- 17) Paricanians and the Ethiopians of Asia.
- 18) The Matieni, Saspies, and Alarodians.
- 19) The Moschi, Tibareni, Macrones, Mossynoeci, and Mares.
- 20) The Indians.

These are the people paying tribute. Other people, only giving presents to the Persian king, are the Arabs, the Ethiopians, and the Colchians. The list is certainly not exhaustive. In the work of the same author, other people occur as well, e.g. in Asia Minor (1.170–180): Caunians, Calyndians, and Pedasians.

Also Xenophon (*Cyrop.* 1.1.4) gives a list of people subdued by Cyrus II: Medes, Hyrcanians, Surians, Assyrians, Arabians, Cappadocians, Phrygians, Lydians, Carians, Phoenicians, Babylonians, Bactrians, Indians, Cilicians, Sacians, Paphlagonians, Magadidians, Greeks in Asia, Cyprians, Egyptians, “and many other nations, whose names one cannot even say.” It should be noted, however, that the conquests of Xenophon’s Cyrus are not the same as those of the historical Cyrus (Ambler 2001: p. 287), e.g. Egypt was only conquered by his son Cambyses.

The Languages of the Achaemenid Empire: An Overview

Xenophon has it that Cyrus “ruled these nations even though they did not speak the same language as either he himself or one another.” Diodorus tells his readers that before the battle of Gaugamela the Achaemenid king “was most concerned lest some confusion should arise in the battle from the numerous people assembled that differed in speech” (Diodorus Siculus 17.53.4). In his Bīsitūn inscription, Darius I commands the diffusion of his text in his subordinates’ languages: “Afterwards this inscription I sent off everywhere among the provinces. The people unitedly worked upon it” (iv 91–92). Finally, in Esther 3.12 one may read that an order was to be sent “to every province in its own script and every people in its own language.”

These are only four examples of the multilingual character of the Achaemenid Empire, in which languages of various families were spoken. East Iran has its own languages and dialects (e.g. Arachosian, Bactrian, Sogdian), which was

already noticed by Strabo (*Geogr.*, 15.2.8). In the north, northern Iranian languages were spoken, whereas Elamite, Persian, and Median controlled southwest and central Iran. In Egypt, Mesopotamia, the Levant, and Anatolia people continued to speak their own languages: Egyptian, Babylonian, Aramaic, Phrygian, Anatolian languages (Lycian, Lydian), Greek, etc. (see Chapter 54 The Interplay of Languages and Communication).

Language and Administration in the Achaemenid Empire

After their glorious military expeditions which resulted in the creation of a huge territorial empire (Figure 3.1), the Achaemenid kings faced a political unit with lots of different ethnic groups as well as languages. It was a daunting task to keep such a large territory together. The Achaemenid administration especially had to deal with various administrative systems in different languages. The big challenge here was to communicate commands and directives to the various satrapies and to make these orders comprehensible for the non-Persian-speaking inhabitants of these satrapies, even more so knowing that the knowledge of Old Persian, the king's and the Persian elites' vernacular, was not widespread in the empire (Briant 1996: p. 525).

In fact, in order to solve these linguistic problems the Achaemenids conducted an active language policy (Tavernier 2008; 2017; 2018; forthcoming). The main basis for the reconstruction of this policy is the many administrative formulas at the end of, e.g., letter-orders. Such formulas are attested in Aramaic texts (from Egypt as well as from Bactria), Egyptian (demotic) texts, and Elamite texts. They reveal a coherent system, imposed by the Achaemenid kings and used throughout the existence of their empire, both geographically and chronologically. The formulas are attested from the reign of Darius I (521–486 BCE) to that of Artaxerxes III (358–338 BCE) in texts from Egypt (Arsames Correspondence [Aramaic], Pherendates Correspondence [Egyptian]), Persia proper (Persepolis Fortification and Treasury Archives [Elamite]), and Bactria (Akhvamazda Correspondence [Aramaic]).

The administrative notes are attested only on letters from the satrap or from his administration; letters to satraps do not have these formulas. Unfortunately, this implies that outside of the satrapal administration the Achaemenids' dealing with multilingualism cannot be reconstructed. In addition, the evidence for this system does not cover the whole Achaemenid territory, as it is not attested in Anatolia, although various Aramaic inscriptions were found there.

The formulas are:

Language	Level 1	Level 2	Level 3
Aramaic	1) PN ₁ knows this command 2) PN ₁ is the master of the command	PN ₂ is the <i>sepīru</i>	PN ₃ wrote
Egyptian	PN ₁ knows this command	PN ₂ is he who wrote this letter	PN ₃ wrote
Elamite	1) PN ₁ knew about this 2) PN ₁ delivered the command	PN ₃ received the draft from PN ₂	PN ₃ wrote

From these formulas a reconstruction model of how royal or satrapal commands were created can be drawn up:

- 1) A high official (e.g. satrap) passes a (royal) command in Old Iranian to one of his officials. This person (PN₁) is the one who knows the command.
- 2) The official transmits the command to the interpreter (PN₂) in Old Iranian. This is equivalent to formula P.
- 3) The interpreter notes it down in Aramaic.
- 4) If necessary, the interpreter also makes a translation into Egyptian or Elamite.
- 5) He passes this translation to an indigenous scribe (PN₃).
- 6) This scribe makes an additional copy, the copy of which is preserved.

The interpreters-scribes, called *teppir* in Elamite, *spr* in Aramaic, and *sepīru* in Akkadian, occupied a considerable position in the Achaemenid administration. This is corroborated by the high rations they received according to the Persepolis Fortification Tablets (Tavernier 2007b: p. 63). In fact, interpreters (ἑρμηνεύς) occur frequently in the Greek sources (e.g. Xen., *Anab.*, 1.2.17 and 8.12).

This also implies that Aramaic, although it did not supplant the local languages which remained in use throughout the Achaemenid period (Briant 1996: p. 524), was imposed on the empire as an administrative language. It lay as a veil on the whole territory of the Achaemenid Empire. In this capacity, Aramaic was the linguistic binder of the empire, the language used throughout its territory, between the Old Persian level and the local administrative level. The following table makes this clear:

Administration level	Language
King, satraps	Old Persian
Administration: top level	Aramaic
Administration: local level	Egyptian, Elamite, etc.

Through this system, the Achaemenids managed to keep their realm together and to put up an efficient state administration. Yet, further studies will hopefully deepen our knowledge of the Achaemenid language policy.

CHAPTER 4

Languages and Script

Adriano V. Rossi

The ethnic and linguistic diversity of the Achaemenid *oikumene* impressed the external observers (the Bible, classic writers). The typical Achaemenid approach to this diversity was condensed in the Old Persian (OP) terms *vispazana-/paruzana-*, “(with) all/many kinds (of people)” translated into Babylonian as *ša naphar lišānu gabbi*, “of all nationalities (?)”.

Epigraphy documents the usage of different languages in the Achaemenid administration. Aramaic was, or was becoming, a sort of *vehicular language* (not *official*, Folmer 1995: p. 13), while local languages kept on being used in private texts, in the local administrations, and in some royal proclamations.

Despite the diffusion of so many languages, only three were used for the monumental records: OP, Elamite, and Babylonian. Different degrees of bilingualism and/or diglossia have been hypothesized.

The Achaemenid inscriptions are presumed to have been planned in OP, an Indo-European (IE) language close to Avestan; the people associated with that language were the Achaemenids, who we conceive as an ethnic élite, settled in Fārs at an undetermined period (traditionally fixed at the end of the second millennium BCE, even if it could be antedated at least at the first half of that millennium). Although the basis for OP must lie in a southwestern Iranian dialect, **the specific variety attested in the inscriptions is likely to correspond to a literary, artificial form of it.**

It is commonly assumed that the specific cuneiform writing adapted to the language, the “OP script,” has not been used before Darius: the scribes of Cyrus seem to have used Babylonian, even if the extent of the documentation

attributable to Cyrus is much reduced. Nonetheless, trilingual inscriptions (OP, Elamite, and Babylonian) are attested at palaces built by Cyrus at Pasargadae. Many scholars claim that the OP version was probably added later. Nylander (1967), who investigated the matter, questions that all OP inscriptions bearing Cyrus' name were forgeries by order of Darius (also Schmitt 2007: pp. 28–31), and believes that while Cyrus wrote the original texts in Elamite and Babylonian, Darius added their OP versions. Vallat (2011: pp. 277–279) supports their authenticity for paleographical reasons.

Even more complicated problems are posed by two gold laminae bearing inscriptions of Darius' great-grandfather Ariaramnes and his grandfather Arsames, which may or may not be authentic.

It is uncertain whether the OP script was really invented during Darius' reign, as became fashionable to claim after Weissbach's siding (1911: pp. lx–lxi; Weissbach changed his mind before 1930, cf. Schaefer 1930: p. 293). As Diakonoff (1970) argued, the OP script may have been devised to write Median, or any other Iranian language. For those scholars who do not want to subscribe to Diakonoff's views, the inconsistencies of the OP script can be explained on the basis of a principle of economy: only the signs that were necessary to avoid ambiguity would have been created.

The problem of the language(s) and the script(s) used in everyday life on the plateau remains open. One could assume, with Grantovskij (1998: p. 342), that “Iranian languages had been subject to interdialectal merging long before the rise of Media;” Lecoq has pointed at the language of the inscriptions as a literary language (1974: pp. 56–58, 1997: p. 50), an interdialectal koiné (1974: p. 61). Kellens (2002: p. 455) suggests an interpretation in terms of *sabir*/lingua franca, Henkelman (2011: p. 615 fn. 105) of diglossia.

A document which could hint at the relation between royal proclamations and their dissemination is a passage in the Bisotun inscription, in which Darius says something about the monument/inscription itself, but a question about the interpretation of this passage (= OP § 70, Elam. Inscription L) has been going on for more than 100 years, and there is no consensus to date (research report: Rossi 2020). The Aramaic version of the inscription found at Elephantine (Folmer 1995: pp. 741–742) hints at an important role of this language, but surely not as pervasive as suggested by Sancisi-Weerdenburg (1999) because of the scanty Aramaic evidence on the plateau.

Other ancient Iranian languages could be ascribed to the Achaemenid world. “Median” is a cover term used for the minimal Old Iranian remnants in the OP inscriptions (names, specific vocabulary items, etc.) and other sources (especially Elamite tablets), whose phonology departs from that which is believed to be “typical OP.” “Median” does therefore not refer to a specific language (theoretically a northwestern Iranian language, in view of its location) but is merely a conventional label (Rossi 1981, 2017b). Since the 1980s the

Median component in Late Iron Age Iran has been strongly reduced, and the nerve-racking search for a Median language and script as a major feature connoting the “Median State” collapsed (Schmitt 2003; Rossi 2010, 2017b). Even less can be said about the languages of the nomadic tribes known as Scythians/Saka (Mayrhofer 2006).

Moreover, as before the Achaemenids emerged the Iranian plateau had been inhabited by peoples who spoke Elamite (language with no relatives, attested in cuneiform inscriptions from the twenty-third century BCE), there is no surprise that an important administrative language was Elamite in its Achaemenid variant. Gershevitch (1979) thought that Achaemenid Elamite was OP written ideographically, while OP versions were mere duplications for display purposes, but he never revealed the details of this “alloglottography” theory (Henkelman 2011: pp. 614–622) and therefore was strongly criticized by Elamitologists (in favor: Rubio 2006; research report: Rossi 2006).

Thirty thousand Elamite tablets and fragments were found at the Fortification wall on the Persepolis Terrace; 750 tablets and fragments in the “Treasury” area. Hundreds of tablets present Aramaic ink epigraphs; 163 Aramaic inscriptions on mortars, pestles, etc. which were found in the same “Treasury” area probably record the manufacture and their payment to treasurers in Arachosia (not their “ritual” use as believed by its editor Bowman).

According to Shaked (2003), it is reasonable to assume that knowledge of Aramaic, among speakers of Iranian, was confined to the scribes, who were conversant with OP in oral communication and with Aramaic in its written form. The earliest scribes could have been native speakers of Aramaic, who learned Persian; subsequently they may have been native speakers of Persian, who learned Aramaic as a written language.

At Persepolis, similar processes may have been active for Elamite. The officials who required the services of scribes probably preferred people who spoke their own language – Persian – with lesser attention to their fluency in Elamite.

The discovery of an isolated example of OP on a Persepolis administrative tablet (Stolper and Tavernier 2007) could change the accepted view of the functional differentiation between OP, Elamite, and Aramaic. This document actually contravenes stated expectations: at least one scribe wrote Persian language in Persian script and expected someone else to know how to read it. Gershevitch (1979: p. 143, cf. his “alloglottography” above) had insisted that there was not “the slightest chance for Old Persian written in Old Persian script ... to have ever been in general use” (with different presumptions also Schmitt came to similar conclusions: “das Altpersische [hat] für die eigentliche Verwaltung [...] keine Rolle gespielt,” 1993: p. 81).

Only hypotheses can be advanced to explain the existence of this tablet, but it is possibly the sole evidence of a larger group of documents, and therefore of more widespread recording in OP.

Evidence of multilingualism in the Achaemenid administration is provided not only by the interplay between Elamite and Aramaic language usage on the Persepolis tablets but also in the Aramaic name inscriptions on seals owned by personages whose primary language ought to have been different from Aramaic (Garrison and Root 2001: pp. 7–9).

All mentioned evidence reinforces the assumption that the Persepolis archive, like many others of the earlier Near East, represents the simultaneous use of several languages and asymmetric interference among them.

The relation between Elamite and Aramaic in the scribal practice of the Fortification texts has been discussed by Tavernier (2008); see also Rossi (2017).

The scribes using the Aramaic script, called *teppi*- in Elamite, are almost universally believed to write on parchment, but we do not have any Aramaic text ‘on parchment’ relatable to the tablets which contain this indication.

Note that the *teppi*-s whose names are preserved have Iranian names.

From the study of the different redaction patterns appearing in the Elamite tablets, Tavernier reconstructs three steps: (i) a Persian officer dictates an order in OP to employee A; (ii) employee A delivers the order to employee B, who makes an Aramaic translation (*tumme*) and gives it to employee C; (iii) employee C writes an Elamite copy (central administration), or a Demotic, etc. copy (peripheral administrations), of the *tumme* (see Chapter 3 Peoples and Languages).

The reconstruction is complex and entails many crucial assumptions impossible to discuss here (different interpretation: Vallat 1997); even Tavernier points out that only for a minority of the tablets this process could be envisaged, while according to the common procedure most likely the translation was directly from OP into Elamite.

Summing up, while on many details our vision of the Achaemenid multilingualism is much more advanced than in previous generations of scholars, the overall framework still eludes us.

CHAPTER 5

Onomastics

Rüdiger Schmitt

For the Achaemenid Empire evidence of personal names is much more extensive than that of geographical names (toponyms, names of countries [together with the ethnonyms derived from them], river names, and oronyms). As they have much greater importance for the historian looking at the empire, too, they are given priority in the present chapter.

Personal Names: Evidence

Evidence of personal names belonging to the Achaemenid period is considerable, even if in the Old Persian royal inscriptions themselves fewer than 50 names are attested (cf. Mayrhofer 1979). Among them a first large group are the names of the early kings (*Haxāmaniš*, *Cišpiš*, *Ariyāramna*, *Kuruš*, *Kambūjiya*), some of which being rather unclear, then the etymologically transparent throne-names (cf. below) of Darius and his successors (*Dārayavauš*, *Xšaya-ṛšan*-, *Ṛta-xšaça*-) and names of other Achaemenids (*Ṛšāma*, *Vištāspa*, *Bṛdiya*). Other lots are the names of Darius' fellow conspirators and their fathers, of members of the court, of Darius' generals and satraps, and finally the names of the disloyal pretenders to the throne rebelling against Darius, part of them being non-Iranian in origin.

Since the Achaemenids ruled a multinational and multilingual empire covering for a while almost the entire Near East from the Aegean Sea to the Indus river and including Egypt, Old Iranian personal names are attested in a lot of

sources written in the numerous languages (and writing systems) of the various peoples of the empire and of those in connection with it. The most important, but not the only branches of this so-called collateral tradition of Old Iranian anthroponyms, are the Elamite, Babylonian, Aramaic, and (Hieroglyphic and Demotic) Egyptian sources. From outside the empire it is in particular the Greek evidence that is found in the contemporary literature, even if the onomastic credibility of the individual authors may differ considerably (as we see, e.g., from the comparison of the names of the fellow conspirators as attested by Herodotus and Ctesias respectively with those found in Darius' Bīsutūn inscription DB). The most comprehensive collection for the period and the languages of the Achaemenid Empire is Tavernier (2007), with the Greek evidence excluded; not such a strong restriction is followed by Hinz (1975), who had attempted a similar collection, which should be used with caution, however. In every of the partial corpora of anthroponyms of that period, in the royal inscriptions as well as in contemporary Greek literature, the Achaemenid Empire's character as a multinational and multilingual state is clearly reflected.

More than 2000 anthroponyms, the great majority (about 90%) being of Iranian origin, are attested in the Elamite texts found in Persepolis (Fortification and Treasury Tablets) and thus come from the center of the empire itself, right where those names were in actual use. As a rule, the Iranian names differ so clearly from the Elamite anthroponyms that they can be assigned to Iranian quite easily. The whole of the evidence is collected and analyzed now in Tavernier (2007). The interpretation of this material with regard to Iranian is somewhat complicated by the all too irregular and superficial representation of the Iranian forms by the Elamite spelling, so that often varying Old Iranian original forms were reconstructed.

Similarly, in Babylonian texts from Achaemenid times, chiefly civil law documents (e.g. contracts and economic texts), a large number of individuals from all levels of Babylonian society (members of the royal house, officials, agents of commercial firms, and even chattel slaves) are attested; most of them bear Babylonian names, but we know also more than 600 Iranian anthroponyms from these sources. To these must be added the names attested in the royal inscriptions and those in astronomical texts. Apart from the usual difficulties caused by the blurred rendering of the Iranian names in Babylonian writing, the linguistic analysis of this material (collected now in Zadok 2009) is hampered by its distribution over the whole of Mesopotamia and of the Achaemenid period. The onomastic data testify by the way to a stronger acculturation of the Iranians there, since many individuals bearing a native Babylonian idionym have an Iranian patronymic or an ethnic indicating Iranian descent.

In the many texts written in Official Aramaic dispersed over the whole empire, among them the hundreds of papyri uncovered in Egypt, apart from

Aramaic and other names also a lot of Iranian anthroponyms are attested, which are only in part available in recent compilations (cf. Porten and Lund 2002). Moreover, some books of the Old Testament (written in Hebrew or Aramaic) contain dozens of Iranian names relating to Achaemenid times.

In Achaemenid Asia Minor, Old Iranian personal names are found in Lycian and Lydian inscriptions, not rarely also in Greek ones belonging to that time, whereas the later evidence shows that names originating in the Achaemenid period in some strongly Persianized regions lived on for centuries.

The principal focus of the Greek collateral tradition of Old Iranian anthroponyms is the literature, mainly the historians of the classical period (Herodotus, Thucydides, etc.), and in particular those authors who dealt with the Achaemenid Empire, with the Persian Wars, or the Greeks living in Asia Minor under Achaemenid rule. This material is collected and analyzed now in Schmitt (2011).

Iranian Names

- 1) Morphology: The system of the formation of personal names in the ancient Iranian languages is in principle the same as in the cognate languages, i.e. it is inherited from Proto-Indo-Iranian and Proto-Indo-European times. All of the various types of names (single-stem names, two-stem compound names, names shortened from compound names, and hypocoristics) are attested in Old Iranian and thus either in Old Persian itself or in the collateral tradition (cf. Schmitt 1995, 2005).
- 2) Dialectology: The numerous anthroponyms attested in the Elamite-language corpus of the Persepolis tablets offer a cross-section (even if not a representative one) of the population, as do in that late period those mentioned in the Babylonian-language private documents, so that one may recognize people of quite different tribes and nations. But the forms of the names let us also make out features of different Iranian dialects, and rather clearly in cases where pairs of names reflect such divergent phonetic development. It is remarkable that Old Persian forms appear in the Babylonian and Aramaic versions of the royal inscriptions, usually in non-Persian (probably Median) dialect forms.

Since in the formation of names not only the living and productive vocabulary of the time is used but, owing to the often traditionalist tendency of name-giving, also archaic and foreign lexemes that in the past had become part of the “onomastic vocabulary,” hybrid formations were possible, too, in which elements of different linguistic (or at least dialectological) origin are joined together.

Particulars

- 1) Motives for name-giving: Anthroponyms are not primarily motivated by the lexical meaning of their constituents; insofar they may not be understood as “meaningful” forms. Usually they can be interpreted as wishful names, by which the parents express their hope of strength, wealth, noble-mindedness, intelligence, or the like for their newborn child. For the motivation of choice, in particular cases the most common procedure is the custom of choosing some name that has already appeared in the father’s (or the mother’s) family, e.g. by naming the grandson after the grandfather (as in the series of Kuruš–Kambūjiya–Kuruš–Kambūjiya or Ochus–Arses–Ochus–Arses, if one takes the birth-names of the kings Darius II, Artaxerxes II and III, and Arses [= Artaxerxes IV?]). A popular means of expressing the family’s feeling of belonging together is to form a series of half-parallel, half-varying names by repeating one element of the father’s name in the sons’ names or one and the same element in the names of several brothers. Apart from the family tradition, name-giving after figures of history, mythology, fable, etc. can be observed. Because of such traditional giving of names one must be cautious about drawing any conclusions from names, e.g. those regarding the parents’ religious convictions.
- 2) Throne-names: The Achaemenid kings’ custom of changing the name at accession to the throne and to take a “throne-name” or “royal name” instead of the birth-name or private name is well attested in two independent traditions, viz. in Greek (and Roman) literary sources as well as in Late Babylonian chronicles and astronomical texts, that decisively confirm the literary evidence (cf. Schmitt 1982). Whereas in the official royal inscriptions only the throne-names appear, collateral tradition informs us about the birth-names of Artaxerxes I to III and Darius II and III, too. The throne-names assumed by the newly-appointed kings express some religious–political program or motto: OPers. *Dāraya-vauš* (Darius) “Holding firm/retaining the good”; *Xšaya-ṛšan-* (Xerxes) “Ruling over heroes”; and *Ṛta-xšaça-* (Artaxerxes) “Whose rule is through Truth (or sim.).” Since OPers. *Dārayavauš* is such a throne-name for certain, but the institution is attested already before Darius II, it seems to be obvious to postulate a throne-name already for Darius I (cf. Schmitt 1982: p. 93 = Schmitt 2000: 172f.). That the institution of throne-names actually began just with this king, who came to the throne not by normal succession, may be combined with the apparent break in the tradition of royal names just here, when the series of etymologically unclear and disputed names like *Cišpiš*, *Kuruš*, and *Kambūjiya* is followed by those fully transparent programmatic throne-names.

- 3) Onomastic and prosopographical identity: Since the evidence of Old Persian anthroponyms in genuine sources is rather limited and the wealth of material preserved in the collateral traditions often is not rendered accurately enough, it is important to join together for each single name all the material which eventually belongs together, in order to find out the original form (or forms) as exactly as possible. It is known that in particular the transcriptions in Mesopotamian cuneiform (i.e. in the Elamite and Babylonian languages) are not very precise, as we see, e.g., from the countless spelling variations mainly of the royal names (in the case of Darius more than 100). In general, one has to compare all the attested forms down to the last detail, because not rarely variant forms, e.g. a two-stem compound name and a shortened form or an allegro form, appear next to each other (cf. four-syllable OPers. *Xšāya-ršā* vs. two-syllable Gk. Ξέρξης).

Apart from the royal names and from the inscriptions recorded in several versions, the first question to be asked in such cases often is simply whether we have to do actually with one and the same name at all. Therefore evidence of both onomastic and prosopographical identity is particularly welcome and significant, not least material connecting the various branches of the tradition including the collateral one. For instance, Elamite evidence proved to be of decisive importance for identifying the original Old Persian forms of the names of the famous general Gk. Δᾴτις and the princess Ἀρτυστῶνη, as Elam. *Da-ti-ia* and *Ir-taš-du-na* gave unambiguous hints to OPers. **Dātiya-* and **Rta-stūnā-* respectively. Similar relations may be observed also between Greek and Aramaic or Babylonian evidence, e.g. for Σπιδάμας, son of Πετήσας (in Ctesias F 14 § 42), and *Is-pi-ta-ma-*, son of *Pa-te-e-šú*, in a document from the Murašû Archive dated 424/23 BCE (cf. Schmitt 2006: p. 193). And by equating the name Gk. Ἰερამένης with Lyc. *Eriyamāna* (both being closely connected with Τισσαφέρνης, Ὑδάρνης and *Kizzaprñna*, *Widrñna* respectively), even the Lycian Xanthus stele is a great help to make the Greek form understandable. It must be said, however, that something like a “*Prosopographia Imperii Persici Achaemenidarum*” is missing, as the study of Balcer (1993) is neither sufficient nor reliable.

Also more general points of view should be kept in mind, e.g. the fact that according to the Bīsūtūn text, all of the generals loyal to the king were Iranians, either “Persians” (as *Vaumisa*, *Dādṛšiš*, *Rtavardiya*, *Vivāna*, and *Vindafarnā* are explicitly called) or “Median” (*Taxmaspāda*), or at least bore an Iranian name (as the so-called “Armenian” *Dādṛšiš*, who may have his ethnic name only in contrast to some namesake). Now, things are similar with Herodotus’ list of the commanders of Xerxes’ army (7.61–97): all of them and their fathers (as far as they are mentioned) bear anthroponyms of Iranian origin and

therefore presumably were Iranians. A number of them are expressly called “Persians,” too, and some even especially “Achaemenids.” However, a warning against the information given by Herodotus (8.90.4): on the occasion of the battle at Salamis, he mentions that in case of some particular action, Xerxes had the name of a man written down together with his father’s name and his home town. The patronymic may have been given indeed (as we see from the list of Darius’ followers in DB IV 83–86), but to give also the native town seems to be a Greek way of thinking and has no Persian parallel.

Non-Iranian Names

In the Achaemenid Empire there are attested not only Old Iranian names but also, just as was to be expected in such a multinational and multilingual state, those of other provenance. In the Old Persian royal inscriptions we find Babylonian (*Nabukudracara*, *Nabunaita*, *Nadintabaira*), Elamite (*Aθamaita*, *Imaniš*), and even Urartian names (*Araxa*, *Haldita*). That the respective names abound in the particular linguistic corpora, viz. Semitic anthroponyms in the Babylonian and Aramaic inscriptions and documents, Elamite names in the Elamite Persepolis tablets, Egyptian ones in the Hieroglyphic and the Demotic texts of the period, is no surprise. The same is true also for the relevant Greek sources, where Babylonian (e.g. Ἀνδία, Λαβύνητος), Elamite (Ἀβουλίτης), Egyptian (e.g. Οὔσιρις, Πετησάκας, Πετήσας), etc. anthroponyms likewise are attested.

Of special interest is the onomasticon of the Persepolis tablets, where most of the non-Iranian names are of Elamite origin. They can be made out especially where the same form is found already in pre-Achaemenid Elamite texts or they contain without any doubt typical Elamite components. Zadok (1984) had attempted a formal analysis and reduction of Elamite names to their components and at the same time listed those onomastic componential stems. A more detailed interpretation is impeded, however, by the fact that the meaning of Elamite lexemes mostly is not exactly known; therefore Zadok’s typological sketch of the names has a more provisional character. A particular group of names are the hypocoristics, which are collected and analyzed by Zadok (1983); the most striking and the main type of such hypocoristics are forms with a reduplicated final syllable like *Ba-(iz-)zi-zi*, *Ha-pu-pu*, *Mi-te-te*, *Ša-at-ru-ru*, etc. (cf. Mayrhofer 1973: pp. 306–309; Zadok 1983: pp. 96–107). Sometimes those formations seem to have been modified to Old Persian hypocoristics in **-iā-*; in any case Koch (1990: pp. 171, 186, 213) drew this conclusion from couples like *Zi-ni-ni* vs. *Zi-ni-iz-za* and *Mi-te-te* vs. *Mi-te-iz-za* (cf. Hinz and Koch 1987: pp. 939, 1301), for which the prosopographical identity of the name-bearers may be inferred from the closeness of the contexts in which the names actually occur.

Babylonian names are attested in a still larger number, but there is no full collection of that material available, since that of Tallqvist (1905) has become outdated for a long time. As to the formation of the names, a lot of different types can be observed, one-stem, two-stem, or multi-stem names, shortened names, etc., in a way like the Indo-European and Iranian types of names but in the particulars quite different from them. Characteristic of Semitic name formation are chiefly the so-called sentence-names, by which a normal statement as well as a demand, wish, or question may be expressed. In general, also the Late Babylonian anthroponymy is the same as it was in the two millennia before. A comprehensive treatment of name-giving in Akkadian is found in Stamm (1939), a sketchy survey (with only a rudimentary typology) in Edzard (1998–2001).

Geographical Names

Our knowledge of geographical names of the Achaemenid period and the Achaemenid Empire is rather sketchy. From the royal inscriptions themselves the names of the countries (OPers. *dahyāva*) or satrapies of the empire and the ethnic names belonging to them are best known, in addition to a few toponyms, oronyms, and hydronyms. There are also large numbers of toponyms from the Elamite Persepolis tablets, which for the most part can neither be analyzed linguistically nor be localized exactly, however. Altogether those scanty onomastic relics do not allow any conclusions concerning the distribution, settlement, and spread of the various Iranian and non-Iranian nations. Research on the geographical names of Iran, based primarily on the inexhaustible information found in the medieval Arabian geographers and the modern maps as well as on topographical studies on the spot, has been furthered especially by Wilhelm Eilers (cf. Eilers 1982, 1987, 1988). His publications made clear that such names were kept tenaciously for thousands of years over all political, cultural, ethnic, and linguistic changes. Eilers expounded also the thesis that we have always to reckon with the spread from one category of names to another (e.g. from the name of a country to its capital city, from a river's name to that of the country irrigated by it, and so on), so that in any case it must first be clarified what was named by the form in question at the outset.

From those later sources we cannot gain essential information, however, for the Achaemenid times. So we have only a few certain entries on a virtual map of the Achaemenid Empire (see Vallat 1993; Tavernier 2007). The names of countries attested in the appropriate lists in part are confirmed, as regards eastern Iran, by some passages in the corpus of the Avesta describing the countries settled by the “Aryans,” i.e. Iranians (esp. Yašt 10.13–15; Vīdēvdād

1.2–19). In the Old Persian inscriptions most of the names of eastern Iranian countries are attested not in the original dialect form but as transposed into the Old Persian equivalent (OPers. *Harauvati*- “Arachosia” vs. Avest. *Haraxʾaitī*-; OPers. *Uvārazmī*- “Chorasmia” vs. Avest. *Xʾāirizəm*; OPers. *Θatagu*- “Sattagydia” vs. **Satagu*-), whereas the Babylonian, Aramaic, and in part also the Elamite collateral tradition normally has the original forms (e.g. Babyl. *A-ru-ḫa-at-ti*, etc.; *Ḫu-ma-ri-iz-mu*, etc.; *Sa-at-ta-gu-ú*, etc.). Only the name of Bactria is attested in a non-Persian, presumably the original, form as OPers. *Bāxtri*-, whereas the Old Persian equivalent **Bāxçi*- is reflected by Elam. *Ba-ak-ši(-iš)*. The ethnic names, which are derived from the names of the countries either without suffix (e.g. *Pārsa*- “Persia” → *Pārsa*- “Persian”) or with *-*iya*- (e.g. *Maka*- “Mekrān” → *Mac-iya*-) and in one single case with lengthened grade (*Margu*- “Margiana” → *Mārgav-a*-), are listed by Schmitt (1999: p. 450).

Apart from the names of the royal capital cities Persepolis, Susa, Babylon, and Ecbatana (OPers. *Pārsa*, *Çūšā*, *Bābiruš*, *Hagmatāna*), only a few names of districts as well as of towns and fortresses are found in the royal inscriptions, among them several of Semitic origin (such as *Izalā* in Assyria or *Arbairā*/Babyl. *Ar-ba-ʾil* “Erbil”). One of the few names of the Elamite Persepolis tablets which can be localized with certainty is that of Shiraz (Elam. *Ti-ra-(iz-)zī-iš*, *Ši-ra-iz-zī-iš* [= MPers. *šylʾc'*, once also *šylʾc'*], probably rendering OPers. **Θīrāčī*-; cf. Klingenschmitt 1980: p. 21). We are in a similar situation with the richest source of the classical geographical literature, viz. Ptolemy’s “Geography,” which provides only a few connections with the Elamite evidence.

The two great rivers of the Near East, Euphrates and Tigris, are called OPers. *Ufrātu*- and *Tigrā*- respectively in the Bīsutūn inscription; both of these forms are to be understood as reinterpretations of the pre-Semitic and probably even pre-Sumerian hydronyms Akkad. *Purattu*, *Idiglat*, or Sumer. *Buranun*, *Idigna* by folk etymology: *U-frātu*- as “With good fords” and *Tigrā*- as “Quick as an arrow-shot.” The contrast between the slowly flowing and easily crossed Euphrates and the rapidly raging Tigris which is passable only by boat (cf. DB I 86 *nāviyā*) is extremely well confirmed by the actual conditions. Also the name of the Nile river is attested in one of the Suez inscriptions (DZc 9) as *p-i-r-a-v*/Pirāva/, the form of which obviously renders the Egyptian name *pꜣ-jtrw*, “the river.”

Several Iranian rivers are called OIran. **Kuru*- (Gk. *Kῦρος*, *Kόρος*), the name of which was discussed in great detail by Eilers (1964), who interpreted it as “blind,” i.e. either “dark, murky” (namely muddy) or as “silting up, drying up” or similar. Other hydronyms can be made out for the Achaemenid Empire only as resulting in a country’s name (by application of a river’s name for the whole land irrigated by it), e.g. OPers. *Harauvati*- “Arachosia” (cf. Schmitt 2001).

Hardly any oronym is attested for ancient times. From the royal Achaemenid inscriptions we know only Mt. Lebanon (OPers. *Labnāna*), where the cedar-timber came from, and Mt. *Pr̥ga* (cf. NPers. *Furg*) and Mt. *Arakadri*, both of which probably are situated in southeastern Fārs.

SECTION III.A

WRITTEN SOURCES

CHAPTER 6

The Inscriptions of the Achaemenids

Adriano V. Rossi

The Achaemenid royal inscriptions together with the Elamite administrative tablets from Persepolis are the most important direct sources to reconstruct Achaemenid history. Even if they provide less insight into the Achaemenid state organization than is commonly thought (political and administrative events are generally not recorded in them), they have the advantage of being contemporary to the events. Most of them have been found in Persis (Persepolis, Naqsh-e Rostam, Pasargadae), Elam (Susa), and Media (Bisotun, Hamadan). From outside the central regions of the state, barring the few inscriptions on objects and clay tablets, we know of three inscriptions by Darius from the Suez Canal, a rock inscription by Xerxes from lake Van in Armenia, and fragments of inscriptions from Babylonia.

While the Teispids basically produced monolingual inscriptions (Rollinger 2015: p. 117; see below for Kyros' name at Pasargadae), most of the inscriptions of Darius I and his successors were trilingual (OP, AE, LB). They are mostly engraved on rock walls, architectural elements, reliefs, and sculpture from royal residences or smaller portable objects connected to the activity of the court; an exception are the inscriptions on the statue of Darius I found at Susa, on which, besides the usual trilingual, hieroglyphic texts are carved (like other inscriptions from Egypt, cf. Briant 1999: pp. 99–113). Partial Aramaic translations of DB (late Achaemenid, end of the fifth century BCE) were found among the Elephantine papyri; this proves the circulation of the text in the didactic practice (the inclusion on the papyrus scroll bearing the Aramaic version of DB of various passages originating from different inscriptions points

to “a school-like milieu in which texts from the reign of Darius were not only studied but also used to create something new,” Rollinger [2015: pp. 125–126]) but not necessarily as an official act of the royal chancellery.

The sequence of the texts (OP>AE>LB) on the inscriptional supports and/or their spatial arrangement generally emphasizes the priority of OP on the other languages, of Elamite on Babylonian, though surely “written language was not part of the inherited sense of identity for Persian speakers” (Tuplin 2011: p. 158; about language and ethnicity, Stolper and Tavernier 2007: p. 22).

The bulk of the Achaemenid inscriptions, written on behalf of Darius, Xerxes, and the three Artaxerxes (especially the first), have possibly been planned in OP (see Chapter 3 Peoples and Languages), probably the (majority) language of the ethnic élite ruling over Fārs in the first millennium BCE. Although the basis for OP must lie in a southwestern Iranian dialect, ancestor to the Iranian dialects spoken in Fārs, the language attested in the inscriptions is likely to correspond to a *literary, artificial* form of it (Stolper 2005: p. 19; Jacobs 2012: p. 97); OP as we know it was probably a language “restricted to royal usage” (Schmitt 2004: p. 717).

The motivation underlying the choice of the three Achaemenid languages is not clear (Briant 1999: p. 94 suggests Darius’ intention to appear as “héritier des vieux empires ‘cunéiformes’ assyrien, babylonien et élamite,” cf. also Jacobs 2012: p. 105 fn. 57), and it is probably not by chance that “Elamite was the first language used by the Achaemenids for formal inscriptions” (Stolper 2004: p. 63; also Henkelman 2011: p. 585); perhaps “[t]he unbroken Elamite language tradition of Susa and Elam was continued with the inclusion of Elamite cuneiform in the [...] Achaemenid royal inscriptions” (Schmitt 1993: p. 457), even if it is difficult to determine the exact linguistic relationships between OP and AE (on Gershevitch’s [1979] hypothesis of an “alloglottography” of OP, never effectively proved and at odds with much AE evidence, cf. Stolper 2004: p. 64; Rossi 2006: pp. 78–84; Henkelman 2011: pp. 614–622; on AE and its contacts with OP cf. particularly Henkelman 2008: pp. 86–88, 2011: pp. 586–595, 614–622).

According to Jacobs (2012: pp. 103–104), the mere existence of DPd,e (OP), DPf (AE), DPg (LB) on the southern wall of the Persepolis Terrace, a four-column inscriptional complex attesting not different translations of a same original but a unitary discourse, points to a multilingual (and multicultural) ability to interpret the relevant metatext (on DPd,e,f,g cf. also Filippone 2012); Jacobs (2012: pp. 111–114) suggests an “ideal model of the ‘polyglot’ king,” as elaborated by Lanfranchi (2009: pp. 130–131) for the Neo-Hittite cultural area (in which “mastering foreign scripts and languages was clearly considered a point of honor for kings and rulers”). Most probably, anyhow, the Achaemenid usage of a quantity of languages has the same function as

displaying a quantity of different peoples in iconography (=OP *vispazana* “having all kind of people”; cf. Stolper 2005: p. 18 “trilingual inscriptions [...] emblems of the Achaemenid Empire’s immensity and complexity”).

It is commonly assumed – with no sure linguistic evidence – that the specific cuneiform writing created (at an unknown time) for the OP language, the “OP script” (its “name,” if any, is unknown, *pace* Hinz 1952: p. 30 and followers), has not been used before Darius: the scribes of Cyrus seem to have used Babylonian only, even if the extent of the documentation attributable to Cyrus is much reduced. Anyway, a few trilingual inscriptions are attested at palaces presumably built by Cyrus at Pasargadae, although many scholars claim that they were probably added later. Nylander (1967) questions that all OP inscriptions bearing Cyrus’ name were forgeries by order of Darius (Schmitt 2007: pp. 28–31): in his opinion Cyrus wrote the original texts in Elamite and Babylonian, Darius added their OP versions in a recently invented script. Vallat (2011: pp. 277–279) and the present author have supported the possible authenticity for all versions (mostly for paleographic reasons), even if one should admit in this case that the usage of OP script would have remained highly limited before Darius. Arguments in favor of Darius’ invention of it are critically examined by Huyse (1999: pp. 51–55, cf. Rossi [2020]); in favor of a greater antiquity have also been – for different reasons – Hallock, Mayrhofer, Diakonoff, Gershevitch.

As to the “oldest” OP documents, the two gold laminae bearing monolingual OP inscriptions of Darius’ great-grandfather Ariaramnes and his grandfather Arsames are hardly authentic; besides their linguistic “corruption” (Schmitt 1999: pp. 105–111, 2007: pp. 25–28), their appearing and disappearing from the international scene renders their contribution invalid.

The problem of the introduction of the OP script is closely connected to the interpretation of a Bisotun passage (DB/OP Section 70 = DB/AE L), where possibly the word for the whole epigraphic complex is OP *dipi[dāna-?]/AE tuppime* “the political message conveyed by the whole complex,” “Memorial,” cf. Rossi (2020: fn 75); Schmitt (2014: p. 169) reconstructs it as OP *dipi[ciça-* “[a]ls Bezeichnung der von Dareios “hinzugesetzten” (DB 4.89) altper-sischen Version von DB”. In the interpretation of the political message of DB/OP Section 70 = DB/AE L, I fully agree with Tuplin’s (2005: p. 226) sharp differentiation between “public display of a text with an iconographic component” (as for example the monumental reduced replica of the Bisotun Monument from Babylon) and “the more extravagant scenario of 70 in which the text alone will be sent ‘to the lands’ (i.e. throughout the empire).”

The scholars who assume that Darius wants to inform us that he had ordered the creation of a special script for his own language point to DP/OP §70 as a statement on this invention, irrespective of the fact that no royal inscription would mention such a detail – which is in itself extraneous to the “royal

discourse” – in the literacy conditions prevailing in any ancient Near Eastern country (cf. Rossi 2020).

The Bisotun complex (DB), carved high on the rockface dominating the main road leading from the Mesopotamian plain to Ecbatana, is an exceptional document (Schmitt 1990). It contains by far the longest Achaemenid royal inscription, strictly integrated with the accompanying relief (note: “inscription” OP *dipi-*/AE *tuppi*/LB *narú*, “relief” OP *patikara-*/AE *patikara*/LB *šalmānu*); most scholars believe that this is the oldest Achaemenid epigraphic complex. DB occupies a particular place among the Achaemenid inscriptions also with regard to its content. The first four columns relate how Darius took the power and coped with the uprisings that followed. A fifth column, added later, relates what happened in Darius’ second and third years; of this supplement, only an OP version was produced (for lack of space perhaps).

Careful investigation by German scholars (1963–1964) has revealed that the Elamite text was the first *carved* (not necessarily *produced*), followed by a Babylonian version, both of them flanking the relief. Only later was an OP copy inscribed below the relief. Part of the AE text had to be removed when the ninth rebel was added to the others, and the AE text was inscribed anew to the left of the OP text.

The relation between the texts attested in DB is still open to debate, however. At least two of them are translations, and it seems reasonable to assume that although the OP version was demonstrably (e.g. from some details of the minor inscriptions) *inscribed* later, it could have been the “original source text,” and not only as an oral text in the form of the king’s dictation (against the orality-only thesis also Henkelman 2011: pp. 614–622); Sancisi-Weerdenburg’s last stand (1999: p. 108), based on Borger’s (1982: pp. 106, 113, 130), seems to come back to the idea of an Aramaic original; Huyse (1999: pp. 57–58 and n. 66) hypothesizes an original ‘dictation’ in OP with a contemporary writing down in both Elamite and Aramaic (cf. Schmitt 1991: p. 20: “it may be (and indeed it has been) supposed that the text was originally written down (on the King’s Old Persian dictation) in the royal chancellery in both Aramaic and Elamite”; Schmitt [1998: p. 161] remains convinced that DB/OP is a retranslation from Elamite). The usage of Aramaic at some intermediate phase in the editing process has been hypothesized also by Sims-Williams (1981: p. 2) on the basis of two OP words “phonetically” transcribed in a fragmentary passage from an Aramaic DNb version. The present writer is convinced that all the texts of the Achaemenid royal documentation, including DB, are the product of the great activity of the efficient and influential royal chancellery to which the *verbal* expression of Persian kingship was assigned. Though acting on behalf of the king and with his (or his experts’) final approval, the scribal staff were responsible for the multilingual text

production, the way of organizing the information flow and selecting the lexicon with which the royal ideology was diffused and reinforced, and marking a set of countersigns aimed at the dissemination (cf. Filippone 2020; also Jacobs 2010, 2012). Particular attention to the audience of the royal discourse has recently been given by Jacobs (2012: pp. 110–114) and Rollinger (2014: pp. 203–204).

The exceptional length of DB allows focus on the ideological constructs and programmatic statements which we find also in other Achaemenid inscriptions (e.g. DN at Darius' tomb), all planned, together with their iconography, as an ethical and political message to his successors as well as an exhibition of royal power imagery for common people (cf. Jacobs 2010: pp. 108, 111, particularly contrary to the usage of the concept of “propaganda” in Achaemenid contexts).

Among the other inscriptions in the name of Darius and Xerxes, some are outstanding: those at Darius' tomb at Naqsh-e Rostam (DN) present the king as an ideal sovereign (for latest analysis of the interrelation between texts and iconography see Nimchuk 2001: pp. 68–91); the famous stone table discovered in the 1930s and known as “*Daiva* Inscription” (XPh) contains Xerxes' proscription of religious practices that were not devoted to the worship of Ahuramazda (Filippone 2010; Henkelman 2011: pp. 620–621; Rollinger 2014: pp. 200–201).

Among the minor trilingual texts there are a certain number of building inscriptions, connected with the palatial complexes at Susa and Persepolis (cf. for general information Stolper 2005: pp. 22–24; Rollinger 2015: pp. 117–121). Some texts (“foundation texts” in a broad sense, cf. Curtis, Razmjou 2005: pp. 56–59; Root 2010) were carved on stone (or precious metal) tables, in repeated exemplars laid in foundations and/or displayed in the buildings (as we know from fragments of display inscriptions in Susa bearing parts of the same inscriptions as those of the foundation tables, Steve 1974: p. 163). A series of short inscriptions (authorship marks) contains the name of the king and the denomination of parts of buildings, such as the inscribed knobs (Basello 2012) or the labels on the doorframes from Persepolis.

Longer texts containing statements by the king are separated into sections by the OP formula: *θāti xšāhyaθiya* “says the king.” A set of formulaic elements is generally present: an evocation to Ahuramazda, a statement of the king's name, royal epithets and genealogy; and a call for Ahuramazda's blessings on the king's works/land/household. The Achaemenid inscriptions contain Avestan echoes and more or less direct citations according to Skjærvø (1999) and Kellens (2002); on the attitude of the Achaemenids toward Ahuramazda and other religions see Jacobs and Trampedach (2013) and Jacobs (2014b). A list of subject lands/peoples (OP *dahyāva*/AE *dahyauš*/LB *mātātī*) is sometimes appended in different formats, but these variations

do not seem to point to actual political events (such as rebellions, changing role of different regions) since the narrative style of the royal discourse is mostly and intentionally timeless (cf. Sancisi-Weerdenburg 1999; Jacobs 2014a points to historical events that can be guessed in some specific cases).

A particular variant of these lists is contained in the inscriptions from the palaces of Darius at Susa (DSf, DSz), which list the subject lands/peoples entrusted with transporting and crafting the building materials. Short texts sometimes accompanying reliefs identify the figures as representatives of subject lands/peoples and are similar to those usually styled “label inscriptions” in Assyriology.

After Xerxes the royal inscriptions diminish in length, no lists of *dahyāva* are attested, and the only information besides genealogies concerns buildings (Rollinger 2014: pp. 201–202). A progressive change in attitude after Darius as regards the royal legitimation is studied by Jacobs (2014a).

Greek historiography reports about Achaemenid inscriptions that we do not possess. Some of them might have existed (Schmitt 1988), that (on (a) statue(s)?) at the Bosphorus, for which Herodotus (4.87.1) mentions two versions (στήλας ἔστηκε δύο [...] ἐνταμὼν γράμματα ἐς μὲν τὴν Ἀσσύρια ἐς δὲ τὴν Ἑλληνικά), may have been a quadrilingual monument as Darius’ statue (cf. recently Jacobs 2012: p. 110; Rollinger 2013: pp. 97–99, emphasizing Assyrian analogies).

An updated catalogue of all royal inscriptions is now available (Schmitt 2009: pp. 7–32); all other reference works (most quoted: Kent 1953, OP, now severely outdated) have only monolingual catalogues. Schmitt’s edition (2009: pp. 33–199) contains only OP texts and their German translations. A collection of OP texts (without DB) containing supplementary material data is Schweiger (1998); the only recent collection of all inscriptions in the three languages is Lecoq (1997, original texts not given). The first volume of a new critical edition (all Achaemenid royal inscriptions in all languages), by the DARIOSH editorial board, has appeared recently (Rossi et al. 2012; cf. also Rossi 2017).

CHAPTER 7

Elamite Sources

Matthew W. Stolper

Introduction

Almost all of the Elamite royal inscriptions are versions of texts that were also displayed in Old Persian and in Akkadian. In the nineteenth century, when these trilingual inscriptions provided the basis for the modern decipherment of the cuneiform writing systems, the consequent study of Elamite, like the study of Akkadian, led to a wider and deeper corpus of pre-Achaemenid records that documents centuries of previously unknown history. The Elamite corpus, however, proved to be much smaller, less diverse, less dense, and less continuous than the Akkadian corpus. It was also much less tractable. While the early study of Old Persian and Akkadian benefited from flourishing comparative and historical research on related Indo-Iranian and Semitic languages, early attempts to identify and exploit known languages connected to Elamite were vain or misleading. Evidence from the other versions of the multilingual inscriptions was fundamental to the interpretation of Elamite lexicon and grammar.

Almost all Achaemenid Elamite administrative documents come from two groups excavated at Persepolis in 1933–1934 and 1936–1939. This large corpus differs from the royal inscriptions in contents, in rhetorical register and purpose, in syntactic and stylistic complexity, and in grammatical and orthographic variation. From the late twentieth century on, these practical texts have provided a rich context both for internal analysis of Achaemenid

Elamite language and for understanding of contact between Elamite and other written and spoken languages around the Achaemenid courts.

Elamite Language

Achaemenid royal inscriptions normally refer not to Elam as a place but to Elamites as a people (Elamite *Hatamtip*). The indigenous ancient name of the language is not attested. The consensus modern term “Elamite” reflects Sumerian and Akkadian references to the “language of Elam.” Soon after the decipherments, recognizing that the language of Achaemenid inscriptions of “the second kind” also appeared in many older inscriptions from Susa, some scholars called the language “Susian.” Others, contemplating the royal title found in those older texts, “King of Anzan and Susa,” and surmising that the language was original to a region farther from Mesopotamia than Susa was, called it “Anzanite” – even though the location of Anzan long remained a matter of disagreement (Potts 2011: pp. 36–37).

No ancient languages are known to be cognate with Elamite, and no later languages are known to be descended from Elamite. The hypothesis that Elamite is distantly related to Dravidian languages, a matter of disagreement among modern scholars, has had no firm consequences for the elucidation of Elamite grammar or lexicon. In practical terms, Elamite remains a linguistic isolate (Stolper 2004: p. 61 with references; Starostin 2002 with review of proposals and lexical evidence).

Readable Elamite texts are written in versions of the cuneiform script that was developed in Mesopotamia to record Sumerian and Akkadian. The script was also adapted to record other Near Eastern languages between the third and first millennia BCE, including Eblaite, Hurrian, Urartian, and Hittite. The Elamite adaptation of this writing system is economical by comparison with the Mesopotamian applications of it in two senses. First, the number of characters is comparatively small: slightly more than 200 characters are attested in Elamite cuneiform writing from all periods. Only 100–150 are found in any period, about 135 in Achaemenid Elamite (Steve 1992). Second, the incidence of homophony (many characters with the same signification) and polyphony (single characters with many significations) is comparatively small. Late pre-Achaemenid and Achaemenid Elamite sign inventories include a comparatively high proportion of logograms (characters representing words) because large groups of administrative records come only from these periods.

In Achaemenid multilingual royal inscriptions, the mostly syllabic orthography of the Elamite versions required fewer characters than the Old Persian but more characters than the Babylonian counterparts. For example, in the seal inscription SDa, the phrase “I, Darius, King” requires 12 characters in Old Persian, 10 in Elamite, and even with the title expanded to “Great King,” 9 in

Babylonian. In the main Bisutun inscriptions, the first four columns of the Old Persian text cover c. 27.33 m², the corresponding three columns of the Elamite c. 21.5 m², and the corresponding Akkadian c. 15.33 m² (King and Thompson 1907: pp. xxiii–xxiv). As a result, symmetrical displays of versions often required adjustments of character size or spacing and sometimes motivated editorial differences (cf. Henkelman 2003; Kozuh 2003).

Almost all pre-Achaemenid Elamite cuneiform texts come from sites in modern Khuzestan and Fars. The northern and eastern extent of the area in which Elamite was spoken is a matter of dispute. The oldest documents from the areas where Elamite cuneiform texts are found are written in two as yet undeciphered scripts, called Proto-Elamite (using about 1000 characters, found on about 1600 clay tablets, most from Susa, a few from sites in Fars, Kerman, and Seistan, dated c. 3100–2900 BCE, see <http://cdli.ox.ac.uk/wiki/doku.php?id=proto-elamite>) and Linear Elamite (using about 100 attested characters, found on 21 or more stone, clay, and silver objects, most from Susa, one probably from Fars, one fragmentary and uncertain example from Seistan, another from Margiana, dated c. 2100 BCE; see <http://cdli.ox.ac.uk/wiki/doku.php?id=linear-elamite>). It is plausible but not demonstrable that both scripts record texts in Elamite language. If so, the area in which Elamite was once spoken perhaps included easternmost Iran.

The oldest datable Elamite text written in cuneiform script, a treaty with a Mesopotamian king, comes from about 2100 BCE. Other pre-Achaemenid Elamite texts include about 210 royal inscriptions on bricks, stelae, reliefs, statues, votive objects, and other portable objects; about 400 administrative texts (almost all in two archival clusters, one from Khuzestan and one from Fars); about 20 letters (some excavated at sites in Assyria and Armenia) and legal texts (from Susa); an omen text and a hemerological text (from Susa). A few Elamite passages or glosses appear in Akkadian texts from Mesopotamia. Elamite names, words, and loanwords appear in Akkadian and Sumerian legal and administrative texts from both Mesopotamia and Iran.

Thus, by the time the Achaemenid kings began to keep written records, Elamite was long established as a language of practical literacy in southern and western Iran. It was used often for royal display and commemoration, sometimes for legal and administrative recording, and occasionally even for scholarly transmission. It was the foremost vehicle by which inhabitants of ancient Iran communicated in writing.

Royal Inscriptions

Elamite versions of about 75 Achaemenid royal inscriptions include rupestrial inscriptions, architectural inscriptions displayed on building elements, commemorative inscriptions on stone, clay, gold, or silver tablets associated with

royal buildings, and inscriptions on portable objects such as ornamental knobs of Egyptian blue, stone vessels, tableware, weights, cylinder seals, and statues. Almost all are versions of texts that were also presented in Old Persian, Akkadian, and occasionally Egyptian, on the same objects or structures as the Elamite versions, or on companion objects.

Most of the inscriptions with Elamite versions were displayed or deposited at sites in the core provinces of the Achaemenid Empire, in Persia, Elam, or Media. A few were displayed elsewhere, including the Suez inscriptions set up by Darius I in Egypt (DZb, DZc; Lloyd 2007: pp. 99–107) and the rock inscription of Xerxes at the citadel of Van in eastern Anatolia (XV). Inscriptions on the statue of Darius I that was made in Egypt and displayed at Susa included Elamite versions (DSab; Yoyotte apud Perrot 2010: pp. 256–299; Vallat apud Perrot 2010: pp. 312–313), as did multilingual inscriptions on stone vessels made in Egypt and carried to many other sites (e.g. DVsc [Westenholz and Stolper 2002], XVa–d).

The evolution of the multilingual Achaemenid inscription that is discernible in the texts on the monument of Darius I at Bisutun (DB, DBa–l) began with the Elamite versions, as the spatial arrangement of the monument reveals (Schmitt 1991: pp. 18–19 with references). The first text added to the relief was a monolingual Elamite inscription giving Darius' name, ancestry, and claim to royal descent (DBa), placed in the field of the relief, centered above the image of Darius. The second text was a first edition of the fully developed apologia, including the narrative of Darius' rise to power and suppression of his opponents, and his admonitions and exhortations to future rulers and readers, presented in Elamite (DB El. §§1–54), positioned immediately to the right of the relief panel. The agents of Darius first chose Elamite to commemorate his reconquest and restoration of the core territories of the empire. The concept of the Achaemenid royal inscription evolved during the expansion and revision of the Bisutun monument to envision a document displayed in an innovative multilingual form and propagated (as the fragmentary versions of DB from Babylon and Egypt reveal) in many monolingual versions.

The nexus between the Elamite and Persian versions is close. When the versions show differences in contents or word order, the Elamite most often agrees with the Old Persian against the Akkadian. In most cases where the Elamite and Old Persian disagree in the Bisutun texts, the Elamite appears to reflect an original wording, altered in the final edition represented by the Old Persian text. In a few cases, however, the Elamite diverges in ways that are not reflected in either of the other versions.

The several versions of most other, later, multilingual inscriptions were ordinarily composed and carved simultaneously, as is again clear from their spatial arrangement on single architectural elements or foundation documents,

in symmetrical panels of architectural ornament, on stone plates and vessels, or on cylinder seals. When the versions appear on the same surface, they are normally in a ranked array. At Persepolis, when three versions of an architectural inscription are displayed side by side, the Old Persian is commonly central, the other versions on either side (e.g. DPc, XPcb, XPdb, but not DPa, DPb, XPe). When three versions are displayed in vertical array, the Old Persian is normally uppermost, the Elamite below it, and the Babylonian below that (e.g. DPh, XPda, XPcb). The same order is normal in trilingual royal inscriptions in vertical array on stone weights (e.g. Wa–Wf) and on cylinder seals (e.g. SDa–SDe, SXd); it is also found in quadrilingual inscriptions on stone vessels (adding an Egyptian hieroglyphic version below the Babylonian, e.g. DVsc, XVs, AVs) and on one face of the quadrilingual Suez stele of Darius I (DZb-c), where the Egyptian hieroglyphic counterpart is on the opposite face.

The same ranking of versions also appears in the unique suite of four distinct but interrelated foundation inscriptions of Darius I (DPd–DPg) that were laid out in non-symmetrical array and carved all at one time in side-by-side panels on a single stone block, 7.2m wide, on the south face of the terrace at Persepolis. The two Old Persian inscriptions (DPd, DPe) are at the viewer's left, the Elamite inscription (DPf) to the right of them, and the Babylonian inscription (DPg) on the far right, that is, with the left-to-right sequence corresponding to the common vertical arrangement (and also found in the mirrored horizontal arrays of DPa and DPb). Each is a distinct text, but they are rhetorically connected as a series to be read from left to right, the language of each adding nuance to its specific contents. While the two Old Persian texts, in an archaizing version of the language of the empire's rulers, focus on royal and divine protection of the Persian land and people, and the Akkadian text, in a venerable language of the larger empire, asserts the geographical scope of the realm, the Elamite inscription (DPf), in the ancient indigenous language of the region, focuses on the construction of the “fortress” at Persepolis itself (see Lincoln 2008: pp. 223 and 231–233). The arrangement of the versions reflects a social and political nuance as well as a decorative choice.

Royal inscriptions on cylinder seals begin with the pronoun “I” and state the king's name and short title as appositions. Hence, unlike inscriptions on non-royal seals, they are self-predications rather than statements of ownership. Multilingual examples, with Elamite versions, come from the reigns of Darius I and Xerxes I. Only one actual seal of this kind is extant, said to have come from lower Egypt (Schmitt 1981: p. 19 SDa; Merrillees 2005: p. 52 and pl. vii, no. 16); eight others are attested indirectly by impressions on clay tablets, bullae, and sealings from Persepolis (Schmitt 1981; Garrison 2014; seals with royal name inscriptions impressed on sealings from Daskyleion, in western Anatolia, do not have Elamite versions: Schmitt 2002).

Administrative Texts

Most Achaemenid Elamite administrative texts belong to two archives discovered at Persepolis. The 20 000–30 000 excavated tablets and fragments of the Persepolis Fortification Archive are the remains of about 15 000–18 000 original documents, about 70% of them bearing Elamite texts (Jones and Stolper 2008). About 2400 of the Elamite texts have been published; a publication of about 2500 others, widely cited in preliminary form, is forthcoming; and editions of about 1000–2000 more are in preparation (Henkelman 2013; Henkelman *infra*, with references). They are dated between 509 and 493 BCE. They record the storage and distribution of food (cereals and cereal products, beer, wine, oil, etc.) and livestock in the region around Persepolis, to support workers, administrators, religious personnel, courtiers, and others.

All but one of the 746 excavated tablets and fragments of the Persepolis Treasury Archive bear Elamite texts, 138 of them published (Azzoni et al. 2017, with references). Most are dated between 492 and 457 BCE. A few are as old as 507–505 BCE (Stolper, Henkelman, and Garrison 2020). Most deal with payments of silver from a treasury in Persepolis to workers at or near Persepolis.

A single Achaemenid Elamite administrative text believed to come from Susa closely resembles texts from the Persepolis Fortification Archive, even bearing a seal found on Persepolis Fortification tablets (Garrison 1996). The sign forms, text layout, and few preserved words on a fragmentary tablet excavated at Old Kandahar, in Afghanistan, closely resemble those of Persepolis Fortification texts (Fisher and Stolper 2015). These isolated remains of lost archives suffice to show that the use of Elamite for state administrative recording was widespread in Achaemenid Iran.

Of other known isolated Achaemenid Elamite administrative documents, some originated in the Persepolis Fortification Archive (Vallat 1994: pp. 264, 272; Jones and Stolper 2006; Henkelman et al. 2006; probably Grillot 1986). Others, of uncertain provenience, may be survivors of lost archives (Jones and Stolper 1986: pp. 247–253; Garrison, Jones, and Stolper 2018).

Like Elamite versions of Achaemenid royal inscriptions, Elamite administrative records at Persepolis were products of a multilingual environment, in two senses.

First, though dominated by Elamite documents, the archives also included texts in other languages: more than 840 monolingual Aramaic Fortification texts, as well as single Greek, Old Persian and Phrygian Fortification texts, and two in Demotic Egyptian dealing with the same or similar matters as the Elamite records; and Aramaic epigraphs, aids to document handling, on more than 250 Elamite Fortification tablets. Archive keepers had to be passively proficient with information written in several languages, and actively proficient

enough to mark their handling of Elamite records with notes written in Aramaic (Azzoni and Stolper 2015).

Second, the many transcriptions of Iranian words in Elamite administrative texts (Tavernier 2007) and the frequent calques on Old Iranian syntax reveal that the records were composed by and for speakers of Old Iranian languages and dialects; for many or most of them, Elamite was an acquired written language.

Seal Inscriptions

About 5% of the seals impressed on Persepolis administrative texts had inscriptions, about half of the monolingual seal inscriptions (more than 90) are in Elamite, and about a quarter are in Aramaic. The seal inscriptions normally give the name, and sometimes the patronym, of the seal's original owner or his superior. A few of the Elamite seal inscriptions name the current seal users, who figure in the transactions recorded on the sealed tablets; they are sometimes figures of high social status or administrative rank (e.g. the seals of Šuddayauda [Garrison and Root 2001: pp. 268–270] or Ašbazana [Garrison 1998]). In many cases, however, the seal is associated with an office, and not with an individual user, and the name in the seal inscription is not connected with the personnel of the archives. Some of the Elamite-inscribed seals may have been heirlooms (e.g. PFS 93*, inscribed with the name of Kuraš [Cyrus], son of Šešpeš [Teispes], and others, see Garrison 2011), but others were transmitted by official succession or delegation. For users of the documents, the inscriptions alone – even if legible in fragmentary impressions – cannot have been either necessary or sufficient to identify the user and confirm the validity of the sealing.

Texts on heirloom seals are presumably pre-Achaemenid and early Achaemenid. Conversely, some seals with similar inscriptions, sometimes classified as pre-Achaemenid Neo-Elamite, may also be of Achaemenid date (e.g. Amiet 1973: pl. vi–ix; Garrison 2002 [2006]).

Elamite Sources of Old Iranian

Elamite transcriptions of Old Iranian words make Achaemenid Elamite texts the largest single source of Old Iranian lexicon in indirect transmission. Spelling variations, especially in administrative documents, reflect phonological and dialect variation in the forms of Old Iranian spoken around the Achaemenid courts and its differences from the archaic Old Persian of the royal inscriptions (Henkelman 2011a: p. 614f. n. 105). Similar variations in royal inscriptions also reflect editorial or stylistic choices (e.g. *miššadanaš*

[DNa] and *mišbadanaš* [DSe], *mišbazana* [DPa], representing Persian dialect **visadana*, half-Persian **vispadana*, and non-Persian *vispazana*, “of all kinds”; Tavernier 2007: pp. 34 and 78).

Transcriptions or translations in administrative texts sometimes provide common-register nuances of words or phrases otherwise attested only in the high rhetorical register of royal inscriptions: e.g. *miššadanaš*, etc., “of all kinds,” in royal inscriptions indicating the universal scale and scope of the Achaemenid Empire, but in Fortification texts referring to varieties of poultry, grain, or flour (Henkelman 2010: p. 746f.); *pirrašam*, transcribing Old Persian *fraša-*, “wonderful,” in royal inscriptions describing the palace at Susa (DSf, DSj, DSz) and all visible creation (DNa), but in Fortification texts, naming a kind of poultry, perhaps peacock (Stolper 2015: pp. 14–21); *halpi duhema halpik*, corresponding to Old Persian *uvamaršiyuš amariyatā*, “he died in his own death” in Bisutun describing the demise of Cambyses the king, but in a Fortification text, the passing of an ordinary administrative functionary (Stolper 2015).

Transcriptions in administrative texts represent Old Iranian social, administrative, and technical vocabulary that is often not attested directly in Old Iranian scriptures or royal inscriptions but that sometimes appears transcribed in Akkadian, Aramaic, Greek, or other languages, in texts from the Achaemenid Empire’s provinces and sphere of influence: for example, Elamite *kurtaš*, Aramaic *grd*, Akkadian *gardu*, all representing Iranian **grda-*, “worker, domestic” (Tavernier 2007: p. 423f.); Elamite *partetaš*, Akkadian *pardēsu*, Greek *παράδεισος*, etc., representing Old Iranian **pardēda*, **pardēsa*, cognate with the Old Persian hapax legomenon *paradaidā-*, “enclosure” (Tavernier 2007: pp. 446–447; Boucharlat 2016: pp. 62–65, with references). The dense attestations in Elamite administrative texts provide an essential term of comparison for interpreting the sparser evidence and distinct social contexts of Achaemenid presence elsewhere.

Writers of administrative texts could sometimes choose between transcribed Iranian terms and translation with Elamite synonyms (e.g. *kandabara* and *kanzabara*, Elamite transcriptions of Persian and non-Persian dialect forms **gandabara-* and **ganzabara*, respectively, all synonymous with Elamite *kapnuški-*, “treasurer”; Tavernier 2007: p. 422) or transcriptions of Iranian compound nouns and counterpart Elamite noun phrases (e.g. noun phrases with Elamite *kutira* corresponding to compounds with Iranian *-bara*, “bearer” or with Elamite *buttira* corresponding to Iranian *-kara*; Henkelman 2011a: p. 592). Elamite morphemes attached to some words of Iranian origin mark their adoption as actual loanwords (e.g. *kurtašbe*, “workers,” representing Iranian **grda-*, with an inappropriate Iranian nominal ending *-š* generalized to mark words of Iranian origin, and an Elamite plural marker *-p*, and, in the form *kurzap*, contracted on the model of Elamite verbs; Henkelman

2011a: p. 592). The writers of these documents, whether their first spoken language was Iranian or Elamite, based analogical coinages on spoken forms in both languages.

Variation and Contact

In many passages of the royal inscriptions, the Elamite morphology or word order corresponds closely to the Old Persian, departing from what historical Elamite grammar would call for: e.g. *u Pirtiya* [*Kuraš šakri*] *Kanbuziya igiri* “I (am) Bardiya [Cyrus’ son], Cambyses’ brother” (DB Elamite i 29f.), corresponding to Old Persian *adam Br̥diya ami haya Kurauš puça Kambujiyahiā brātā* (DB OP i 39f.); *Kammadda akka makuš* (DB Elamite i 48 and passim), corresponding to Old Persian *Gaumāta haya maguš* (DP Old Persian i 44 and passim) (Reiner 1960).

These passages have long been understood as calques that arose from an underlying editorial procedure in which a text conceived and dictated in a current form of Old Iranian was rendered both in Elamite translation and in Old Persian, with occasional changes of editorial nuance between the versions. When the Achaemenid Elamite administrative documents first came under study, they were similarly understood as texts in “translation Elamite” (Cameron 1948: p. 19), implying that the editorial procedure of the royal inscriptions was mirrored in the administrative procedure of the archive keepers. The extreme form of this view was the thesis of “alloglottography” by which the Elamite texts are mechanical representations of underlying Persian texts, dictated in Persian and read out in Persian by users who neither wrote nor spoke Elamite (Gershevitch 1979, 1987; modified by Rubio 2007: pp. 33–40). Implicit in such views was the idea that around the Achaemenid courts language was a primary and exclusive identifier, that most speakers and especially most writers of Elamite, Persian, and Aramaic belonged to distinct groups, that subject Elamites wrote documents for Persian masters.

Such views have been aptly criticized on several grounds, including these:

They are inconsistent with Achaemenid Elamite grammar, especially as attested in the administrative texts: even in sentences where calques on Iranian possessive, attributive or other constructions are present, Elamite sentence order differs from the Iranian counterpart (Yakubovich 2008: 207); apparent calques on Iranian constructions found in the royal inscriptions are productive constructions in the administrative texts; transcribed and loaned Iranian words include no verbal forms, and almost no non-enclitic pronouns or prepositions; Elamite words are not given Iranian case-endings, and most transcribed Iranian words do not have grammatically meaningful case-endings; variations cannot be understood as different “translations” of similar underlying constructions (Henkelman 2011a: pp. 588–592, 617–622).

They are inconsistent with the use of written languages at Persepolis and elsewhere, where individual scribes were literate in more than one language (Tavernier 2017: pp. 353–355).

They are historically implausible: speakers (and writers) of Neo-Elamite and speakers of Iranian vernaculars were in close contact, occupying the same territories, for at least several generations before the emergence of the Achaemenid Empire (Henkelman 2011a: pp. 594–595).

Achaemenid Elamite, as these critics cogently argue, is not an encoding of Old Iranian but a development of older Elamite affected by long contact with Iranian vernaculars, leading to a partial restructuring of the grammatical system. The restructuring favored formal similarity between Elamite and Iranian expression, modifying or creating Elamite constructions that paralleled Iranian word-order, morphology, and semantic distinctions (Yakubovich 2008: p. 207; Henkelman 2011a: pp. 588, 593, 594).

Grammatical and lexical variations indicate that most, but perhaps not all, writers of Achaemenid Elamite were native speakers of Iranian vernaculars who acquired Elamite as a second, written language and, for most, as a spoken language. Thus, the syntax of the Elamite administrative texts reflects a range of variation between extremes of preference for older Elamite grammatical constructions and for constructions that mimic Old Iranian syntax or morphology. Like the use of Elamite month names instead of transcribed Iranian month names (Hallock 1969: pp. 74–75), and use of Elamite synonyms for Iranian words, some of these choices were geographically conditioned. The Elamite options appear mostly in texts written to the northwest of Persepolis, along the route to Susa, suggesting the survival of Elamite as a native language, or at least the survival of proficiency in historical Elamite grammar and resistance to Iranian-influenced restructuring, in the region of later Elymais and the territories of the Ouxioi (Henkelman 2011a: p. 586, 2011b: pp. 8–11).

Comparable but less wide variation is discernible in the Elamite royal inscriptions. For example, in rendering the common royal title “king of kings,” inscriptions of Darius and Xerxes from Susa exhibit a strong (but not exclusive) preference for a historical Elamite possessive-attributive construction (*sunkir sunkip(ir)ra*, e.g. DSc, DSd, DSi, DSz, but not DSe) while inscriptions of the same kings from Persepolis and nearby exhibit a strong (but not exclusive) preference for another Elamite construction (*sunkir sunkip(in)na*, e.g. DPa, DPf, DPh, XPa, XPb, XPc, but not DNa) that corresponds more closely to the order and morphology of the Old Persian counterpart (*xšāyaθiya xšāyaθiyānām*).

A few passages in royal inscriptions imply an audience to whom the interplay of languages was meaningful. To appreciate the nuance and coherence of

the suite of Persepolis Foundation inscriptions DPd-DPg, for example, the ancient observer or his guide had to be literate in all the versions. Again, when Darius and Xerxes quoted the anticipated thoughts of the readers of Elamite versions, the thoughts were rendered once as transcribed Persian (*dayawišmi tarma ašdu* [representing *dahyāušmai duruvā *astu*] “my land, be safe,” DB Elamite iii 65), once translated into Elamite (*appa hamak dayawiš hube appa Dariyamawiš sunkir marrišda* “how made(?) (are) those lands that king Darius held,” DNa Elamite 33f.), and once partially transcribed and partially paraphrased in Elamite (*šada hanu* [representing Persian *šiyāta ahani*] *katukda* “‘may I be happy’ (while) you live” XPh Elamite 39). Darius and Xerxes expected the audience for their words not only to read and hear but also to think in Persian and Elamite together.

CHAPTER 8

Babylonian Sources

Michael Jursa

Introduction

Thousands of cuneiform texts dating to the 200 years of Persian rule over Babylonia are housed in various museum collections. Excluding from consideration Achaemenid royal inscriptions written in Babylonian, the corpus can be usefully divided into archival documents and library texts. The former include legal documents, administrative notes, letters, lists, and similar text types. They necessarily have to be studied within the context of the archive to which they belong. The most important criterion for judging the nature of an archive is the presence, or absence, of title deeds for real estate and other document types of long-lasting value. A group that does not contain such texts is likely to be an “inactive” or “dead” archive, i.e. a group that has been discarded or set aside for being of no further use to its owners: a fact that obviously has a bearing on the historical interpretation of the tablets. The blanket term “library texts” includes literary compositions, texts of religious or magical contents, school texts, and “scientific” material such as divinatory compendia, lexical lists, or medical compositions (for the distinction between archives and libraries, see, for example, Pedersén 1998: pp. 1–9 and 2005: p. 10). The large number of texts from the period notwithstanding, the main find spots are few. They are surveyed here in geographical order, moving roughly from north to south. (Unreferenced information can be traced back

to Jursa 2005b, a comprehensive listing of the then known archives, with descriptions of their contents and bibliography.)

The chronological distribution of the material is uneven. The conquest of Babylonia by Cyrus in 539 BCE left nearly no trace in the nature of the documentary record; archives continue, tablet formats and tablet contents remain unchanged (e.g. Jursa 2007). For practical reasons distinctions can be made between the period of the Teispids, Cyrus, and Cambyses, and the reign of Darius I. This division does not imply fundamental differences in the nature of the sources but rather in the way they reflect Persian rule over Babylonia. On the other hand, the revolts against Xerxes in the second year of his reign (484 BCE) are a major watershed:¹ with very few exceptions, the large archives of northern and central Babylonia that constitute the rich source material for the “Long Sixth Century” that began with the rise of the Neo-Babylonian state at the end of the seventh century BCE come to an end. For the subsequent 150 years of Babylonian history under the Persians we have only above a quarter of the sources that are available for the first 50 years of this period. The archives that end in 484 BCE include two huge temple archives that span the entire sixth century as well as numerous archives of priestly families and Babylonian businessmen who had connections to the institutions of local (i.e. Babylonian) government. Southern archives and archives of Babylonian families who had close dealings with the royal administration or who at least were lacking the problematic links to the priestly class and the Babylonian city elites continued (Waerzeggers 2003/2004: pp. 158–160): the fate of an archive around 484 BCE is thus also a shibboleth for the socioeconomic placement of the archive holder(s). (In the following survey of the documentation, we use the label “Neo-Babylonian” for texts dating to the period of the Neo-Babylonian Empire, “Early Achaemenid” for Persian period texts up to the second year of Xerxes [even though “Teispid and early Achaemenid” would be more precise], and “Late Achaemenid” for all later tablets of the Persian period.)

Survey of Archival Texts

Sippar

Excavations in this northern Babylonian city yielded several private archives that are relevant in the present context, but most important of all, they brought to light the largest Neo-Babylonian archive of all, the archive of Ebabbar, the Sipparean temple of the Sun god (Jursa 2005b: pp. 116–133). The main temple archive extends from the mid-reign of Nebuchadnezzar to the second year of Xerxes: it comes to an end after the defeat of the Babylonian rebellions against Persian rule. The known part of the archive contains some 2500 tablets from the

Persian period; many more are hitherto unpublished. During the first decades of Persian rule, all aspects of Ebabbar's administration are reflected in the archive, but from the third decade of Darius' reign onward the distribution of the text types shifts toward more ephemeral groups: this is an inactive archive that was deposited in a storeroom after the removal of current files, title deeds, and other texts of immediate or lasting concern. Several private archives, mostly of priestly families, follow the Ebabbar archive's chronology and come to an end in 484 BCE. Foremost, one should mention the Šāhīt-ginê A archive (c. 200 tablets) of a family of priests and entrepreneurs who made a career in Sippar after moving to the city from Babylon (Waerzeggers 2014), the Šangû-Šamaš A archive, which belonged to priests who also worked as exorcists and kept a library of medical and magical material in their house (184 economic tablets and 88 medical tablets), and a small group of less than 30 texts that deal with the business of several branches of the Ša-nāšišu family, a clan that held high temple and provincial offices in Sippar and Babylon before the rebellions (Waerzeggers 2003/2004: p. 159; Jursa 2007: pp. 76–77). Recently, an archive of a merchant engaged in long-distance trade with Iran was published (Pirngruber 2020).

Babylon

For Babylon, we have to distinguish between tablets coming from illicit excavations, now housed overwhelmingly in the British Museum (and discussed first), and the finds of the German excavations, which are now in Berlin and Istanbul, at least to the extent that they have survived the vicissitudes of World War I and its aftermath (Jursa 2005b: pp. 60–76; Pedersén 2005).

In the unexcavated material, the Early Achaemenid period is represented by a number of private archives that all break off in the second year of Xerxes. The most important is the Egibi archive, which belonged to a family of businessmen who had aligned themselves during the early Persian period with the city governor of Babylon and his establishment (Abraham 2004; Waerzeggers 2003/2004: p. 159). Some 700 tablets of the archive date to the Persian period. The archive was deposited in several clay jars after the removal of title deeds and other texts of relevance for the last archive holders. Other family archives falling in this “end-of-archives” pattern include the Ea-eppēš-ilī A (60 tablets; priests, Baker 2008: p. 107; see also below), Nappāhu (291 tablets; priests), and Šangû-Ninurta (90 tablets; landowners) archives. Other archives from Babylon that include Early Persian period texts but end earlier than the second year of Xerxes are either small (such as the Rabâ-ša-Ninurta archive; landowners) or date mostly to the Neo-Babylonian period (such as the Sîn-ilī archive, which, as excavations in Babylon have revealed, was deposited in the Ninurta temple of the city during the reign of Darius, see below).

After 484 BCE, the number of texts from Babylon plummets. There is one lot of tablets mostly from the fourth century that can be associated with the Esangila and that extends chronologically into the early third century (Clancier 2009: p. 198): about 200 texts, mostly ration lists, document the administration of the temple of Marduk in this period (Jursa 2005b: pp. 73–75; Hackl 2021 presents numerous unpublished texts). Otherwise, recognizable Late Achaemenid archives from Babylon in the British Museum collections are rare: 10 tablets belong to the well-to-do landowner and “architect” Bēl-ittannu (second half of the fifth century BCE), eight tablets are associated with the landowner Dahhū’a, son of Arad-Bāba, and another small group, four tablets, to a boat owner and businessman by the name of Nidintu (reign of Xerxes and Artaxerxes I).

The German excavations at Babylon brought to light a considerable number of Neo- and Late Babylonian tablet groups (Pedersén 2005: pp. 110–296; Clancier 2009: pp. 147–49). A majority of the tablets date to the period of the Neo-Babylonian Empire. The most remarkable group among the archives of relevance for Persian period texts is the archive of the governor Bēlšunu, whose originally nearly 1000 tablets (not all are preserved) mostly date to the reigns of Artaxerxes I, Darius II, and Artaxerxes II but also contain a small number of texts from the reign of Nebuchadnezzar and Darius I (Pedersén 2005: p. 146; Jursa 2005b: p. 61). With this exception, no clearly-definable archive straddles both sides of the caesura of 484 BCE, and the Late Achaemenid (i.e. post 484) excavated material is objectively “rather scarce” (Baker 2008: p. 107), while the texts dated to the reign of Darius I dominate the documentation from the Persian period, as in the case of the material in London. Apart from the Bēlšunu archive, there are no Achaemenid period texts from the Kasr area of Babylon. The two private business archives from the Merkes area that date to the Achaemenid period come to an end, on the basis of the available information, in the first or second year of Xerxes’ reign, thereby repeating the pattern well known from the material from illicit excavations (Baker 2008: pp. 105–107; Oelsner 2007: p. 292¹ and 303): viz., the archive of Nabû-ittannu (20 tablets) and the largest and actually only well-defined Early Achaemenid archive from the German excavations,² the archive of Iddin-Nabû of the Egibi family (163 tablets). As is typical for the “end-of-archives” groups, this is an inactive business archive lacking in title deeds (Pedersén 2005: pp. 208–217). From the Homera area comes a group that belongs to the Ea-cppēš-ilī A archive, which is otherwise known from unprovenanced tablets mostly in the British Museum. This archive ends in 484 BCE (Baker 2008: p. 107). From the Ninurta temple in the Išin Aswad part of the mound there comes the Šin-ilī archive (Pedersén 2005: pp. 228–247; Jursa 2005b: pp. 69–71), a business and family archive of more than 500 tablets (of which some 160 were found by illicit excavators and sold on the antiquities

market) that was deposited in the temple after the removal of current files for an unknown reason. The archive spans the time between 599 and the eighteenth year of Darius I (504 BCE – but the bulk of the material is Neo-Babylonian); a small group (12 tablets) of Late Achaemenid texts from the Ninurta temple has no apparent connection with the larger archive (Pedersén 2005: p. 231). Tablet finds in the private houses northeast of the Ninurta temple (the archeological context is unclear) include several badly-defined groups of archival tablets and library texts which, as far as they are dated, mostly come from the Neo-Babylonian period, with smaller numbers of early Achaemenid texts (down to the reign of Darius I); late Achaemenid material is present, but rare, and unconnected with the earlier finds. The only recognizable archive is that of members of the Rab-banê family of close to 100 business documents, most of which are Neo-Babylonian (the latest known text dates to the third year of Darius I; Pedersén 2005: p. 252); there is also an uncertain number of library texts. From the Amran section of Babylon come several badly-defined groups of archival texts, including Late Achaemenid and Hellenistic texts, as well as some literary tablets. The Esangila temple, which is situated in this area but was barely excavated, yielded only eight tablets, of which only one is dated (to the reign of Cambyses). From the Sahn area (where the temple tower, Etemenanki, was situated), assorted Neo-Babylonian and early Achaemenid material was recovered, but no later texts.

Borsippa

This city yielded a rich crop of private archives and remnants of the temple archive of Ezida, the main temple of the city. This material, housed primarily in the British Museum, dates predominantly to the early Achaemenid period. Of the more than 1850 tablets, many are still unpublished (Waerzeggers 2010).³ Some of these archives are large: the Rēʾi-alpi archive contains more than 400 tablets, the Ilia A archive over 250, and the Ea-ilūtu-bani group around 325. Most of the archive-holding families were of priestly origin, and the texts refer to their involvement in the cult and the management of their estates. The archives are also by far the best source we have on early Achaemenid taxation. The priestly archives and the Ezida texts, in particular the *iškaru* file, come to an end in 484 BCE and display the pattern typical of “end-of-archives” groups: property documents and the like of the last generation are missing (Waerzeggers 2003/2004: p. 156). The only significant archive that straddles the dividing line of 484 BCE is the Tattannu archive (Jursa and Stolper 2007). This archive, whose chronological range is unusually long, from the late sixth to the early fourth century, consists of the business documents of an extraordinarily rich family of landowners who seem to have had contacts to the crown and who in addition to exploiting their holdings engaged in various

entrepreneurial activities. The Tattannus are an example of a stratum of Babylonian society that was not affected by the events of 484 BCE. Otherwise Late Achaemenid texts from Borsippa are rare; very few archives can be identified. A small group of Ezida tablets from the reign of Artaxerxes III deserves mention as they are indirectly connected with a similar such group dating later in the Hellenistic period. Also they constitute evidence for the changes in the administration of the Ezida temple that had occurred after the late fifth century BCE (Waerzeggers 2010: p. 10; there is additional material on Ezida from other archives).

Cutha

This northern Babylonian city is one of the few find spots that have not produced important documentation from the Early Achaemenid period but have produced Late Achaemenid material: several small private archives of well-to-do Cuthean families from this period are housed in the British Museum. One group also contains retroacts dating back to the reign of Darius I. The texts are mostly relevant for the light they shed on the urban structure of the city, the price levels of the periods, and the indications regarding the continuing importance of the Emeslam, the chief temple of the Cutha (Jursa 2005b: pp. 97–98).

Kiš/Hursagkalama

Excavations have yielded several small archives, both private and institutional (Jursa 2005b: pp. 102–107). Three private groups date to the Early Achaemenid period: the archive of the sons of Nabû-ušallim (ending in 484 BCE) and the Eppēš-ilī and Rē'i-alpi archives. Late Achaemenid groups include the archive of a slave engaged in various types of business (Bēl-ana-mēreḥti), the archive of an entrepreneur working mostly in the area of agriculture (Mušallim-Bēl), and a group of tablets associated with the property of a high royal official (*rab umma*) of Babylonian origin (Lâbâši). Finally, there is a group of texts associated with the administration of the main temple of Kiš, the Edubba. The bulk of the material consists of ration lists that date to the reign of an Artaxerxes, hence the late fifth or to the fourth century BCE. This group is interesting for the close formal parallels to the contemporary Esangila archive from Babylon.

Isin

Only a small group of tablets dating to the reign of Darius I is of relevance here. These texts document the management of royal estates by a Babylonian businessman (Jursa 2005b: p. 102).

Kissik

From this city in the far south come several (unpublished) contracts, school texts, and administrative documents from a Ningal temple. The extant dated material stems from the reign of Darius I (Jursa 2005b: p. 102).

Dilbat

This important city on the Euphrates yielded one archive belonging to the “end-of-archives” group. It belonged to the Dābibī, a family of priests and temple officials employed in the E-imbi-Anu, the main temple of the city. The texts include some property documents of the family’s core archive as well as records having a bearing on the administration of the E-imbi-Anu temple during the reign of Darius I (Jursa 2005b: pp. 98–99). Some Late Achaemenid texts that were written in Dilbat are known, but they do not form a coherent group (Stolper 1992).

Nippur

The textual record from this central town (Jursa 2005b: pp. 110–116) in central Babylonia has played an important role in the history of research on Achaemenid Babylonia owing to the presence of the Murašû archive, probably the single most important source of information on late fifth-century BCE Babylonia, and certainly the best studied (Stolper 1985; Donbaz and Stolper 1997). Yet the site cannot serve as a paradigm for all of Babylonia owing to the isolated position of the city and to its – relatively speaking – economic “backwardness” during much of the first millennium BCE (Jursa 2010: pp. 405–418).

The tablet groups from Nippur include a fragmentary archive associated with the main temple of the city, Ekur. The archive can be divided into a Late Achaemenid group from the late fifth and the early fourth century and an early group that extends from the late reign of Nebuchadnezzar to the late reign of Darius I and may well belong to the “end-of-archives” category even though material dating to the period of the rebellions is still missing. Early Achaemenid private groups include the archive of Bēl-eṭēri-Šamaš, an entrepreneur who did business with the Neo-Babylonian and the Persian administrations (the archive comes to an end in the first year of Cambyses; Jursa 2005a), and a small dossier of business texts originating in the milieu of Carian mercenaries who had been settled in the hinterland of Nippur. The Late Achaemenid period is represented by two private archives: the Murašû archive and the Absummu archive. The latter is a group of more than 50 tablets documenting the activities of the archive holders as temple scribes, administrators, exorcists, and priests working in the Ekur temple. The chronological range

extends from the end of the reign of Artaxerxes I to the end of the reign of Artaxerxes II. The Murašû archive of more than 700 tablets, ranging from the tenth year of Artaxerxes I to the first year of Artaxerxes II, is a business archive of a family of entrepreneurs who specialized in agricultural management, working in the hinterland of Nippur in an area that was dotted with the holdings of collectives of soldiers (often of foreign extraction) and large domains of Persian nobles. The archive is an extremely rich source of information on Achaemenid period land tenure and generally on the economic history of the period, as well as on tax and service obligations and the organization of the Babylonian component of the Persian army.

Ur

The documentation from this ancient southern city includes several small archives of the Achaemenid period (Jursa 2005b: pp. 133–138): the file of Nidinti-Ea (Late Achaemenid), the Imbia archive (reign of Darius I), and most importantly the Gallābu archive. This is a group of more than 50 tablets with an extraordinarily long chronological spread: seven generations of the archive-holding family are attested, the texts date from the 29th year of Nebuchadnezzar II to the fourth year of Darius III and thus to the very end of the Achaemenid period. The tablets deal with the management of the not very extensive properties of the family (Popova 2018).

Uruk

At two junctures, the documentation from Uruk (Jursa 2005b: pp. 138–149) reflects the far-ranging consequences of the Persian government's interventions in the affairs of a provincial city and in the textual record left by local institutions and local families. The largest archive from Uruk is that of the Eanna temple (c. 8000 published and unpublished tablets and many more unpublished fragments). The chronological range is similar to that of the Ebabbar archive: it starts in the late seventh century and ends toward the end of the reign of Darius I (the latest known text dates to the twenty-ninth year of this king). However, the revolts against Darius at the beginning of his reign and a reorganization of the temple administration in the king's second year mark an important juncture: the main temple archive that was recovered by controlled excavations and by illicit diggers breaks off in this year; there is only a handful of tablets from Darius' later years (van Driel 1998; Frahm and Jursa 2011: pp. 24–29). In the aftermath of the rebellion against Xerxes, reprisals targeted those leading families of the city who had come from Babylon. The northerners were removed from their offices, the importance of the northern Babylonian gods Marduk and Nabû in the local cult was drastically reduced, and the local god Anu was promoted to chief deity in Uruk. The Urukian

priesthood transferred their offices from Eanna to the Anu temple which experienced a steep ascendancy at the time while the old Eanna temple was allowed to fall into ruin (Kessler 2004: pp. 250–251; Kose 1998: pp. 9–16).⁴ The Early Achaemenid private archives of priests (belonging to northern clans) that were excavated in private houses in the vicinity of the Eanna temple and archives that were found intermingled with the Eanna temple archive follow this “end-of-archives” pattern: there is no Late Achaemenid material; 484 BCE is a major watershed also in this case. The most important of these archives is the Egibi archive (the Egibis were a northern family) of some 200 tablets, of which none postdates the thirty-third year of Darius I. In contrast, there is at least one archive of a local priestly family that was excavated in another part of the site (U 18) and that spans the juncture of 484 BCE: the Gimil-Nanāya B archive. Other U 18 groups are Late Achaemenid: note the contracts of the Ekur-zākir family from the reign of Darius III and the early Seleucid area that belong with the large library of literary texts associated with the family. Overall Late Achaemenid material from Uruk is scarce (also in contrast to Seleucid material) even though there are a number of stray tablets that cannot be assigned to well-defined archives (Stolper 1990; Hackl 2017).

Larsa

This minor town in the vicinity of Uruk has left one archive of a family of businessmen that stretches from the middle of the reign of Nebuchadnezzar to the second year of Cambyses: the archive of the sons of Itti-Šamaš-balātu (Jursa 2005b: pp. 108–109). The archive is interesting for the continuity of business and also of tax and service obligations that are not visibly affected by the conquest of Babylonia by the Persians. There is some dispersed Late Achaemenid material (Stolper 1990) and one small dossier that extends from the end of the Achaemenid period to the early Hellenistic era (Jursa 2005b: pp. 109–110; more texts have been located in a private collection and will be published in the near future).

Varia

A group of texts documenting the economic and social life of communities of deported Judeans who were settled in southern Babylonia, probably between Nippur and Uruk, came to light in the 1990s on the antiquities’ market (Peirce and Wunsch 2014). This group contains a few Neo-Babylonian texts (dating as far back as the reign of Nebuchadnezzar), but the bulk of the material dates to the reigns of Cyrus, Cambyses, and Darius I. With the accession of Xerxes, the number of tablets decreases rapidly, but a few texts do postdate 484 BCE. The archive documents the management of the fields assigned to the deportees, their tax and service obligations vis-à-vis the royal administration, and aspects of the private business of some of the more affluent of these Judean families.

A small Late Achaemenid archive (seven tablets dating to the late fifth and the early fourth centuries BCE) documents the affairs of a family of landholding priests living in the village or small city of Šaṭir between Uruk and Nippur (Jursa 2005b: pp. 150–151).

Library Texts

The Late Babylonian library texts are an important testament of the vigor of Babylonian cultural life under foreign occupation. However, they have not yet been analyzed comprehensively as a group. Library texts are normally undated. If, as happens frequently, colophons naming identifiable scribes, a meaningful archeological context, or a connection with dated archival texts are also missing, dating depends on the evaluation of epigraphy and tablet formats. Owing to a lack of pertinent research, it is currently possible only to distinguish a broad category of ‘late’ texts dating roughly to the late fifth through second centuries from tablets originating in the late seventh, the sixth, and perhaps also the early fifth centuries: distinguishing Late Achaemenid from Seleucid period literary tablets is often impossible. With this general uncertainty in mind, the following major “libraries” can be assigned roughly to the Achaemenid period.

From Uruk comes the library of the Eanna temple, 400-plus texts and fragments, having a chronological range (on the basis of archeological context and accompanying administrative texts) from the Neo-Babylonian period to the second year of Xerxes (Pedersén 1998: p. 206; Clancier 2009: pp. 34–35; other, later temple libraries from Uruk include no, or nearly no, Late Achaemenid material and date exclusively to the Seleucid period). Two libraries of families of exorcists have been recovered in a private house, one dating to roughly 445–385 BCE, the other from the second half of the fourth to the end of the third century (Clancier 2009: pp. 58–61). The texts include predominantly magical, medical, and divinatory material, as well as school texts and some mathematical compositions (Clancier 2009: pp. 81–82).

From Babylon, we have a large group of literary texts of all descriptions that can be associated with the Esangila temple. The texts include a vast group of astronomical texts, perhaps as many as 3000 (see, e.g., Ossendrijver 2012), as well as divinatory, magical, and some medical material, other learned compositions, viz., mathematical and lexical texts, commentaries and school texts, and finally a few historical and historical-literary compositions (Clancier 2009: pp. 205–212). The chronological distribution of the dateable astronomical material suggests, however, that the bulk of this library is post-Achaemenid (Clancier 2009: pp. 309–311). Among the astronomical texts, the Astronomical Diaries deserve special notice. These mostly post-Achaemenid texts are records of astronomical observations accompanied by price data, information on the water level of the Euphrates, and occasional notes on remarkable incidents of political, economic, or social nature and/or of ominous portent (e.g. Pirngruber 2012).

The excavated material from Babylon (Pedersén 2005) consists predominantly of archival texts, as detailed above, but some literary material was recovered too (Clancier 2009: pp. 147–149). According to the information given by Pedersén, this material is mostly Neo-Babylonian or in any case predates the reign of Xerxes (see also Baker 2008). This is true for finds on the Kasr (Pedersén 2005: pp. 185–186) and on Išin Aswad (ibid. 247–272), as well as for the “libraries” found in the Ištar temple (ibid. 188–192) and in the Ninurta temple (ibid. 232⁵). Numerous hitherto unpublished tablets without a clear archeological and archival context cannot be dated.

In the Ebabbar temple in Sippar, a large collection of literary and scholarly tablets was recovered by Iraqi excavators in the 1980s (Pedersén 1998: pp. 194–197). The library contains omen collections, prayers, incantations, and hymns, as well as copies of some of the most important myths and epics of Mesopotamian literature. Several scribes mentioned in the colophons of these texts can be identified with priests known from the administrative Ebabbar archive (Fadhil and Hilgert 2008; Schaudig 2009); the library is thus to be dated to the (later) Neo-Babylonian and Early Achaemenid period, 484 BCE being the *terminus ante* or *ad quem* for its deposition.

Conclusions

The total number of texts that can be dated to the Persian period cannot be established definitively owing to uncertainties of the dating of damaged tablets or of texts that can be assigned only a rough date on the basis of prosopographic, diplomatic, or epigraphic evidence. Rough approximations for the material known to us are as follows (unread tablets that are simply listed with their dates in the catalogues of the British Museum and in Pedersén 2005 have not been included):

Sippar	reigns of Cyrus and Cambyses: c. 1200 tablets reign of Darius I until the second year of Xerxes: c. 1400 tablets
Borsippa	reigns of Cyrus and Cambyses: c. 450 tablets reign of Darius I until the second year of Xerxes: c. 1400 tablets
Babylon, Kiš, Nippur, Dilbat	reigns of Cyrus and Cambyses: c. 600 tablets reign of Darius I until the second year of Xerxes: c. 1200 tablets
Uruk	reigns of Cyrus and Cambyses: c. 800 reign of Darius I until the second year of Xerxes: c. 90
Total	Cyrus and Cambyses: 3050; Darius I (including the first years of Xerxes): 4090

Structurally, these texts are no different from those of the preceding Neo-Babylonian period; most of the larger archives straddle the year of conquest, 539 BCE. There was not fundamental change at this juncture. What internal developments can be seen are gradual, not abrupt. The social groups to which the archive holders belong include many priests as well as entrepreneurs and traders of various degrees of prosperity (archive-holding craftsmen and subsistence farmers are attested but rare); and there are of course the huge archives of the Eanna and Ebabbar temples. The contents of the tablets include household and property management and various types of business (agricultural matters, local and long-distance trading, tax and income farming, manufacturing, financial transactions ranging from small-scale money-lending to ambitious investments in business companies; Jursa 2010). Apart from occasional references to the Great King (always a distant and shadowy figure), to members of the royal family and their personnel, and to Persian officials (e.g. Tavernier 2007), Persian rule is reflected most clearly in the documentation for tax and service obligations, where one hears, for example, about the construction of several royal palaces, the building program of Darius in Susa, and the construction of a canal (the Kabar canal) that was to link southern Babylonia with the Susa region (see Chapter 67 Taxes and Tribute and Tolini 2011).

From later periods, we have fewer than 100 tablets dating to the reign of Xerxes from all of Babylonia (after 484 BCE). From the rest of the fifth century (reigns of Artaxerxes I and Darius II), there are perhaps as many as 1500 tablets (it is not always possible to assign isolated texts dated to the reign of an Artaxerxes to one of the three kings of that name). The most important find spots are Babylon, Borsippa, Cutha, Kiš, and Nippur; tablets from the south (Ur, Uruk, Larsa) are far less numerous. In the fourth century, there is a further decrease in tablet numbers: perhaps around 400 tablets can be dated to this period (on the assumption that the bulk of the Artaxerxes tablets of the Esangila archive dates to Artaxerxes II or III). Only a handful of tablets dates to the reign of Darius III. The most important fourth-century find spot is Babylon; also Kiš and Borsippa in the north and Ur in the south yielded some coherent groups. Notable tablet groups, apart from the Esangila archive, include the highly anomalous Murašû archive from Nippur and the Bēlšunu and Tattannu archives. While the former is the archive of a family of Babylonian businessmen active within the sphere of state-sponsored agriculture and tax farming, i.e. in an area of the economy that is documented, albeit in a different form, also in the early Achaemenid period, the latter two archives belonged to extraordinarily rich Babylonian families with close ties to the Achaemenid government, and, in one case at least, with a tradition of holding high offices: this stratum of Babylonian society is not well represented in the earlier period. The comparatively small number of sources notwithstanding, much is known about

the institutions of Achaemenid rule over Babylonia during the Late Achaemenid period because of this particular socioeconomic setting of the material.

NOTES

- 1 The interpretation of the events of 484 BCE and the “end-of-archives” phenomenon have been widely discussed (bibliographical references in Henkelman et al. 2011: pp. 452–453), but the material basis of the evidence as presented by the key studies of Waerzeggers 2003/2004 (with Oelsner 2007) and Kessler 2004 remains firm. Some of the recent statements on the subject underrate the incisiveness of the institutional changes that occurred in or after 484 BCE. See now Waerzeggers and Seire 2018.
- 2 In the sense that the bulk of the tablets dates to the Early Achaemenid period. There are a few other groups that include Early Achaemenid tablets, but the majority of the texts of these archives are Neo-Babylonian.
- 3 Also the tablets found by the Austrian expedition to Borsippa remain unpublished.
- 4 A temple northeast of Eanna was destroyed by fire and not restored at this time (a text dated to the reign of Darius gives a *terminus post quem* for the destruction): Kose (1998: p. 10) and Lenzen (1958: p. 15 note 24).
- 5 On the assumption that the library texts are contemporaneous with the Šin-ilī archive that was found with it. They might conceivably also belong with the small group of Late Achaemenid tablets excavated in the temple (Pedersén 2005: p. 231): only publication and epigraphic study can tell.

CHAPTER 9

Aramaic Sources

Holger Gzella

Achaemenid Official Aramaic

When the Achaemenid authorities promoted an Aramaic dialect to the official administrative idiom of their vast and highly heterogeneous empire, this was a sensible if not an obvious choice. Aramaic had spread continuously throughout the Fertile Crescent soon after its appearance in writing in tenth- to ninth-century BCE Syria (though it presumably acted as a vernacular even before that time) and subsequently gained much ground in the administration of the Neo-Assyrian and the Neo-Babylonian empires. As a consequence, it was widely understood, especially among scribes and officials, formed part of an entrenched institutional framework that provided a considerable degree of professional training, and had already developed a suitably broad technical terminology as well as a sufficient number of established literary forms for letters, contracts, and economic documents current in east and west. An eighth-century inscription from Bukān (KAI 320; Sokoloff 1999) points to an early presence of Aramaic in Iran, and the Adon letter (TAD A1.1) demonstrates that this language was known at least in some places in Egypt toward the end of the seventh century BCE at the latest. So when the Achaemenid dynasty rose to power and felt the necessity for an efficient medium of international communication by which the king's wish could manifest itself between Egypt and present-day Afghanistan, it did not have to reinvent the wheel.

The driving forces underlying the increasing popularity of Aramaic in the Near East early in the first millennium BCE, at the expense of Akkadian, still defy explanation. Nonetheless, the amount of linguistic diversity in the Aramaic witnesses of the seventh and sixth centuries BCE (Hug 1993; additions in Gzella 2015: pp. 112–119), after a period of coexistence of several reasonably standardized written forms of Aramaic in Syria (Gzella 2014, 2015: pp. 53–103), suggests a fairly low degree of conscious language policy and rather points to the role of highly mobile speakers, such as merchants and craftsmen, as a crucial factor for its success. Other reasons that have been suggested by scholars, but are hard to verify, include the practical advantages of the alphabetic script with its relatively small inventory of letter signs as opposed to syllabic cuneiform with which Akkadian was written; the adaptability of the language itself, thanks to its light and versatile grammatical core; and the relatively neutral ideological connotations of an idiom that was not the native tongue of the Assyrian conquerors. Aramaic would, at any rate, have facilitated access to the structurally similar languages of Syria-Palestina, which employed the same alphabetic writing system (see the overview in Gzella 2015: pp. 104–156). Linguistic similarity is known to foster trade and migration.

Achaemenid Aramaic (Gzella 2015: pp. 157–211), by contrast, bears the characteristic marks of an imperial chancery: script, spelling, morphology, syntax, lexicon, and idiom are much more unified than in the immediately preceding stage, presumably as a result of a large-scale administrative reorganization and unification under Darius I and Xerxes (Briant 2002: pp. 507–511). Hence, it constitutes a proper variety of Aramaic, to be distinguished on linguistic grounds both from the “Old Aramaic” material of the tenth to eighth centuries and from several other forms of Aramaic used during the seventh and sixth centuries. Yet inconsistent scholarly terminology obscures the linguistic boundaries: “Imperial Aramaic,” calqued after German *Reichsaramäisch*, originally referred to Achaemenid Aramaic but is now also often applied to Aramaic from the eighth century BCE on, and the same is true for “Official Aramaic.” So for clarity’s sake, the slightly cumbersome label “Achaemenid Official Aramaic” will be used here in order to avoid confusion with the Aramaic varieties current under Neo-Assyrian and Neo-Babylonian rule (cf. Gzella 2015: pp. 104–106, 157–159).

The prehistory of Achaemenid Official Aramaic remains mysterious, largely owing to the scanty amount of textual material immediately preceding the Achaemenid period, but a case can be made for the view that it is based on a subsequently deregionalized, otherwise unknown, local Aramaic dialect of Babylonia (Gzella 2008: pp. 96–100). One may assume that the bewilderingly complex dialect landscape of south and central Babylonia in Late Antiquity (cf. Khan 2007) has roots in a much older period; a rigorous large-scale reconstruction of the language situation in ancient Babylonia in light of medieval

and modern Aramaic material could perhaps shed further light on the origins of Achaemenid Official Aramaic. For the time being, one can point to a number of linguistic hallmarks that distinguish the Achaemenid chancery language from older Aramaic varieties (Gzella 2008: pp. 91–97; 2015: pp. 168–182). The most important of these include the very frequent spelling of long (“geminate”) consonants /CC/ with *nC* (e.g. *’nt* for /’attā/ ‘you’ instead of *’t*, as in older Aramaic), which points to a nasalized pronunciation of such consonants in the vernacular originally underlying Achaemenid Official Aramaic (e.g. [’ātā]) but seems to have been a purely orthographical device in the latter (because it targets sounds that are unlikely to be affected by nasalization, such as the voiced velar or uvular fricative written with the letter signs *q* or *ḡ*); a construction based on the passive participle with the agent expressed by a preposition, presumably calqued on Old Persian though still rarely attested in first-millennium BCE Aramaic (e.g. *šmy’ ly /šamī’ lī*/ “it was heard by me” for “I have heard”); the replacement of third-person plural suffixes marking a pronominal direct object with transitive verbs by independent pronouns (e.g. *l’ ytyt hmw* “I did not bring them”); and, perhaps, a merger of the third-person plural masculine and feminine forms in the “perfect” conjugation (e.g. *ktbw/katubū*/ “they wrote” with a feminine subject; however, proper forms of the third-person feminine plural, as in many other older Semitic languages, are only attested in post-Achaemenid Aramaic, so the diagnostic value of this feature remains unclear).

Since Aramaic had already been in use in many regions that were subsequently incorporated as provinces into the Persian Empire, the standard determined by the Achaemenid chancery interacted with local dialects and scribal practice. A certain degree of variation (mostly related to spelling) in the corpus shows that Achaemenid Official Aramaic, while being essentially uniform, was to some extent affected by local dialects and competing earlier written traditions of Aramaic. Nonetheless, it soon came to dominate scribal culture and eclipsed much of the diversity that the uncontrolled spread of Aramaic in the preceding period had brought about. A comparison between the letters in the archive of Aršama (or Arsames), the Persian satrap of Egypt (TAD A6.3–16), and the private letters on papyrus discovered at Hermopolis (TAD A2.1–7) provide a case in point. Whereas the former reflect Achaemenid Official Aramaic in its purest form, the latter are clearly composed in a distinct regional variety of Aramaic and contain a number of non-standard phonetic spellings as well as morphological and syntactic peculiarities but do exhibit a few traces of Achaemenid orthography (e.g. the writing of long consonants with *n*, as in one instance of *mnd’m* “whatever” instead of the spelling *md’m*, which is also employed) that was gradually encroaching on local scribal practice (Gzella 2011a: pp. 582–583, 2015: pp. 147–150). In addition, many Persian loanwords in the Aršama correspondence and their absence in the Hermopolis

papyri reinforce the difference between highly official and sub-standard Aramaic texts. The place of origin, the genre and register of a text, and the degree of formal education of a scribe thus constitute a complex interplay of factors that cause variation. However, attempts at identifying regional varieties within Achaemenid Aramaic proved unsuccessful, and the provenance of a text cannot be ascertained on linguistic grounds (see Gzella 2015: pp. 159–160).

Contact with other languages, too, left many traces in Achaemenid Aramaic, especially in the form of lexical loans. Some less obvious features, such as changes in word order including the frequent clause-final position of the verb, grammatical constructions, and sentence structure in general, may also result from the replication of foreign use patterns, although these are not yet well known. Multilingual scribes and interpreters in the homeland and in the provinces (Tavernier 2008: pp. 60–63 gives an overview of ancient sources referring to them) disseminated the results of such contact throughout the empire. Numerous Akkadian influences (Kaufman 1974) had entered the language already in preceding stages, but the Babylonian dialect of Akkadian continued to be used for certain official purposes in Babylonia, as is evidenced by economic documents. Borrowings from Persian (Muraoka and Porten 2003: pp. 342–345) first appear in Achaemenid times and often relate to the sphere of administration.

Individual words and expressions concerning everyday life have been taken over from local idioms; hence the Aramaic texts from Egypt contain a fair share of Egyptian lexemes, in particular naval terminology (Muraoka and Porten 2003: pp. 345–347). The situation in other parts of the empire is less well documented, but Aramaic and Elamite, which has a long and distinguished history of its own as an administrative language in the ancient kingdom of Elam, clearly coexisted in Persepolis. Moreover, multilingual inscriptions from Asia Minor with parallel versions in Lydian (from Sardis: KAI 260), Greek (from Limyra: KAI 262), or Lycian and Greek (from Xanthos: KAI 319) next to an Aramaic text prove that local idioms continued to be used even for public representation in some regions. It is likewise difficult to assess the impact of Achaemenid Official Aramaic on Syria-Palestine, the old homeland of the Aramaic language. Changes in the distributional pattern of the regional idioms as reflected by the epigraphic record suggest that Hebrew and the related dialects of the Transjordan area were increasingly marginalized or became confined to specific speech situations, such as religion in the case of Hebrew, and that Aramaic dominated many areas of daily life (Gzella 2015: pp. 190–193; 225–230). Phoenician inscriptions from Persian and Hellenistic times indicate, however, that this language preserved its local prestige and continued to be employed at least in monuments for public display. Yet it should be borne in mind that the limited written evidence does not

necessarily provide a representative view of the language situation as such and of the use of regional vernaculars. See Gzella (2011c) for a brief summary of the linguistic history of the region.

A recent grammatical outline of Achaemenid Aramaic proper against its linguistic background can be found in Gzella (2011a). Muraoka and Porten (2003) provide a full synchronic reference grammar of the material from Egypt, which forms but a part (albeit an important one) of the total evidence. A comprehensive modern reference grammar of Achaemenid Aramaic as such still has to be written. The entire lexicon is included, with full scholarly bibliography, in the standard dictionary by Hoftijzer and Jongeling (1995); the historical semantics and actual use of a large part of the vocabulary are discussed extensively in the various articles in Gzella (2016).

Documentary Texts

Most of the surviving material in Aramaic from Achaemenid times consists of letters, contracts, and economic documents; various smaller honorific, dedicatory, and funerary inscriptions; and short marks on seals, coins, and other items (see Gzella 2004: pp. 35–56 and 2015: pp. 182–208 for brief synopses). Longer texts were written on perishable material like papyrus or leather, so Egypt, thanks to its dry climate, is overrepresented in the available evidence. Obviously, not all Aramaic texts discovered in Egypt are of local provenance, but a large share of them, the so-called “Elephantine papyri,” illustrates daily life and the socioeconomic situation of a fifth-century BCE Judean diaspora community, established by mercenaries some time before (Grelot 1972: pp. 33–42), on the island Elephantine on the Nile. In addition, a collection of slave sales from the second half of the fourth century was found in Wadi Daliyeh near Samaria in Palestine. Inscriptions on durable material, by contrast, were discovered throughout the Achaemenid Empire: from Egypt, the Arabian Desert, Asia Minor, Palestine, Babylon, Persepolis, Afghanistan, and Pakistan. They all conform, to varying degrees, to the linguistic standard set by the Achaemenid administration, depending on their public or private character. In the absence of other criteria, a tentative date can often be established on grounds of paleography.

The Aramaic texts from Egypt until the Ptolemaic period have been collected and collated by Porten and Yardeni (1986–1999 = TAD, together with drawings, a translation into English and Modern Hebrew, and bibliographical references). Nonetheless, the respective first editions with their philological commentary and photographs must form part of any serious study. A selection of Aramaic papyri from Elephantine in an annotated translation is also available in Porten et al. (1996: pp. 74–276); the notes and introductory paragraphs

accompanying the French translation by Grelot (1972) are still quite serviceable, too. The Wadi Daliyeh papyri have been published by Gropp (2001) and, more recently in their entirety, by Dušek (2007). No such comprehensive collection exists for the inscriptions, but Schwiderski (2004, with an eclectic reading of the relevant texts, though without translation and notes) can be used as a point of departure and for bibliographical indications. Donner and Röllig (1966–2002 = KAI) give a representative selection of the most important pieces with a German translation and a philological commentary; other selections of a similar kind are less reliable. Fitzmyer and Kaufman (1992) provide an overview of older scholarly literature.

It is the use of Aramaic in domestic and provincial administration that best illustrates its role as an official language of the Achaemenid Empire. The large corpus of the mostly Elamite Fortification tablets from Persepolis, which record the assignment of food rations to persons affiliated in various ways with the royal palace, contains both texts with an Aramaic version and several hundreds of small tablets written in Aramaic alone. They do not lend themselves to easy access and remain unpublished to date (Azzoni 2008 gives a preliminary account). Some also refer to documents written on leather, the language of which, in all likelihood, was Aramaic, because the cuneiform script of Elamite, geared toward being inscribed with a stylus in wet clay, was unsuitable for being used with ink and on flat surfaces. Moreover, 163 mortars, pestles, and other stone objects discovered at the royal treasury bear short Aramaic inscriptions (Bowman 1970, whose erroneous interpretation as ritual texts has been abandoned in the meantime, see Naveh and Shaked 1973). The exact distribution of Aramaic and Elamite as administrative languages in Achaemenid Iran remains a matter of controversy, though, and cannot be easily explained on grounds of a sudden switch from Elamite to Aramaic alone. Tavernier (2008) has a useful synopsis of the current state of the discussion.

Evidence from top-level administration in other satrapies further contributes to understanding the role of Aramaic as an international language in the Achaemenid Empire, even if no complete satrapal archive has yet been discovered. Of particular importance are the 13 letters and fragments of Aršama (TAD A6.3–16; Driver 1965 and, for the photographs, 1954), who acted as the satrap of Egypt at the end of the fifth century BCE. They reflect the spelling conventions, epistolary phraseology, and procedural *mores* of the Persian chancery, although they are not predominantly concerned with the public sphere. Written on leather in a clear, authoritative, no-nonsense style and dispatched from the Achaemenid heartland to Egypt (presumably to his headquarters in Memphis, but the place of discovery remains unknown), they illustrate the way in which a leading Persian official instructed his managers to carry out their responsibilities and to look after his estates abroad. A few letters sent by his subordinates show how his orders flowed downward along the

chain of command. In addition, Aršama features in two letters found at Elephantine (TAD A6.1–2).

A likewise official usage of Aramaic is attested for other eastern and western provinces, even where Aramaic had no prior history as a spoken or written idiom. The correspondence of a local governor with the satrap of Bactria in the second half of the fourth century BCE, consisting of 30 letters on parchment, now makes the most substantial addition to the very meager textual evidence from outside Egypt and Iran (Naveh and Shaked 2012; discussed at greater length in Chapter 66 Bactria). From Daskyleion in Asia Minor, the residence of the satrap of Phrygia, 12 clay envelopes (*bullae*) with the (generally Iranian) names of their proprietors on Aramaic tags and seals have survived (Röllig 2002); they, too, bear witness to Aramaic letter-writing in provincial administration. Coins from Cilicia with Aramaic inscriptions (Vattioni 1971: pp. 70–78) and a trilingual stele (Aramaic, Lycian, Greek) issued by Pixodaros, the satrap of Lycia and Caria, in order to confirm the foundation of a new local cult at Xanthos in 337 BCE according to official Achaemenid procedure (recent bibliographical information is available in Funke 2008), also reinforce the use of the language in matters pertaining to the government.

The role of Aramaic in the communication of local authorities during the Achaemenid period is best attested for Egypt, chiefly thanks to the Elephantine papyri. These exhibit a higher degree of spelling variation, including some phonetic spellings, than, for example, the Aršama letters, which indicates that they were produced by Aramaic-speaking inhabitants. Topics of interest to a Judean expat group, at a time when Judaism began to take on its distinctive shape, surface in the 10 letters and fragments of the archive of Yedaniah, the son of Gemariah, the leader of the community during the end of the fifth century. Two versions of a rhetorically forceful letter seeking permission from the governor of Yehud to rebuild the local temple (TAD A4.7–8) are particularly famous, as is the memorandum of the governors of Yehud and Samaria granting this request (TAD A4.9). Both versions appear to be drafts, with some modifications, that have been preserved in the communal archive. Another letter, though highly fragmentary, is usually interpreted as an early reference to Passover, based on a reasonable yet not entirely certain reconstruction of the missing parts (TAD A4.1), and the others address various matters illustrating the sometimes-uneasy relations of the Judean community with the Egyptian population.

As a language of private law, too, Aramaic is particularly well attested in Achaemenid Egypt, where it coexisted with Demotic. The oldest datable legal text, a lease written in 515 BCE, originates from Korobis in the Nile Delta and reflects traces of a preceding Aramaic scribal tradition (TAB B1.1). The family archives of Mibtahiah (471–410 BCE; TAD B2.1–11) and of Ananiah

(456–402 BCE; TAD B3.1–13) contain bequests, marriage contracts, and property transactions. Twenty-one loose documents with deeds of obligation (TAD B4.1–7), conveyances (TAD B5.1–6), marriage documents (TAD B6.1–4), and judicial oaths (TAD B7.1–4) have also been discovered. They all mark the beginning of a long-lasting Aramaic legal tradition, with similar or even identical formulae recurring not only in the Hellenistic and Roman Near East but also in the Babylonian Talmud (Healey 2005; Gross 2008). Its origin in older Mesopotamian and West Semitic, local Egyptian, or perhaps even international Iranian law remains a matter of debate (see the introduction by Levine in Muffs 2003: pp. xi–xliv). The Egyptian evidence can now be supplemented by 27 fourth-century slave sales from Wadi Daliyeh in Palestine, which employ a slightly different phraseology (Gropp 2001; Dušek 2007).

In addition, 202 fifth- and fourth-century papyrus fragments relating to law, taxation, and commerce have been discovered at Saqqāra near Memphis (Segal 1983; nos. 8 and 35 have been re-edited in TAD B5.6 and 4.7 respectively). Unfortunately, they are so severely damaged that little reliable information can be derived from them, but they seem to emanate from non-Judean circles. The language exhibits a number of smaller peculiarities as opposed to other sub-corpora of Achaemenid Official Aramaic, yet their diagnostic value is, again, hard to assess. A number of court records (re-edited in TAD B8.1–4; 6–12) shed further light on the workings of legal procedures under Achaemenid administration in Egypt, despite the mostly minimal amount of text preserved, including complaints against a former verdict, cross-examination, oaths, and the decisions taken. About half of these cases concern slaves. Some Persian loans add to their official ring. The same site yields 26 ostraca, 21 of which are thought to be in Phoenician script.

Most economic texts from the provinces have been preserved on papyrus fragments and ostraca from Egypt, easily accessible in TAD C and D, as well as on Palestinian ostraca, especially some 2000 pieces from Idumaea, most of which record the transfer of goods (Porten and Yardeni 2014–2020). The latter in particular illustrate the well-entrenched employ of Aramaic also for base-level bookkeeping in a largely agrarian society. Papyrus was used for accounts (TAD C3.1–29) and lists (TAD C4.1–9; personal names of various provenances but of unknown function) that cover a longer period of time or were of more than ephemeral importance, whereas ostraca served for short-term purposes. The extensive customs account of import and export duties dating from 475 BCE and arranged by month (TAD C3.7), which was later erased and replaced by the Aḥiqar wisdom text (see below), is particularly revealing for the economic history of Achaemenid Egypt and Egypto-Aramaic naval terminology: duties were collected from incoming ships and deposited in the royal treasury (Lipiński 1994: pp. 62–67; Yardeni 1994). Information of a similar sort can be found in the poorly preserved Memphis Shipyard Journal (TAD C3.8) for the years 473–471 BCE.

Numerous texts from outside the administrative sphere show that Achaemenid Official Aramaic enjoyed a wide distribution in the Persian Empire: private letters on papyrus and ostraca; various types of stone inscriptions; property marks, seals, graffiti; and so forth. Short though they are, they bear witness to the growing distribution and impact of the orthographical and grammatical norm established by the royal chancery on the use of written language in daily life. The Hermopolis papyri (TAD A2.1–7) illustrate a tradition of Aramaic letter writing in Egypt that precedes the Achaemenid administration but gradually came under its influence; a similar situation may apply to other areas where such documentation is no longer available simply because the evidence has not been preserved. The majority of the short epistolary communications come from Elephantine and are written on ostraca; they generally concern matters of everyday economic life and often contain requests to dispatch certain goods (Lozachmeur 2006, a small part of which was previously published in TAD D; most of the 280 pieces in this collection are in Achaemenid Aramaic). Besides a few writing exercise tablets with the letters of the alphabet in a specific order (TAD D10.1–2; cf. 22.28), little information on the various degrees of literacy among the population in different regions and on the educational framework is available. The fact that people were presumably able to write their own names in clumsy letters does not exclude that many of them needed professional scribes for letters and other more advanced matters (Grelot 1972: pp. 48–56). The use of Aramaic for private representation surfaces in a number of dedicatory, funerary, and memorial inscriptions from Arabian Tayma, Asia Minor, and Palestine.

Literary Compositions

While documentary material constitutes the lion's share of the surviving sources, traces of a literary tradition in Aramaic during Achaemenid times can also be identified. Yet it is practically impossible to assess the true extent of this tradition and the role of non-documentary compositions in society: were they, or at least their general contents, known to significant parts of the population? Or was their use confined to scribal education, where they served as a medium of instruction (copying texts was a core activity in the training of Near Eastern scribes at various periods) and, perhaps, also as a model for stylistic imitation? Or did they form some common ground that defined the cultural self-awareness of the small elite of the Achaemenid mandarins, as did the Greek and Latin classics for generations of British civil servants? For the time being, such questions must remain unanswered.

Three texts on papyrus that can safely be subsumed under the category “literary,” in the broadest sense of the word, have been found at Elephantine

in Egypt. There is the story about Aḥiqar, an advisor to the Neo-Assyrian court who, thanks to his insight and personal integrity, survived a plot against him; a number of older traditional wisdom sayings ascribed to this sage were then attached to the narration (TAD C1.1). Another tale, about Bar Puneš (TAD C1.2), is so fragmentary that but little can be said about its contents except that it seems to take place at a royal court. And a fragmentary Aramaic version of the Bisotun inscription with the *res gestae* of Darius I (TAD C2.1; Greenfield and Porten 1982) has been translated from the Babylonian and supplements the Elamite, Old Persian, and Babylonian trilingual inscription gracing the famous rock monument in Media, as well as the Neo-Babylonian copy from Babylon. It is unclear whether Darius II had distributed a text celebrating the deeds of his predecessor throughout the empire in order to honor him (in accordance with §70 of the Persian original), or whether the copy discovered at Elephantine served as an exercise in scribal training. Since it closely corresponds to the orthographical and linguistic standards of Achaemenid Official Aramaic, it would, at any rate, have been a suitable model.

The origin of the Aḥiqar wisdom text is more difficult to trace, in particular because Aḥiqar was and is a well-known figure in Near Eastern literature up to the present day (Contini and Grottanelli 2005). Thanks to the underlying customs account (TAD C3.7), which is arranged chronologically, the original sequence of the surviving parts of the palimpsest can be determined (Gianto 1995: pp. 87–89). Apparently, the preceding narrative frame in Achaemenid Official Aramaic served as an introduction to the ensuing sayings; the latter are entrenched in older lore and composed in a pre-Achaemenid variety of Aramaic the provenance of which remains elusive (see Weigl 2010, with copious bibliographical references). Scholars are divided as to whether they were written in eighth- or seventh-century southern Syria or in seventh- or sixth-century (north-)western Mesopotamia (Weigl 2010: pp. 677–678; Gzella 2015: pp. 150–153), a question not easy to answer given the very limited attestation of Aramaic during that period. One could imagine that the Aḥiqar composition was used not only for teaching a formal style of Aramaic for administrators in the make (hence perhaps some archaic rings in the narrative) but also for depicting the moral and intellectual ideal of a loyal court official. The rich vocabulary and high amount of syntactic subordination show that the language of the proverbs is a literary idiom (see also Gzella 2017). Interestingly, Aḥiqar occurs on a fragmentary Demotic papyrus (Betrò 2005), and Bar Puneš may be identical to the well-known magician Hor-son-of-Puneš in Demotic literature, although the reading *ḥmr* in TAD C1.2 remains controversial (Gianto 1995: pp. 90–91). An ink inscription on the walls of a burial cave near Sheikh Fadl (TAD D23.1) may contain another literary composition from the Achaemenid

period, but it is so fragmentary and palaeographically so difficult that its contents cannot be clearly determined.

Despite these few surviving non-documentary sources in Aramaic dating from the former half of the first millennium, some vestiges of a broader literary tradition can be reconstructed in light of later evidence. However, such a supra-regional “Standard Literary Aramaic” did not exist alongside Achaemenid Official Aramaic (as Greenfield 1974, who coined the term, and others maintained) but formed a subset of it (Gzella 2008: pp. 108–109, 2015: p. 165). The roots of the Aramaic parts of the Books of Ezra and Daniel in the Achaemenid chancery idiom can still be determined, even if contact with the local Aramaic variety in Judaea and successive phases of redaction have left their traces in what might have been a fourth-century BCE core (Gzella 2004: pp. 41–45, 2015: pp. 205–208; on the linguistic peculiarities of Biblical Aramaic, see also Gzella 2011a: pp. 583–584). This idiom over time evolved into a local official language (“Hasmonaean”) that is attested in Aramaic religious compositions and legal documents from the Dead Sea (Gzella 2015: pp. 230–234). Scholars have also tried to identify poetic elements in non-literary genres like an Aramaic funerary inscription from Achaemenid Egypt (KAI 269 = TAD D20.5), now in Carpentras (cf. Nebe 2007: p. 74), but this remains somewhat speculative.

It is not unreasonable to assume that the spread of Achaemenid Official Aramaic and the consolidation of a longer-lasting institutional environment that upheld it created the backdrop for an Aramaic “world literature” to evolve. Although its true extent cannot be outlined, remains of an erstwhile common literary language still surface in various local traditions during the post-Achaemenid period and point to such a shared matrix. Court novels in particular, as in *Ahiqar*, *Daniel*, and some Qumran texts, constitute a genre closely associated with Aramaic (Gzella 2017). As a universal medium of expression, Aramaic could promote exchange of literary motives and figures between Egypt and Mesopotamia during the Achaemenid period. One can also suppose that knowledge of Mesopotamian science, glimpses of which appear in later writings, spread via lost Aramaic translations of technical writings (Ben-Dov 2010).

Aftermath

The Persian administration consolidated earlier networks between Aramaic-speaking regions throughout the empire and thus created a lasting heritage that outlived its chancery. By that time, Aramaic was deeply entrenched as a language of administration, law, and religious literature, which consolidated its long-term success. Once the central authority disappeared with Alexander’s conquest, elements of the official scribal tradition could interact more freely with regional forms of Aramaic, and linguistic innovations could spread more

easily across the speech area (see Gzella 2011b and, more extensively, 2015: pp. 212–280 for an overview). Although it quickly faded away in Anatolia and lasted only until the Ptolemaic period in Egypt, the use of Aramaic as a standardized written, though not necessarily spoken, language largely continued in the western and eastern peripheries of the dialect landscape, in the form of very conservative varieties in northern Arabia (especially Nabataean) and Parthia (scattered epigraphic material and Aramaic ideograms in Middle Persian). In Hellenistic-Roman Syria and eastern Mesopotamia (Palmyra, Edessa, Hatra), by contrast, several regional dialects of Aramaic were promoted to chancery idioms of small local kingdoms, yet were highly influenced by received spelling conventions. Judaea, finally, saw the gradual transformation of an Aramaic literary heritage into a new form of Jewish literary Aramaic between the fourth and the second centuries BCE. As a result, the end point of Achaemenid Official Aramaic is hard to determine. Aramaic still acted as a prestigious vehicle for reasserting local cultural self-awareness in Hellenistic and Roman times (Gzella 2006; Healey 2009: pp. 1–51) and subsequently produced a number of long-lasting religious literatures in Late Antiquity (Gzella 2015: pp. 281–381).

CHAPTER 10

Biblical Sources

Reinhard G. Kratz

Epigraphical Sources

Epigraphical sources from Judah and Samaria in the period of the Achaemenid Empire are relatively rare (Stern 1982; Lemaire 2002b, 2007, 2015; Grabbe 2004: pp. 54–69). Taken together with the evidence from the Egyptian (Porten and Yardeni 1986–1999, quoted as TADAE) and Babylonian diaspora (Pearce 2006, 2011; Pearce and Wunsch 2014; Wunsch and Pearce forthcoming; see also Kratz 2015: pp. 136–153; Lemaire 2015: pp. 37–73), they allow for a spotlight on the political, economic, social, and religious-historical situation of Judaism during the Persian period and are therefore of special historical value.

Three kinds of epigraphical sources have come down to us from Judah and its vicinity in southern Palestine: stamp impressions (Avigad 1976; Ariel 2000; Lipschits and Vanderhooft 2011), coins (Meshorer 1982, 1990/91, 2001; Mildenberg 1988, 1996) and ostraca (see Lemaire 2002b, esp. Eph'al and Naveh 1996; Lemaire 1996, 2002a, 2006, 2007; Porten and Yardeni 2006; see also Kratz 2015: pp. 181–187; Lemaire 2015: pp. 86–98).

The inscribed stamps, bullae, and seals stem from the Judean economic life and are also attested for external trade (Lemaire 2002b: p. 217). Additionally, they shed light on the political structure (Carter 1999; Kratz 2004: pp. 93–106; Lemaire 2007). They suggest that Yehud was an independent administrative unit or even a province with a governor since the beginning of the

Achaemenid period. This conclusion is supported by the inscriptions *yh*, *yhd*, or *yhwd* designating the province, and *phw* designating the governor (Lipschits and Vanderhooft 2011: pp. 77–80). The personal names mentioned do not allow for a chronological order but provide us with a list of governors for the end of the sixth and the fifth century BCE. During the fourth century BCE Bagoas/Bagohi was governor, followed by Yeheziah; one is attested in the papyri from Elephantine (TADAE A4.7–8 and A4.9) the other on Judean coins (Meshorer 2001: pp. 15–16; Lemaire 2015: p. 95). Both of them were contemporaries of Sanballat and his sons as well as a Hananiah in Samaria (see below). In analogy to Samaria and Elephantine one would expect that the administrative center of Yehud had the status of a “fortress,” but this is attested only in literary sources for Jerusalem (Neh 2:8; 7:2). The papyri of Elephantine mention the “high priest and his colleagues, the priests who are in Jerusalem” (*khn' rb' wknwth khny' zy byrwšlm*) as well the “nobles of the Judeans” (*hry yhwdy'*) as further officials in Yehud (TADAE A4.7–8; cf. Neh 2:16–18).

The coins provide valuable information about the monetary system during the fourth century BCE and the various cultural influences that manifest themselves in the minting. Amongst those coins two specimens are of special significance as they shed some light on the order of high priests in Jerusalem. Two, if not three, high priests are attested epigraphically: Yohanan (I.) mentioned in the papyri from Elephantine around 400 BCE (TADAE A4.7–8; cf. Neh 12:22); his son and successor Jaddua, who appears on a Judean coin from the second half of the fourth century BCE (Spaer 1986/7; cf. Neh 12:11.22); and Yohanan (II?) on a further Judean coin from the end of the Persian period (Barag 1986/7; Meshorer 2001: p. 14), who is most likely to be identified with Onias I. (Josephus, Ant. 11.347; for a different view, see Lemaire 2015: pp. 94–95, who – following L. Fried – identifies this one with Yohanan I). In light of the epigraphic evidence, taking into account the possibility of longer periods of office, the list in Neh 12:10f., 22.26 appears to be complete (Vanderkam 1991; Kratz 2004: pp. 106–111; Dušek 2007: pp. 549–591). A coin depicting a deity on a winged wheel is of special religious-historical importance (Meshorer 1982: pp. 21–30); the identification of the deity, however, is disputed (Grabbe 2004: pp. 66–67; Lemaire 2015: p. 93).

The ostraca inform us about the economic situation in Judah and in its vicinity in southern Palestine (Lemaire 2015: pp. 98–122). In addition, they contain a plethora of personal names that help to decipher the ethnic makeup of the population as well as the religious plurality. The theophorous element in the Judean onomasticon seems to be limited to EL and YH/YHW = biblical Yhwh (Lemaire 2002b: p. 217). We also have Aramaic, Phoenician, Edomite, and Arabian personal and divine names (Lemaire 2002b: pp. 224–226;

Porten and Yardeni 2006; Kloner and Stern 2007; E. Eshel 2007). In this context an ostrakon that mentions the sanctuaries of three deities is of special interest: “House (i.e. Temple) of ‘Uzza,” “House of Yahu,” and “House of Nabu” (Lemaire 2002a Nr. 283; cf. Lemaire 2001, 2006: pp. 416–417; 2015: pp. 118–119). Apparently the cultic worship of the Judean-Samaritan deity Yahu was not limited to the “place that Yhwh will chose” (Deut. 12) during the fourth century BCE. The historical constellation represented in the epigraphic material appears not to differ from the one of the Judeans at Elephantine (Kratz 2006, 2009, 2010, 2011, 2013, 2015; Becking 2011: pp. 128–142) or from the (Israelite) worshippers of Yhwh in the Province of Samaria.

At Wadi Daliyeh, 14 km north of Jericho, excavations have yielded – besides several human skeletons – Aramaic papyri, clay bullae, and coins from Samaria (Leith 1997; Gropp 2001; Dušek 2007; Kratz 2015: pp. 165–181; Lemaire 2015: pp. 75–86; on Samaria see also Zengellér 2011; Frey, Schattner-Rieser, and Schmid 2012; Knoppers 2013; Hensel 2016). How this material arrived at its place of discovery we do not know. It is commonly presumed that refugees transported the material there when they had to flee from the city of Samaria after the failed uprising against Andromachos, the prefect of Alexander the Great. The papyri are not very well preserved but due to their formulaic character they can be fairly well reconstructed. The material stems from the fourth century BCE and more precisely from the time of Artaxerxes II to Darius III. The coins discovered in various places of the Province of Samaria can be dated to the same period (Meshorer and Qedar 1991, 1999; Mildenberg 1996). The papyri are private deeds that first and foremost deal with the selling of slaves, but there is also the deed of a house sale and receipts for the repayment of a loan; in one case we may even have the minutes of a legal dispute. The clay bullae and coins are of interest because of their iconography. Here too, the minting shows different (Egyptian, Mesopotamian, Persian, and Greek) cultural influences and motifs, amongst them representations of deities and naked men. Especially significant is a coin that shows a portrait and inscription of the god Zeus on one side and has a Yahwistic name on the reverse (Lemaire 2002b: p. 223; 2015: pp. 81–82). The rededication of the two temples of Yhwh on Mt. Gerizim and in Jerusalem to sanctuaries of Zeus under Antiochus IV obviously fell on fertile ground.

The onomasticon of the papyri from Samaria as well as of the inscribed bullae and coins attests a similar picture (Lemaire 2002b: pp. 221–222; Dušek 2007: pp. 486–495). Here we have – especially amongst the owners, contractual partners, and slaves – mostly Israelite-Judean names; next to them and especially amongst the witnesses for the deeds and the officials there exists a plethora of Aramaic, Phoenician, Edomite, Akkadian, and Persian names.

Being aware of the problems and pitfalls of the interpretation of such findings we can, nevertheless, say that the situation is reminiscent of the situation in Judah and Elephantine and implies the same historical constellation: we learn of a coexistence and cooperation of several ethnicities within the political structures of the Persian Empire. These ethnicities do not define their identity by a strict separation from each other; rather, they live side by side while at the same time ensuring their own identity. An influence of biblical norms on daily life, for example in matters of slave trade or ethnic separation, cannot be detected in the preserved documents.

The political structure, too, reflected in the epigraphic material reminds us of its Judean neighbors and of Elephantine. The name Samaria is attested in its long form (*šmr̄yn/šmr̄n*) as well as in abbreviations (*šmr̄*, *šm*, *šn*, *š*). The Persian satrapy of Transeuphrates is the superordinated political unit. Its satrap Mazaios/Masdaj is mentioned by its full name or in abbreviated form (*mz*) on coins: “Mazday who resides over Ebir-nari and Cilicia” (*mzdy zy ʿl ʿbr nhr̄a wḥlk*). Samaria itself had the status of a province (*šmr̄yn mdyntʾ*) and was ruled by a governor (*ph̄t šmr̄yn/šmr̄n*). The capital is called a “fortress” (*šmr̄yn byrtʾ*). In accordance to this terminology, the papyri are written “in the fortress Samaria (that is) in the Province of Samaria.” Coins mention a prefect (*sgnʾ*) and judges (*dynʾ*) as subordinate officials. In addition we have several names without a title; here we can assume that they belong to further administrative officers who had the right to mint coins, amongst them maybe even priests as they belong to the ruling elite of a “fortress” – both in the Province of Yehud and in Elephantine.

The direct historical contact with the Judean “fortress Yeb” (Elephantine) is established by the figure of Sanballat, the governor of Samaria who is mentioned in the epigraphic material from Samaria as well as in the papyri from Elephantine. In both cases his sons are mentioned too as they either represent their father or succeeded him in office. There is one son with a Yahwistic name attested on a seal from Samaria (WD 22). Then we have the two sons called Delaiah and Shelemiah in the papyri from Elephantine where they were involved in the rebuilding of the temple in Elephantine (TADAE A4.7–8 and A4.9); they may also be represented by the abbreviations *dl* and *šl* on Samaritan coins. One of the Samaritan papyri from the year 354 BCE also mentions a governor called Hananiah. This attestation helps to reconstruct the list of the governors of Samaria from Darius II down to Darius III: Sanballat and his sons Delaiah, Shelemiah and [?]YHW (Delayahu?) in the first half and Hananiah in the second half of the fourth century BCE. The common assumption of two or three governors bearing the same name – an assumption trying to harmonize the epigraphic material with the account of Nehemiah (Neh. 2:10.19, etc.) and Josephus (AJ 11.302–303) – is superfluous (Kratz 2004: pp. 93–106; Dušek 2007: pp. 516–549, 2012a; followed by Lemaire 2015: p. 83).

To complete the picture let us mention in passing a further corpus of inscriptions, namely Aramaic and Hebrew votive inscriptions discovered on Mt. Gerizim. According to the excavators these inscriptions could date back to the fifth and fourth centuries BCE (Magen Misgav, and Tsfania 2004; Magen 2008: pp. 227–242) but they appear more likely to be products of Hellenistic times (Dušek 2012b; De Hemmer Gudme 2013). They are, nevertheless, relevant for the Persian period as they refer to a temple already founded in the fifth century BCE that was the central sanctuary of the worshippers of Yhwh in the Province of Samaria (Magen 2008). Like the persons whom we know from the material from Wadi Daliyeh and from the coins who bear Yahwistic names, so the Yhwh worshippers from Mt. Gerizim were “Samaritans” or “Samaritans.” This label – like “Judeans” in the Province of Yehud or in Elephantine – is nothing more than a local, political, and ethnic attribute. In Hellenistic times these Samaritan Yahwists occasionally called themselves “Israelites” (*Delos*) and accepted the Pentateuch, the Torah of Moses, as their holy scripture. Whether this was already the case during the Persian period is a historical problem yet to be solved (Knoppers 2006; Kratz 2007, 2015; Dušek 2012b: pp. 65–118), as is the relationship of the Yahwists represented in the inscriptions from Mt. Gerizim to the Yahwists known to us from epigraphic material of the Achaemenid period.

Literary Sources

Literary sources that are attested archeologically in the Achaemenid period are only known to us from Elephantine: Here we have the “Words of Ahiqar” and an Aramaic version of the Bisitun inscription (TADAE C1.1 and C2). Otherwise we have to rely entirely on the biblical tradition and on the tradition dependent on it, such as the *Jewish Antiquities* of Flavius Josephus.

In contrast to the literary works from Elephantine that fit well into the picture reflected by the epigraphic material, the biblical tradition contains a series of particularities. On the one hand, it presupposes the situation reflected in the epigraphic material, and the Bible sometimes even contains information – especially names and individual dates or even literary pieces – that can be aligned with the archeological findings. On the other hand, in its vast majority the biblical tradition has little to do with the epigraphic material and should not be harmonized with it hastily (Edelman 2012). Rather, the Bible seems to be highly critical toward the historical situation and even rejects it by creating its own religious counter-world, a world that centers on the Torah of Moses and/or the biblical prophets (Kratz 2004: pp. 93–119, 2015).

In a way the biblical writings are timeless. Apart from a *terminus a quo* if it is mentioned in a writing and the *terminus ad quem* of the biblical manuscripts

from Qumran, that begin in the third century BCE, it is very difficult, if not impossible, to offer exact dates for a biblical text or to verify the historicity of the biblical statements and to reconstruct from them the history of Israel during the Persian period (Galling 1964; Williamson 2004). The historical evaluation of the biblical sources has to take all these factors into account and makes a literary-critical analysis as well as an analysis of the *Tendenz* of text mandatory. Here, one has to accept that one will hardly ever reach beyond a well (or less well) argued hypothesis.

Within the biblical tradition we have to distinguish between writings that are set in the Persian period but not necessarily written during this period and those texts of which scholarship assumes that they were composed in Persian times even though Persia is not mentioned in them. The historical narratives in (2 Chron. 36) Ezra–Nehemiah, 1 Esdras and Esther as well as the prophecies in Isaiah 44–45, Haggai, Zechariah, and Daniel can be counted to the first group. In these writings the roughly 200 years of Persian rule over Judah and Samaria are condensed to three – if we add Esther, four – events: (i) the end of the Babylonian exile and the rebuilding of the temple under Cyrus and Darius (2 Chron. 36; Ezra 1–6 and 1 Esd.; Isa 44:28–45:13; Hag.; Zech. 1–8; Dan. 1:6 and 8–11); (ii) the mission of Ezra under Artaxerxes (Ezra 7–10; Neh. 8; 1 Esd.); (iii) the mission of Nehemiah under Artaxerxes (Neh. 1–13); (iv) the rescue of the Jewish people under Xerxes (Esther).

In two cases the biblical tradition has a point of reference in history: the rebuilding of the second temple and the rebuilding of the walls of Jerusalem. Two – possibly authentic – prophetic oracles from the time of the reconstruction of the temple have come down to us and are now incorporated into the book of Haggai: Hag 1:1.4.8 and 1:15–2:1.3.9a. Both oracles are dated according to the ruling king Darius and call for the beginning of the building activity. Scholars generally identify this king with Darius I but there are dissenting voices that place the building of the temple during the time of Darius II (Dequeker 1993) or Artaxerxes I (Edelman 2005). The two oracles were gradually supplemented within the book of Haggai and joined with the visions of Zechariah that are only secondarily connected with the temple. Both prophetic books contain some Persian flavor, but we cannot derive reliable historical information from them. Even the role of Serubbabel and Joshua remains unclear as they both appear only in secondary, i.e. later, passages (Kratz 2004; Hallaschka 2011). The same has to be said of the figure of Sheshbazzar, who is mentioned only in Ezra 1:7–11 and Ezra 5:14–16 (6:5?) and who cannot be placed historically (Kratz 2004: pp. 101–102, 105–106).

The oracles in Isaiah 44–45 (Kratz 1991a), the narrative in Ezra 1–6 and 1 Esdras (Kratz 2000: pp. 56–67), as well as the literary reflexes on the beginnings of Persian rule in the book of Daniel (Kratz 1991b), have to be seen as later literary creations that have little historical value. A comparison of the

Aramaic narrative in Ezra 5–6 – which is the literary nucleus of Ezra 1–6 where we find the older variant of the two versions of the famous edict of Cyrus (Ezra 1,1–4; 6,1–5) – with the papyri from Elephantine shows that this narrative appears to work with general historical knowledge and contains quite a bit of the flavor of the time. This, however, does not imply that the material has to be regarded as historical. Rather, Ezra 5–6 are written in the spirit of the biblical tradition and they are indebted to the Chronistic view of history (Kratz 2006).

The mission of Nehemiah, too, has a concrete historical anchor: the building of the walls of Jerusalem (Kratz 2000: pp. 68–74, 2004: pp. 93–106; Wright 2004). The original building report is a short first-person narrative: Neh. 1:1a,11b; 2:1–6,11–18; 3:38; 6:15. The mission is commonly dated to the year 445 BCE, the 20th year of Artaxerxes I. The reason for this dating is the figure of Sanballat, governor of Samaria, who is mentioned not only in the papyri from Elephantine for the time around 410 BCE but also in the book of Nehemiah. This dating, however, is not certain as Sanballat does not appear in the original building report. On the other hand, the building of the walls fits well with Persian policy of the fifth century (Hoglund 1992; Carter 1999; Lipschits 2006, 2012) as it would transform Jerusalem into a fortified garrison and possibly also into the capital of the Province of Yehud. Nehemiah reminds one of the ambassador Hananiah who is mentioned in the papyri from Elephantine (Kratz 2009). All the other passages of the book of Nehemiah, including those designating Nehemiah as “governor” (Neh. 5:14–19; 12:26), are secondary literary supplements that were added to the building report in order to integrate Nehemiah into the (biblical) sacred history of the people of Israel, i.e. the people of God. Their historical appraisal stands on very shaky ground.

The evaluation of the mission of Ezra, reported in Ezra 7–10 and Neh 8–10, is most difficult (Kratz 2000: pp. 74–90, 2004: pp. 111–118, 2008). His mission too is dated to the reign of a king called Artaxerxes. Scholarship generally identifies this king with Artaxerxes II since Nehemiah does not seem to presuppose Ezra. Such a dating operates on the premise that the Ezra memoir existed independently and is historical. This approach blends the historical and literary levels of the narrative. The historical fiction of the biblical tradition emphasizes that the same Artaxerxes is meant here. Ezra and Nehemiah are supposed to be contemporaries in order to complete the restitution of the people of Israel in the Province of Judah in accordance with the Mosaic law (Willi 1995). Only in literary-historical terms Ezra is younger than Nehemiah.

Historically, however, we can say little about Ezra. The Aramaic rescript in Ezra 7 forms the literary kernel of the Ezra narrative: Apart from bringing donations to Judah, Ezra is ordered to ensure the execution of the law (*dat*)

of the Jewish God, that is identical to the law (*dat*) of the king, in the territory of Transeuphrates. The Hebrew narrative in which Ezra executes this order (Ezra 8–10; Neh. 8–10) is dependent on this rescript. The authenticity of the Aramaic rescript that once again is a mixture of Persian period flavor and biblical topoi continues to be disputed since the time of Eduard Meyer and Julius Wellhausen (Kratz 2004: pp. 6–22). Despite the ongoing debate the authenticity is unlikely (Schwiderski 2000; Grätz 2004). The text reads like a foundation legend of the legal status of the Torah of Moses in Judaism and is comparable to the Letter of Aristeas reporting the origin of the Greek translation of the Torah in Alexandria under Ptolemy II. The historical background of the Ezra legend is probably the experience of the growing dissemination of the Torah as binding commitment in Judah and Samaria; this dissemination possibly started during the Persian period but came to full effect only in Hellenistic times. During the same period 1 Esdras, an epitome of 2 Chr 35–36 + Ezra–Nehemiah in Greek was written; here Nehemiah is missing and the mission of Ezra forms – after the rebuilding of the temple – the culmination. This version of the Ezra material is also the basis for Josephus in *Ant.* 11.1–158. 4Ezra then – written after 70 CE – represents an even later reception of the figure of Ezra (Kratz 2008).

The Book of Esther, too, is a legend that grew over a longer period. It has come down to us in two different versions, a Greek and a Hebrew one (Clines 1984; Fox 1991; Jobes 1996). The book relates the story of a pogrom against the Jewish people and closes with the establishment of the festival of Purim. The king mentioned in Est 1:1 shall be identified with Xerxes I so that the fictitious story line is situated after the building of the temple (Darius I) and before Ezra and Nehemiah (Artaxerxes I). Links to these events, however, are not to be found in Esther. The book of Esther displays an extraordinary familiarity with details of the Persian court – commentaries generally quote the corresponding parallels from Herodotus and Xenophon. This general knowledge is supplemented with all kinds of fantastic details such as the marriage of the Xerxes to the Jewess Esther and woven into a narrative that portraits – in recourse to the biblical tradition – the situation of the Jews in the eastern diaspora (Hagedorn 2011).

Not the events are historical but the general experience that is used as incident and cause for the foundation of a festival tradition. The narrative focuses on the experience of localized hostility against and persecution of members of the Jewish people that sometimes happened in the diaspora and that will serve as the cornerstone for the hatred of the Jews in Antiquity. An authentic example of such an experience is the destruction of the Judean Temple of Yahu on Elephantine – an event that served as the point of departure for the formation of legends about the past under Cambyses (TADAE A4.7–8). The book of Esther is an instructive example that one should not use the flavor of a time to

argue for the historicity of the events narrated or to deduce from it a date for the literary origin of the story. The example of Esther should also be used in the interpretation of Ezra-Nehemiah. In both cases the Greek versions (1Esdr. and Greek Esther) show that the legends about Israelites and Judeans during the Persian period – legends on which the self-understanding of Judaism rests – were still relevant during Hellenistic times and were spun out further.

Next to the biblical sources that are set explicitly in the Persian period, scholarship generally dates several other writings or parts of biblical books to this period (Grabbe 2004: pp. 90–106). From the plethora of the material we will simply look at one (significant) example: the completion of the Jewish law in the form of the Pentateuch, the Torah of Moses, a document of which more than half was written or composed in the post-monarchial period, i.e. during neo-Babylonian, Persian, and Hellenistic times (Kratz 2000, 2015). Especially the multiple-layered literary stratum, commonly called “Priestly Writing” (Kratz 2000: pp. 102–117, 226–248), is best explained in reference to the second temple period.

The literary development has been interpreted as a compromise (Blum 1990; Nihan 2007) between several rival groups within Israel (Deuteronomy/Priestly Writing; Golah/Land; Samaria/Judah) – a compromise prompted by an initiative of the Persian authorities or as part of the Persian legal practice called imperial authorization (Frei 1996; on Frei’s thesis see Watts 2001; Knoppers and Levinson 2007). The historical hypothesis lacks any evidence and cannot be supported by the texts themselves. The literary development is undeniable but it can be shown only in a relative chronology of the literary strata. It is further undeniable that we have Pentateuchal manuscripts amongst the Dead Sea Scrolls, which attest for the period around the middle of the third century BCE several different versions of the texts, including the proto-Samaritan version (Dušek 2012b: pp. 85–96). To this evidence we have to add the Septuagint that attests the dissemination of the Pentateuch amongst the Greek-speaking Jews in Alexandria, and Ben Sira, who canvasses the biblical tradition around 200 BCE in Judah. However, which circles were responsible for the production and tradition of the Hebrew Pentateuchal manuscripts or for the Greek translation of the Torah remains – apart from the ancient legends (Ezra 7; Neh. 8; Letter of Aristeas Judaeus; Joseph) – unclear. It is equally unclear in which circles these documents were copied, studied, and adhered to and what status the Torah had in Samaria (Mt. Gerizim), Judah (Jerusalem), and Alexandria during the Persian and early Hellenistic period (Kratz 2007, 2010, 2013, 2015).

We have to admit that we know far less about the history and status of the Pentateuch as Torah during the Persian period than we would like to and we are forced to rely on speculation. The Maccabean revolt during the reign of Antiochus IV during the middle of the second century BCE may provide a

historical starting point. Here the Torah is no longer a document of marginalized groups such as the religious community from Qumran but has started to play a significant role in the quarrel over political and economic influence between rival groups within Judaism. During the reign of the Hasmoneans it became (for the first time?) a political and legally binding document for entire Judaism. This is, however, a different story for which we would have to assess the sources for the Hellenistic period.

NOTE

- Becking, B. (2011). *Ezra, Nehemiah, and the Construction of Early Jewish Identity*, Forschungen zum Alten Testament 80. Tübingen: Mohr Siebeck. Concentrates mainly on Ezra-Nehemiah and the question of Judaeic or Jewish identity.

CHAPTER 11

Phoenician Sources

Josette Elayi

It is paradoxical that the Phoenicians who invented the alphabet have left relatively few inscriptions, compared with the Greeks for example. However, we know from the historian Flavius Josephus (see Chapter 14 Greek and Latin Sources) that Tyre used to write annals of the main events, as other cities probably did. In fact, hundreds of Phoenician inscriptions dated from the Persian period have been discovered, but most of them are very short. Monumental inscriptions are not frequent, on the one hand because many stones from ancient Lebanese sites have disappeared in lime-kilns, on the other hand because the Phoenicians probably used to write on perishable supports, not preserved due to humid and salty soils. The main difficulty in consulting Phoenician inscriptions is the absence of a global corpus. Only partial corpuses exist for some categories of inscriptions and most Phoenician inscriptions are scattered in various publications or remain unpublished (Donner and Röllig 1973: pp. 10–62; Gibson 1982: pp. 93–141; Elayi and Sapin 2000: pp. 113–123, 363–366, 463–465, 609–611, 689–690; Pisano and Travaglini 2003: pp. 59–79).¹

The Inscriptions of the Four Main Phoenician Cities

Sidonian inscriptions are the most numerous, about 100. The longest (22 lines) is the funeral inscription carved on the sarcophagus of King Eshmunazor II, an important historical inscription, dated about 550–525

A Companion to the Achaemenid Persian Empire, Volume I, First Edition.

Edited by Bruno Jacobs and Robert Rollinger.

BCE (Elayi 1989: pp. 37–79). The funeral inscription of his father, King Tabnit, is slightly earlier. More than 25 foundation inscriptions of King Bodashtart were discovered in the Eshmun temple near Sidon, dated about 525–500 BCE (Bonnet and Xella 2000: pp. 93–104). Bodashtart also made an inscription for inaugurating the Saltani channel (Xella and Zamora 2004: pp. 273–300). Among several votive inscriptions, the inscription of King Baalshillem II gives his royal genealogy: Baalshillem I, Abdamon, Baana, and Baalshillem II (Stucky 2005: pp. 273–318). Monetary inscriptions must not be neglected because they are very useful for history and chronology. They give the kings' abbreviated names and their yearly dating between 401 and 333 provides the dates of the reigns: Baalshillem II (401–366), Abdashtart I (365–352), Tennes (351–347), Evagoras (?) (346–343), and Abdashtart II (342–333) (Elayi and Elayi 2004: pp. 437–470; Elayi 2006: pp. 14–21). Other Sidonian inscriptions are ostraca, magical squares, workshop marks, and graffiti.

There are approximately 50 Tyrian inscriptions, but almost all of them are very short. Among the votive and funeral inscriptions, one dated about 532 BCE possibly gives the names of the kings Hiram III and Ittobaal IV, another mentions the “chief of the hundred,” and two written in Punic on stelae are related to Carthago's sons (Sader 2005: pp. 80–84). The monetary inscriptions give the abbreviated names of some kings such as Ozmilk, who reigned from about 349 to 333 BCE (Elayi and Elayi 2009: pp. 221–252; Elayi 2006: pp. 21–25). Other Tyrian inscriptions are inscribed on gold, lapis-lazuli, and bronze amulets, tokens, bullae, fiscal, and personal seals (Lozachmeur and Pezin 1994: pp. 361–371; Bordreuil 1986: pp. 82–86; Sader 1990: pp. 318–321).

For Byblos, about 30 inscriptions have been published. Three are funeral inscriptions for King Shipitbaal III's son dated about 500 BCE, for an anonymous king dated about 400 BCE, and for Batnoam, King Ozbaal's mother, in about 400 BCE. The most important one is the votive inscription of King Yehawmilk dated about 450 BCE (Elayi 2009: pp. 14–23). The monetary inscriptions provide the names of four kings: Elpaal, Ozbaal, Urimilk, and Aynel. A magic inscription on a silver amulet possibly gives the name of King Shipitbaal III (Lemaire 2003: pp. 155–174). Other Byblian inscriptions are carved on statues, pottery, and seals.

The inscriptions of Arwad, Amrit, and Tartous opposite the island are still less numerous. Some inscriptions from the sanctuary of Amrit (Maabed) are devoted to the healing god (Puech 1986: pp. 327–342). The monetary inscriptions give the abbreviated names of some kings such as Gerashtart, who reigned from 339 to at least 333 BCE (Elayi 2007: pp. 99–104). Lead weights from Arwad, Amrit, and Tartous bear some short inscriptions of values, useful for metrology (Elayi and Elayi 1997: pp. 155–181).

Other Inscriptions from the Levantine Seashore

With the exception of Amrit and Tartous inscriptions, the Phoenician inscriptions are rare and very short in northern Phoenicia, at Al Mina, Ras el-Bassit, Ras Shamra, Tell Kazel (ancient Simyra), and the Nahr el-Barid. About 20 short inscriptions were discovered in Beirut, mainly ostraca, graffiti, and weights (Sader 1998: pp. 203–213). Several inscriptions come from the excavations of Sarafand (ancient Sarepta): a letter, an abecedary, seals, and votive inscriptions, one of them inscribed on an ivory tablet dedicated to Tanit-Ashtart. Not far from Sarepta, at Kharayeb, another votive inscription on a statue was found.

In southern Phoenicia, many inscriptions were discovered during an extensive archaeological exploration. However, almost all of them are short and not very significant (Delavault and Lemaire 1979: pp. 1–37; Lemaire 2000: pp. 97–113). Some very short inscriptions on ceramics were found in Tell Keisan and a fiscal seal is related with this area. Some ostraca come from Akko, one of them mentioning the order given by the political power to the metal workers to make 302 cultic vessels for the temple. Several short inscriptions on jars, ostraca, graffiti, personal, and fiscal seals were discovered in Tell Abu Hawam, Haifa, Shiqmona, and Atlit. Ostraca from Dor mention the name of an official from Sidon and a list of agricultural tools. Coming from the area of Elyakhin in the Sharon plain, metallic bowls bear several votive inscriptions. Some short inscriptions were found in Apollonia-Arsuf, Tel Michal, Jaffa, Ashkelon, and Gaza: inscriptions on jars, ostraca, graffiti, and weights.

Inscriptions from Cyprus

Many inscriptions, some of them very important, were found in all areas of the island of Cyprus, which was part of the Persian Empire. The most significant are the economical archives of the palace of Idalion, most of them still unpublished. It is the only existing epigraphic source for the Phoenician economy. There are at least 270 Phoenician inscriptions: gypsum tablets, ostraca, and “labels” (Sznycer 2004: pp. 86–100). The 156 inscriptions found in Larnaka (ancient Kition) are published: funeral and votive inscriptions, ostraca, inscriptions on pottery, and mainly temple tariffs (Amadasi and Karageorghis 1977: pp. 11–189). A votive inscription from Larnaka-tis-Lapithou (ancient Lapethos), carved on a marble stone, is dated between 345 and 315 BCE, possibly under the reign of King Praxippos II. Another votive inscription from Lapethos, dated from the fourth century, is bilingual (Phoenician and Greek). A commemorative inscription of Milkyaton, king of Kition and Idalion, found in Tamassos, gives information on a victory against the Paphians in 392/391 BCE. A sarcophagus bears the inscription of Eshmunadon, governor of Tyre,

dated from the fourth century. Various other inscriptions, in general short, come from Vouni, Kourion, Alassa, Ayia Irini, Athienou (Golgoi), Pergamos, and Salamis (Masson and Szzyrmer 1972: pp. 86–128).

Other Inscriptions from the Persian Empire

In the other parts of the Persian Empire, the Phoenician inscriptions are much less numerous. In Syria, inscribed weights come from Homs and a short inscription dated from the fourth century was found in Karkemish. In Israel, ostraca, bullae, short inscriptions, and stamps on pottery were found in Hazor, Khirbet el-Kom, Wadi Daliyeh, and Sichem. A bronze situla from Har Mispheh Yamim bears a votive inscription to Ashtart. The ostraca of Tell el-Kheleifeh near Elat testify to Phoenician trade in the Red Sea during the Persian period. Small Phoenician inscriptions were also discovered in Egypt: in Memphis, Tell el-Maskhuta, Abusir, and Elephantine.

There are several inscriptions which originate from antiquities markets whose provenance is unknown. Some Phoenician inscriptions dated from the Persian period were also found outside the Persian Empire, in the Greek world and in the western Mediterranean. In the Near East, the great number of inscriptions dated from the Persian period shows that writing was widespread during this period, and not only reserved for professional scribes. The graffiti on pottery and coins were made by anybody who had an appropriate writing tool available. Most of the inscriptions are engraved on hard supports such as stone, metal (bronze, lead, silver, gold), ivory, and ceramics. A few only were painted in black or red on pottery. In general, the writing has a cursive character, except in monumental inscriptions which are not numerous. The monumental inscriptions are votive, funeral, or commemorative; none is a political decree, so numerous in Greek cities. Other categories of inscriptions are economical (archives, tariffs, lists), fiscal, monetary, magical, personal seals, indications of ownership, weights, letters, workshop marks, tokens, bullae, abecedaries ... As no corpus of all the Phoenician inscriptions from the Persian period exists as yet, and since their historical information is scarce and scattered, it is necessary for the historian to use them extensively, but as a complement to other kinds of sources.

NOTE

- 1 A project has been conceptualized to assemble all the Phoenician inscriptions of the Persian period, together with other texts and categories of documentation, on the website of P. Briant at the Collège de France: www.achemenet.com. The part concerning the Phoenician inscriptions has not yet been performed.

CHAPTER 12

Egyptian Sources

Günter Vittmann

Most of the contemporary evidence for the First Persian Domination (27th Dynasty, 526–404/1 BCE) in Egyptian language is datable to the reigns of Cambyses and above all Darius I. A naophorous statue in the Vatican Museum had probably been set up by its owner Udjahorresnet in the temple of the goddess Neith in Sais in the Western Delta (Kuhrt 2010: pp. 117–122; Vittmann 2003: Pl. 15; here Figure 12.1). According to the inscriptions of this monument, Udjahorresnet played a fundamental role in integrating the conqueror Cambyses into traditional Egyptian royal ideology by establishing for him a pharaonic titlature and introducing him into the Temple of Sais to represent him as a pious ruler who respected Egyptian state religion. This image is also conveyed by a seal impression from Buto in the Delta which designates him as beloved by the goddess Uto (Kuhrt 2010: p. 127). The official epitaph issued in the name of Cambyses for the deceased Apis bull and the sarcophagus of the latter were discovered in the Serapeum at Saqqara (Kuhrt 2010: pp. 122–124). The classical tradition according to which Cambyses killed an Apis is neither confirmed nor contradicted by Egyptian sources, but some texts contain allusions to serious troubles at the beginning of the Persian conquest (Jansen-Winkel 2002). A Demotic papyrus from the Ptolemaic period depicts Cambyses as having heavily restricted the revenues of the temples (Kuhrt 2010: pp. 125–126). Cambyses is mentioned in some Demotic legal documents from Assiut concerning the conveyance of priestly offices and possessions within a family from the time of Amasis down to the reign of Cambyses (Spiegelberg 1932: pp. 39–53; Shore 1988).

Figure 12.1 Vatican, Museo Gregoriano Egizio: Naophorous statue of Udjahorresnet. Source: Drawing by the author.

The long reign of Dareios I is represented both by monumental inscriptions and by administrative documents. Three large stelae with multilingual propagandistic texts were erected at the occasion of the building of a canal through the Red Sea near Tell el-Maskhuta, Kabrit, and Suez (Posener 1936: pp. 48–87; Kuhrt 2010: pp. 485–486). A large, now headless statue of the king (Kuhrt 2010: pp. 477–482) had been made in Egypt and, before it was transported to Susa, placed in a temple (Heliopolis? Pithom?) “in order that he who will see it should know that the Persian man holds Egypt,” as the Old Persian text puts it. The hieroglyphic version avoids this provocation, preferring instead to stress the adaptation of the Achaemenid ruler to Egyptian royal ideology.

The large temple of Amun in Hibis (Kharga Oasis) was decorated under this ruler (Lippert 2016; *here* Figure 12.2), and his cartouche can also be seen in the sanctuary of the temple of Qasr el-Ghueita in the same area (Darnell 2007). In general, however, royal involvement in building and decoration of temples and cultic activities outside Kharga and Dakhla (Amheida) is extremely

Figure 12.2 Relief of Dareios I offering milk to Amun in his temple at Kharga. Source: Reproduced by permission of Günter Vittmann.

scarce and modest: there is little more than two isolated blocks in Busiris and Elkab (Vittmann 2003: Pl. 19a), a fine painted wooden naos from Tuna el-Gebel/Hermopolis (Mysliwiec 1998: Pl. 9.1–9.2), and minimal traces of work at Karnak (Traunecker 1980).

Egyptian officials who were active under Dareios I include Udjahorresnet, the treasurer Ptahhotep and the overseer of works Khnemibre. According to the inscriptions on his statue, Udjahorresnet spent part of his life at the court of the king in Elam (i.e. Susa), where he was appreciated for his abilities as a physician (Kuhrt 2010: p. 119). The exact date of his return to Egypt is unknown, but his tomb, which had been built at the end of the 26th Dynasty, was discovered in Abusir (Bareš 1999). Ptahhotep, whose tomb was unearthed in Giza in the nineteenth century, is well known for his Brooklyn statue that depicts him in the habit of a Persian official (Vittmann 2003: Pl. 14 b–c), and an inscription that assigns to him the non-Egyptian term *qppš*, which has been linked with the tradition about the faithful eunuch Kombabos (Posener 1986; Briant 1996: p. 283). As to Khnemibre, hieroglyphic graffiti in the quarries of Wadi Hammamat in the Eastern desert attest his career as an overseer of the royal building projects for a period of nearly 35 years, from the end of the 26th Dynasty down to year 30 of Dareios I (492 BCE; Posener 1936: pp. 88–116).

Numerous stelae attest the burials of three Apis bulls during the reign of Dareios I; for the first of them the official epitaph from year 4 (518 BCE) is

preserved (Posener 1936: pp. 36–41). For the Apis bulls that continued being installed and buried under the later Achaemenids any direct inscrip-tional evidence is lacking; there is, however, a damaged mention of Artaxerxes I in the context of events regarding the “Mothers of Apis” (Smith et al. 2011: pp. 15–25).

A small stela in Berlin shows Dareios in the form of divine falcon adored by a private individual, a unique example of presumably posthumous divinization of this ruler (Burchardt 1911: pp. 71–72; Vittmann 2003: fig. 60). Particular esteem of Dareios, though on a more mundane level, is demonstrated by a text on the verso of the so-called Demotic Chronicle: there, Dareios I is presented as a king who had the earlier laws of the Egyptians until year 44 of Amasis (527 BCE) systematically collected (Kuhrt 2010: p. 125 [b]).

Many Demotic administrative documents are dated to the reign of Dareios I, among them an archive from Thebes that concerns the private affairs of funerary priests in the period from Amasis to Dareios (Pestman and Vleeming 1994). A famous papyrus, the copy of the lengthy draft of a petition which was to be submitted to a high official of Dareios, vividly describes the vexations suffered by an Egyptian temple scribe at the hands of the local clergy when trying to recover the prebends that had been snatched away by the priests from his ancestors in the past (Vittmann 1998; Hoffmann and Quack 2007: pp. 22–54). An important group of papyri is formed by the so-called correspondence of the satrap Pherendates from Elephantine, which illustrates the concern of the Achaemenid authorities for the administrative and economic aspects of an Egyptian temple (Kuhrt 2010: pp. 852–854; Martin 2011: pp. 288–292). Another letter of identical provenance sheds some light on the unrests in this area which may have been connected with the rebellions that took place at the end of Dareios’ rule (Martin 2011: pp. 295–296).

As for the successors of Dareios I, Egyptian sources from the Nile valley are extremely rare. Xerxes and Artaxerxes I are mentioned in some hieroglyphic graffiti in the Wadi Hammamat left by two high Persian officials of the local administration (Posener 1936: pp. 120–128; here Figure 12.3). Whereas there are some Demotic papyri that can be assigned to the rule of Artaxerxes I (Devauchelle 1995: pp. 38–40; Smith and Martin 2009: pp. 31–39, with interesting prosopographic connections with Aramaic documents), there is no papyrological evidence at all for Xerxes. An inscription from the early years of Greek rule, the so-called “satrap stela,” depicts him as an impious ruler of the past who seized property of the Egyptian gods but was finally expelled by them from his palace, together with his son (Schäfer 2011: pp. 146–151). Dareios II is the king into whose reign two fragmentary Demotic papyri from Saqqara with official reports can be dated (Smith and Martin 2009: pp. 24–31). Over the last two decades, however, several hundreds of Demotic ostraca were discovered in Ain el-Manawir (Kharga Oasis), many of them

Figure 12.3 Graffito of the Persian official Athiavahya from year 28 of Xerxes in the Wadi Hammamat. Source: Reproduced by permission of Kurt Tausend.

dating to the latter half of the First Persian Domination (Artaxerxes II, Darcios II). These documents from the area of the temple of Osiris-Iu, a local form of Osiris, testify to the continuity of cultic and religious activities in this period, and concern various aspects of public life such as water rights and agriculture. One ostrakon is particularly interesting because of its date, “year 2” of a prince Inaros. Whatever the correct reading of his title (Chauveau 2004 “great one of the rebels”; Winnicki 2006 “great one of the Bakales,” a Libyan tribe), he is most probably to be identified with one of the two(?) fifth-century rebels named Inaros that are known from Aramaic and Greek sources.

A first edition of these ostraca by Chauveau and Agut-Labordère is now available on the Achemenet site (www.achemenet.com; for a preliminary report see Chauveau 2011).

For the Second Persian Period (340/39–32 BCE; for the former date see Depuydt 2010), the only Egyptian sources that can be attributed to this period are some coins with the name of Artaxerxes (III) in Demotic (Kuhrt 2010: p. 413, Fig. 9.8) and a contract concerning a house division from the reign of Darcios III (Cenival 1966). There are, however, some hieroglyphic inscriptions that might possibly refer to events of that period: Petosiris, a high official in the administration of the temple of Thoth at Hermopolis, alludes to the troubles that befell Egypt (Kuhrt 2010: pp. 460–461). An inscription from the time of Philippus Arrhidaeus reports the rescue of the corpses of the sacred falcons that had been profanated by the “foreigners,” presumably the Persians toward the end of their rule (Sherman 1981: p. 90). Like Udjahorresnet some two centuries earlier, Somtutefnakhte, a priest of Harsaphes in

Herakleopolis, spent a certain time of his life outside Egypt: the inscriptions of the so-called “Naples stela” probably allude to the battle of Issos (333 BCE, Kuhrt 2010: pp. 458–459). It should not be forgotten, however, that all these documents that have been brought in connection with the Second Persian Period never mention the king by name, which leaves some doubt concerning the reliability of the current ascriptions.

The exact date of Chababash, an ephemeral Egyptian “anti-king” in the last years of the Second Persian Domination, is unknown (Depuydt 2010: pp. 192–193; Vittmann 2011: p. 410; Schäfer 2011, *passim*).

CHAPTER 13

Lydian, Carian, and Lycian Sources

Ivo Hajnal

Persians on Lycian, Lydian, and Carian Inscriptions

In 541 BCE, Cyrus II conquered the Lydian domain and formed the satrapy of Lydia. This marked the end of independence for the small states of south-west Anatolia. With regard to the epigraphic sources, however, the Iranization of the epichoric societies seems to be limited:

- The Lycian inscriptions and coinage provide 16 anthroponyms that plausibly are of Iranian origin. Only nine of these belong to persons related to Lycia itself, who, for example, act as dynasts or are mentioned as builders of steles or graves.
- The Lydian inscriptions prove only four anthroponyms that are of certain Iranian origin. They demonstrate that bearers of Iranian names took part in local life and assumed central positions. For example, a certain Mitridasta-, son of Mitrata-, was a priest in the Artemis temple of Sardes.
- The Carian inscriptions do not show any direct traces of Iranian influence.

Historic and Prosopographic Notes on the Lycian Evidence

The Lycian inscriptions permit most conclusions on Achaemenid presence in the pre-Hellenistic period. The relevant inscriptions are presented below in chronological order.

a) The “Xanthos Stele” (TL 44; around 400 BCE)

The most important source of local history is the so-called “Xanthos Stele” (TL 44) – a tomb pillar (or possibly the pillar of a cenotaph) that bears three texts in Lycian, Milyan (“Lycian B”), and Greek. The timeframe of these texts reaches from about 430 BCE until 395 BCE. The texts present the honored dynast’s achievements for the community as well as his military successes. The following passages refer to the Achaemenid presence in the region:

- TL 44a.36 et seq. mentions the Lycian and “Median” cavalry in parallel (*esbedi hēmenedi trñmil[ije]di se medezedi* “with the *h.*, Lycian and Median cavalry”).
- TL 44a.51 et sqq. refers to the Ionian War. TL 44a.54 et seq. mentions the military conflict with the army of Humr̥χ̥χa (*ese Humr̥χ̥χā tebāna terñ* “to defeat *H.* [and] his army”). Humr̥χ̥χa can be identified as Amorges, who with the help of Athens continued the Carian revolt his father Pissouthnes had instigated. In 412 BCE, the satrap and his allies from Sparta and Syracuse managed to arrest Amorges in Iasos (*Ijāeusas* TL 44a.52). The whole passage suggests Lycian participation in the coalition to arrest Amorges.
- TL 44b.58 et seq. refers to provisions (*azzalāi*) by Darius II and his successor Artaxerxes II, the Lycian author obviously calling himself their patron or supervisor. The passage in question is in the context of the arranging of sacrifices and the building of monuments. Furthermore, the whole part of the inscription on the eastern page of the stele (TL 44b) appears to refer to the continuation of the Ionian war. This can be concluded from the common mentioning of the satrap, of Sparta, and of Athens in TL 44b.26 et seq., and from the reference to a trireme from Chios TL 44b.22 (*trijerē kiježē*).
- TL 44c.1 et sqq. indicates that during the Carian revolt of Amorges (see above), the Lycian author was employed as a negotiator in the coalition between the Persians under the leadership of Kizzaprñna (Tissaphernes), son of Widrñna (Hydarnes), and the Spartans. The subsequent reference to Erijamāna in TL 44c.12 (probably Ἰερραμένης, also known from Thucydides as a negotiator between the Persians and Sparta) has the same historical context.

- TL 44c.13 et seq. mentions a stele or a monument that the author erected for “Tissaphernes and the Persians” (*ñtube ter[e] kizzaprñna epriti se parza meñ[ne] t[a]mā axa*).

The Xanthos Stele thus confirms from a local viewpoint what is stated in other sources (e.g. in Thucydides). The author of the inscription apparently seeks to document the close relationship of his dynasty with the Achaemenids after the split between Lycia and Athens. The Xanthos Stele at the same time marks the beginning of the decline of the dynasty of Xanthos.

b) **Arttuñpara (380–370 BCE)**

The end of the dynasty of Xanthos is closely connected with the rise of the eastern Lycian dynast Perikle (approximately 380–360 BCE). Directly connected with Perikle is Arttuñpara. His status has not yet become fully clear: It may well be assumed that Arttuñpara was a western Lycian dynast. However, it has been alternatively proposed that Arttuñpara was a Persian official (such as a governor). This is supported by a coin minted in Side, Pamphylia, which refers to Arttuñpara. Although it cannot be excluded that a Lycian dynast had coins produced outside Lycia, too, minting coins outside the ruled territory would have been easier for a Persian official. The other sources permit the following statements: Arttuñpara was at first active in western Lycia, since the only coins minted by him within Lycia are from Telmessos. But the inscriptions tell that he subsequently became an opponent of Perikle:

- TL 11.2 et seq.: The base of a sarcophagus from western Lycian Pinara contains the dating phrase *trñmisñ xñtewete ter[i] arttuñpara* “when Arttuñpara ruled over Lycia.” This phrase indicates a rule of Arttuñpara that extended across western and central Lycia.
- TL 29.7: The epitaph from western Lycian Tlos mentions military achievements of its builder, Ikuwe: this includes the takeover (?) of an institution (?; *wazzis*) from Edrijeus (Idrieus), the later Carian satrap from 351–344 BCE (TL 29.5 *ñtepi wazzisñ xalxxa edrijeusehñ*). The text then mentions Arttuñpara as the overseer of the Medians (TL 29.7 *arttuñpara medese pddatiti erije*).
- TL 104b: The inscription from eastern Lycia mentions the defeat of Arttuñpara against Perikle: TL 104b *tebursseli prñnawate (2) gasabala êke ese perikle (3) tebete arttuñparā se ñparahe (4) telēzijē* “Tebursseli, who built Gasabala (this facility) when Perikle defeated Arttuñpara and his army.” The inscription TL 104a, which is found on the same monument, also mentions an institution (?) *wazzis* created by Arttuñpara (see above on TL 29). The builder, Tebursseli, could therefore be a follower of Perikle, who achieved major military successes against Arttuñpara.

In summary, the inscriptions offer a picture that is quite clear and confirm what has been known so far: it appears Arttunīpara intended – be it as a Persian official or a Lycian dynast – to preserve the dominant position of the dynasty of Xanthos. But the rise of the eastern Lycian dynast Perikle appears to be unstoppable. At the latest after the conquest of the western Lycian city of Telmessos, which is reported by Theopompus (*Philippica*, F. 103.17), Perikle controlled all regions of Lycia within a short time span. The rise of Perikle around 370 BCE appears to be a signal for the satraps of western Anatolia to break away from the Persians. Subsequently, Lycia itself joined the Satraps' Revolt.

c) **Miθrapata (380–370^a)**

It is indicated by two epitaphs that Miθrapata ruled as a dynast in central Lycia around the same time as Arttunīpara (see b). Miθrapata is also mentioned on many coins from central and eastern Lycia, the portraits on which show a quite different style from those of the dynasts of Xanthos. The parallel and complementary character of the functional spheres of Arttunīpara and Miθrapata have led to the thesis that Miθrapata was a Persian official just like Arttunīpara. According to this thesis, the Achaemenids kept western Lycia and central/eastern Lycia under control through two of their officials before the takeover by eastern Lycian dynast Perikle. However, this scenario must remain speculation.

d) **Wataprddata (391–c. 350^a)**

Wataprddata (Autophradates) was the satrap of Lydia under Artaxerxes II. At the beginning of the Satraps' Revolt in 370^a, he is on the side of the king of kings and intervenes against the Cappadocian satrap Datames. Two Lycian inscriptions are important in his regard:

- TL 61.2: This epitaph from eastern Lycian Phellus is dated *ēñēχñtawata wataprddatehe*. Dating with reference to a satrap is conspicuous. It indicates that the inscription was written after the fall of Perikle.
- TL 40d.1 et seq.: This inscription, which is found in Xanthos on the sarcophagus of Pajawa, calls Wataprddata a Persian satrap and attributes to him a *χruwata* – possibly a religious donation – to the builder Pajawa/the sarcophagus (*ebeija [χr]uwata: meije pijetē wat[aprd]ata χssadrapa pa[r-z]a*). Obviously, Pajawa is a follower of the satrap, given that the sarcophagus shows an image of an oriental audience.

The Lycian texts referring to Wataprddata obviously presuppose the end of Perikle's rule and the quelling of the Satraps' Revolt in 362^a. This marks a new epoch for Lycia: the transfer under direct Carian control.

c) The Letoon Trilingual (N 320)

The Lycian-Aramaic-Greek Trilingual from the Letoon of Xanthos reflects the new, “Carian” epoch of Lycian history. Although it does not contain any direct references to Persia, it offers indirect indications of Lycia’s status and its society after the fall of Perikle. The Trilingual can be dated to 358^a or alternatively to 337^a and thus to the first year of the reign of Artaxerxes III or Arses/ Artaxerxes IV, resp. It contains the decision of the Xanthians and “perioeci” (*epewētlm̃m̃i* or *περιοίκοι*) to install a cult for the “Kaunian King” (*χ̣ñtawata x̣bideñni* or *βασιλεύς Καύνιος*) and for a certain Arkesimas, who is by the way not explicitly mentioned in the Aramaic version. In this connection, the Carian satrap Pixodaros (*Pigesere* or *Πιξώδαρος*) appoints two archonts with power over Lycia. The political constellation seems relatively clear: a different balance of power enables the Carian satrap and dynast to install trusted followers as archonts and to establish a Carian cult. Remarkable is the fact that the Lycian and Greek versions call Pixodaros a satrap of Lycia (N 320.1 et seq. *ēke tr̃m̃m̃isñ x̣ssaθrapazate pigesere*) while the Aramaic version calls him a satrap of Caria and Lycia (ḤŠTRPN’ ZY BKRWTRMYL). Assuming that the Aramaic version reflects the official Persian view, the double mentioning is another piece of evidence for the submission of Lycia under the control of the Carian Hecatomnid dynasty. Quite generally, the differences between the Lycian and Aramaic versions provide insight into the different perspectives of local and state administration. The rules stated on the Trilingual to secure the financing of the cult also provide valuable indications on the structuring of autonomy in the Persian Empire.

Conclusion

Even though Lydia, Caria, and Lycia have strategic and economic importance for the Achaemenids, the epichoric sources do not provide many insights at first glance. This may on the one hand be due to the random nature of tradition, but on the other hand also to the social standing of the indigenous languages: in a multinational and multilingual society like the Persian Empire, the role of indigenous languages is limited to the rendering of locally relevant facts and to private communication.

The relatively favorable evidence in Lycia illustrates that this local perspective is not lacking attractiveness. The Lycian inscriptions provide insight into a century of Lycian-Persian relations that are quite variable on a political and social scale. They tell primarily of changing coalitions and conflicts among the local elites, from which Achaemenid politics does not always refrain.

In summary, this is why the sources in epichoric languages often constitute a complementary supplement to the standard sources of Achaemenid history.

They provide both local confirmation of historical developments and valuable close-ups of social and cultural history.

CHAPTER 14

Greek and Latin Sources

Reinhold Bichler and Robert Rollinger

Introduction

For a very long time, the reconstruction of the history of the Achaemenid-Persian Empire was mainly based on classical sources. These sources created successful master narratives that primarily focused on the Persian Wars at the beginning of the fifth and on the downfall of the empire at the end of the fourth centuries BCE. Although these sources altogether originate from the western fringes of the empire presenting a biased view on the Greeks' eastern neighbors, our view of the Achaemenid-Persian Empire is still considerably determined by these sources and their perceptions of the Persians. In the last 35 years a considerable change of perspective took place among specialists, giving way to a much more critical approach in evaluating these sources. Although there is still some disagreement about the adequate place of these sources within a modern history of the Achaemenid-Persian Empire (Harrison 2011), it can hardly be doubted that they are of inestimable value for any reconstruction of Achaemenid-Persian history.

From the Eve of the Persian Wars to the Peloponnesian War

Greek perceptions of the Persians had initially been closely intertwined with that of the Medes. Their power had extended eastwards of the territory of the Lydians. The expansion of the Persian Empire under Cyrus II, who overran

the kingdoms of the Medes and the Lydians and affected the Greek cities in western Asia, was perceived as the sovereignty of “the Mede” (Xenophanes F 18 Diels). Also, the series of fights which took place in the aftermath of the Ionian Revolt (500/499 BCE) was referred to as *Medika* and the cooperation with the “enemy” was known as *Medism*. Still in 472 BCE an eponymous Medos appears as the first army leader of the Persians in Aeschylus’ tragedy *Persae* (765). But from Herodotus on (1.125.4; 7.61.3, 15.2; 7.62.1), the Persians are perceived as descendants of Perses or his father Perseus and the term *Medes* is linked with Medeia (Tuplin 1997; Rollinger 2003; Michels 2011; for all sources see Kuhrt 2007).

The ethnic groups and cities of the Persian Empire were first systematically treated about the time of the Ionian Revolt in Hecataeus of Miletus’ geography (*periodos ges*), the original of which is lost (FGrH 1). The introductory scene of Aeschylus’ *Persae*, performed in 472 BCE, still starts with a list of warriors and commanders of Xerxes’ army. The soldiers had been recruited from all over the empire (1–92) and the fleet counted 1207 ships (341–343), reminiscent of Homer’s *Iliad*. Thus, the victory against these superior forces appeared even more astounding. About two decades before, Phrynichus affected the Athenians with a tragedy that addressed the taking of Miletus by the Persians (Hdt. 6.21). After the Greek victory at Salamis (480 BCE), he also staged the misery of the defeated enemy in his *Phoenician Women*. But unfortunately, Phrynichus’ texts are lost. Simonides’ lyrical poetry is at least preserved in fragments. The most important parts refer to an elegy on the battle of Plataea (479 BCE) where the warriors are compared to the heroes of the Trojan War. Obviously, it was prestigious to partake in the glory of the winners of the Persian Wars by telling their story. Thus, in 470 BCE Pindar praised Hieron, city lord of Syracuse, as savior of Hellas’ freedom. His victories over Carthaginian, Phoenician, and Etruscan forces in the battle of Himera in Sicily and on sea at Cyme in southern Italy (480 and 474 BCE) were compared to those at Salamis and Plataea (Pythians 1.72–180). A new interpretation of the unexpected success in fending off Xerxes’ invasion was given by Aeschylus’ *Persae*. The young and imprudent king is misled by bad advisors. Overestimation of his gigantic forces leads to his defeat. The crossing of the Hellespont and sacrileges exhibit his hubris and bring about disaster (743–752, 807–812). The Athenians had already shown at Marathon (490 BCE) what men of free will were capable of doing against an army led by a despot (cf. 235–244). At Salamis, the freedom of Hellas was at stake (cf. 402–405). Xerxes instead had to fear that the peoples of Asia would no longer be prepared to bow to the Persian rule, pay tribute, and prostrate before the king (584–590) (Boedeker and Singer 2001; Bichler and Rollinger 2002; Föllinger 2009: pp. 53–76; Lenfant 2011).

With the ascent of Athens as a leading power in the Aegean, the recollection of the victory at Marathon, along with the fame of Salamis, began to gain importance. Huge monuments solemnize the victories of the past. At the same time, there is a fundamental change regarding the image of the Persians. The enemy now appears weak and wimpish and at times even disparaged in scenes of the genre (Miller 1997; Miller 2002). With the outbreak of the Peloponnesian War (431 BCE), the question of diplomacy in regard of the Persian Empire gained momentum. Aristophanes' first preserved comedy, the *Acharnians* (425 BCE), evokes the stereotypical images of Persian luxury and indulgence. It warns against the dangers of getting involved in diplomatic and political relations with the former enemy. In the last years of the Peloponnesian War the treaties which had been signed in 412 BCE by Sparta and the Great King proved to be disadvantageous for Athens. Probably it was then that the *Persians* by Timotheus was performed, a lyrical piece that told about the battle of Salamis to the accompaniment of the *kitara*, giving a rather disdainful impression of the Persians (Schmal 1997; Hutzfeld 1999; Huber 2002; Madreiter 2012).

Of crucial importance for the further development of the image of the Persians was the prose-style writing of the last decades of the fifth century BCE. Unfortunately, very little testimonial evidence of the first *Persica* survives – from Dionysius of Miletus (FGrH 687) to Charon of Lampsacus (FGrH 687b) and Hellanicus of Lesbos (FGrH 687a).

The same counts for the fragmentary parts of the portrayals of political leaders dealing with Persia by Ion of Chios (FGrH 392) and by Stesimbrotus of Thasos (FGrH 392). A prose treatise which was probably written in the last quarter of the fifth century BCE and is still preserved in the corpus of the Hippocratic writings played a specific role in creating the cliché of despotism in Asia. The unknown author of the treatise on *Airs, Waters, Places* underlines the role of the environment for the physical and mental condition of the inhabitants of a certain area. According to him, the soft Asian climate played an important role in fostering the despotic reign so typical of the Asian continent, whereas the spirit of freedom that prevailed in Europe was due to the harsher living conditions in this part of the world (*Airs, Waters, Places* 16; 23). Those who proved to be the bravest among the inhabitants of Asia were the ones who did not happen to live under the rule of a despot but who lived autonomously, no matter whether they were of Hellenic or Barbaric origin (16.5.). Later on, Aristotle changed this schematic view, reinforcing the antithesis between Hellenic and Barbaric tribes (*Politica* 1327b 23–33; 1285a 19–22) (Jouanna 1996).

One of the most important accounts of the Persian Empire ever written appears with the *Histories* of Herodotus. The main line of his narration concentrates on the rise and later fate of imperial power in Asia which threatened the

world of autonomous Greek settlements and entangled the Greeks in a series of bloody wars. The fatality of an imperial policy is demonstrated impressively in the story of the Persian kings, ranging from Cyrus to Xerxes. Thanks to the gradual expansion of their empire, Herodotus had the possibility of giving account of the customs and conventions of the many different peoples of the world, including in his considerations the stories of the former kingdoms of the Lydians, the Medes, the Babylonians, and the Egyptians. The power of the Persian Empire seemed to have reached its apogee under Darius I. From this point onward, the conflicts between the Greek and Persian worlds began to gain increasing importance. Herodotus depicts the Persian Wars as a set of related events starting with the Ionian Revolt and ending with the success in fending off Xerxes' invasion army. His account of events ends when the Athenians begin to extend their power over the Aegean after their victories at Salamis, Plataea, and Mycale in 480 and 479 BCE, thus following in the footsteps of the Persians. He only briefly comments on the further history of the Greeks that was characterized by growing conflicts between Athens and Sparta, which had stood united against the external enemy. These conflicts culminated in the outbreak of the Peloponnesian War in 431 BCE. The famous events of the past assume the role of a teaching play, which serves as a starting point for assessing the tragedy of the current period from the point of view of Herodotus and his audience (Bichler 2000; Bichler and Rollinger 2011; Bakker et al. 2002; Dewald and Marincola 2006; Rollinger 2004 Degen 2017; Irwin 2013; Irwin 2017).

Herodotus' ethnographical accounts, especially those of Persian customs and conventions (cf. 1.131–140), are basically interpreted from a Greek point of view and give an ambiguous mirror image. The empire of the Persians is characterized by impressive resources. Its infrastructure, such as the network of roads and the messenger service, is astounding (5.52–54; 8.98). The Persians owed their power to a simple way of life that was organized according to strict rules (cf. 1.71, 89; 9.122), but the propensity of the elite to a luxurious lifestyle puts their attainments at risk. Nevertheless, scenes of luxury, intrigues, and harems at court, which are described excessively in later accounts, appear only rarely in Herodotus (cf. 3.130; 9.108–113). In spite of their luxury lifestyle, the Persians prove to be brave warriors even in defeat. Nevertheless, there is a tendency to interpret Persian kingship with its claim of universality and its supportive ceremonial, like the practice of *proskynesis* (bowing/prostrating oneself before the king), in a critical way. Herodotus' accounts of the Great Kings are quite differentiated. But there is a basic pattern of their misconduct. They break the rules and cultic commandments of their own society and tend to overestimate their own power while underestimating the enemy. Thus, they fail in all their megalomaniacal campaigns. But in this regard, the various tyrants and despots resemble each other, no matter whether they are of Non-Greek or of Hellenic origin!

Herodotus also describes a series of Persian characters of noble spirit, wisdom, bravery, and courage who are prepared to go as far as self-sacrifice (cf. 3.80.2–80.5; 83). Wise Persians warn against the dangers of hubris and deplore the human inability to avoid fatal events (cf. 7.10; cf. 7.18, 45–52; 9.16). At times, the Greeks are even put to shame through the example of the Persian kings. Cyrus condemns the dubious activities and the cheating that took place in the Agora (1.153). Darius I shows respect to foreign customs (3.38). Even a despotic ruler like Xerxes does not want to infringe legal principles such as the protection of envoys, in harsh contrast to the Athenians' misbehavior in the Peloponnesian War (7.134–137) (Bichler 2000; Dorati 2000; Jacobs 2003; Rollinger 2010).

From the Peloponnesian War to Alexander

The relationship between the various Greek communities and the Persian Empire in the subsequent period was characterized by acts of war as well as intensive diplomatic activities. In his accounts of the Peloponnesian War, Thucydides delivers the wording of three treaties that were signed in 412 BCE between Sparta and Darius II as well as the satrap Tissaphernes. This alliance changed the balance of power within Greece (8.18, 37, 58). An earlier alliance between Athens and Persia referred to by the rhetorician Andocides is debated in modern scholarship (*On the peace with Sparta* § 29) (Wiesehöfer 2006).

Thucydides' unfinished work was followed up by the first part of Xenophon's *Hellenica* (books 1–2) which describes the last phase of the Peloponnesian War and the following civil war in Athens (411–403/1 BCE). Its second part (books 3–6) comprises the events up to 362 BCE and exemplifies Sparta's attempts to hold a permanent supremacy in Greece. The Persian Empire is focused insofar as Greek politics are concerned – such as the wars in Asia Minor, Cyprus, and the Aegean or the King's Peace of 387/6 BCE. The anonymous *Hellenica Oxyrhynchia*, which were probably written a little bit later, are only fragmentarily preserved. They give further accounts of Sparta's campaigning in Asia Minor (400–394 BCE). However, for Artaxerxes II (404–359) another campaign, which had been launched in Asia Minor shortly before, appeared far more menacing. It was the rebellion of his brother, Cyrus the Younger, which came to an end in the battle of Cunaxa near Babylon with Cyrus' death (401 BCE). This event was crucial for the further Greek image of the Persian Empire thanks to two extremely heterogenic accounts, namely Ctesias' *Persica* and Xenophon's *Anabasis* (Tuplin 1993; Bleckmann 2006).

Ctesias of Cnidus wrote one of the most influential accounts conceptualizing the world of the Persian Empire as an “Orient” *avant la lettre*. Although his work *Persica* (originally 23 books) came down to us only through its use

by later authors, its textual structure and the literary talent of the author are still noticeable. The Persian Empire appears as part of a preceding line of empires ruling all over Asia that began with the Assyrians and continued with the Medes. However, like Herodotus, Ctesias conceptualized at the empire's eastern fringes a large sway of land that could not be conquered by the Persians or by their Assyrian predecessors. This land, which was dubbed "India" by the Greek authors, had access to incredible resources. Ctesias dedicated a small booklet to the description of this country. *Indica* depicts a seemingly ageless world and constitutes a counterpart to the monumental history of events of the *Persica* (books 7–23). Ctesias presented himself as an eye and ear witness, first as a physician of the king, Artaxerxes II, and his mother, Parysatis, and finally even as a successful diplomat (F 30). He saw the king's court as a dark center of power, but despite all their resources and their huge army, the kings themselves appear as rather weak. At court, influential advisors who are often depicted as eunuchs play a dominant role. Outside, the fortune of the empire depends on the loyalty of satraps and generals. Ctesias ascribed a special role to the royal women at court. Queens such as Parysatis, the mother of Cyrus the Younger and Artaxerxes II, as well as Amestris (Xerxes' widow) appear as dominant agents of intrigues and cruelty. There is controversy in modern scholarship as to whether Ctesias' accounts are related more to fact or to fiction. Their literary value is widely appreciated. Ctesias created dramatic scenes and impressive novelistic accounts. To present alternative stories to those of Herodotus was part of his literary program. How far he managed to draw on authentic folklore and local traditions is hard to tell (Bichler 2011; Wiesehöfer et al. 2011; Rollinger 2010; Waters 2020).

Writing *Persica* became popular in the fourth century BCE. The *Persica* by Dinon of Colophon, of which 30 fragments are preserved, require special mention. Like Ctesias, he created a kaleidoscopic picture of the Great King's court with its luxury and intrigues, but he tried to "correct" his predecessor in many points. He entered new terrain with the description of the reigns of Artaxerxes II and Artaxerxes III up to the reconquest of Egypt in 343/2 BCE. The *Persica* of Heraclides of Cumae, of which only seven fragments still exist, also include a series of elaborate accounts of the luxurious way of life at court and in the harem. These *Persica* had considerable influence on the works of later authors. This is especially true for the prehistory of the Persian Empire and the period from Artaxerxes I to Artaxerxes II, which was not treated by Herodotus any more (Lenfant 2009; Madreiter 2012).

An alternative, idealizing view of the Persian Empire was created by Xenophon. This already becomes obvious in parts of his first work, the *Anabasis*. The destiny of the Ten Thousand, the Greek mercenaries, who had taken part in Prince Cyrus' disastrous campaign against the Great King, were in the center of action. Although they had remained undefeated in battle, they

were forced to take a route through the territory of the enemy up to the Black Sea, after having lost their commander through a deceit of the satrap Tissaphernes. Thus, Xenophon had the chance to present his skills as a responsible officer. For him, Cyrus the Younger had been a model of prudent leadership and he set an impressive literary monument for him in his obituary (1.9). The Empire of the Great King (Artaxerxes II) was regarded with a certain distance. Tissaphernes, for instance, was given the prototypical role of a devious politician. The events around the battle of Cunaxa still disguise the perception of Tissaphernes' well-calculated policy of power as described in Xenophon's *Hellenica*. His rival, Pharnabazus, instead was portrayed as a noble character who was committed to his family tradition and the king, while being aware of the conflicts that went along with his loyalty (cf. *Hellenica* 3.4.5–4.6 with 4.1.29–1.40) (Tuplin 2004; Stoll 2013).

A literary analysis of prudent leadership can be found all along in Xenophon's works. However, in his *Cyropaedia* he projected all his ideals of military cautiousness and smart guidance, along with philosophical wisdom, economic understanding, and statesman-like awareness, onto one person. There Xenophon illustrates the development of a universal monarchy on a morally and institutionally stable basis exemplified by a mostly fictional story of the founder of the Persian Empire, king Cyrus the Great. Thus, at a time when Greece was divided by internal conflicts and the ascent of Philipp II of Macedonia was still not yet to be foreseen. According to the underlying logic, the main institutions that Herodotus attributed to Darius are presented as creations of Cyrus. His fairness in warfare, his clemency as a judge, and his moral integrity make him into a character worth admiring. Novelistic parts contribute to an oriental ambiance, but they lack the dark and brutal atmosphere so typical of the scenes at court in the contemporary *Persica*. Cicero fittingly referred to the *Cyropaedia* as an exemplary model of a "just rulership" (*iustum imperium: Ad Quintum fratrem* 1.1.23). Its reception history was striking, but its tendency toward idealization was equally noticeable. Plato's snappy critique hit the blind spot: the integrity of the state depended on the integrity of a king who was not capable of guaranteeing a good line of succession (*Nomoi* 3.694c/695b). Xenophon himself had not managed to get rid of the contemporary tendencies to hold contempt against the Persian Empire, for there lies a deep gap between the fictitious past and the author's own period, when the Persian Empire is characterized by a typical set of clichés including decadence and decline (final chapter 8.8) (Walser 1984; Flower 2017).

Similar clichés are employed in Isocrates' political rhetoric. In his *Panegyricus* (380 BCE) he suggested unleashing a new Persian War, unifying the Greeks under the leadership of Athens and Sparta. According to him, the education for servitude and the luxurious life of the Persian elite led to cowardice and

weakness among the Persian population. The satraps were said to be faithless, cowardly, submissive, and arrogant (c.f. esp. 123 f.; 149–155). Lastly, the prospect of rich treasures, namely the gems of Asia, were to spur on for battle (187). Half a century later, in 346 BCE, Isocrates urged Philipp II of Macedonia in a similar way to wage war against Artaxerxes III. In his eyes it was a shame that the Barbarians in Asia lived in greater prosperity than the Greeks. A new Persian War was to bring Philipp treasures and glory (*Philippus* 124–126, 132–137). Such clichés of Persian lifestyle were a useful tool for political agitation. Examples are also to be found in Demosthenes' speeches, however with an entirely different intention. There it is Philipp who was perceived as the more threatening “barbaric” enemy, and an alliance with the Great King became an attractive option. In this case, one should overcome the common clichés, stated the famous orator (cf. *Philippica* 4.31–4.34) (Marincola 2007).

An important contribution to Persian history within the frame of a Greek history was made by Ephorus of Cyme. His work, which originated in the time of Philipp II and made use of the different *Persica* of the fourth century is lost but was of great influence for later authors such as Diodorus and Strabo. Ephorus developed the idea that in 480–479 BCE Greece had been threatened by a unified attack of Persians and Carthaginians (FGrH 186 F 70). Unfortunately, the *Philippica* of Theopompus of Chios, written soon after Ephorus' work, are also lost. The author was admired and feared for his rigid moral judgments. The work focused on Philipp II but also concerned the Persian Empire of the fourth century and depicted the luxurious lifestyle of the Great King's court. When Alexander took up the military operation against the Great King already initiated by his father, the conquerors conceptualized the Persian Empire according to the conventional ideas developed by Greek tradition in the fourth century BCE (Marincola 2007; Parmeggiani 2014).

The classical authors' descriptions of Alexander the Great's campaigns are important but also problematic sources concerning the Persian Empire. They are of great importance for our knowledge about the empire's institutions and structures. This applies to the satrapies and their administration, for instance the structure of the army, as well as the king's court in the battlefield. Furthermore, we receive important data about the eastern parts of the empire of which little had been known until Alexander's conquest. The Alexander-historians mainly focused on the assessment of the personality of the conqueror. Thereby the Persian Empire serves as the setting for a dramatic story with a hero who is presented from different angles. The protagonists on the side of the enemy have a backstage role in a play concentrated on the successful conqueror, whereas Darius III (336–330) found his place in the shadow of Alexander (Briant 2003). The adaption of traditional Persian customs and court ceremonial by Alexander staging himself as the legitimate successor of Darius III (just as he claimed to be the successor of the Pharaohs in Egypt)

could be perceived as a sign of Alexander's growing hubris. With Callisthenes (FGrH 124), Alexander had brought along a historiographer who described his campaign as a Panhellenic war of revenge. The image of Darius fleeing prematurely and in a cowardly way both at Issus and Arbela (333 and 331 BCE) probably dates back to him, as does the account of the burning of Persepolis' palace as a deliberate demonstration of the successful revenge. Meanwhile, Callisthenes himself was sentenced to death (327 BCE). His critique of Alexander's taking over the ceremony of *proskynesis* was stylized as a memorial of Hellenic love of freedom (Briant 2003; Rollinger 2016; Ruffing 2017).

It was only after Alexander's death that an entire series of publications emerged, written mostly by companions of the king or at least by people who took part in the great campaign. All these accounts are preserved only thanks to their quotation in later works. This makes it difficult to determinate their chronological order and their reciprocal intertextuality. The staging of the military campaign in a fascinating way, exhibiting a world full of marvels and interesting encounters, started off relatively early with the novelistic work of Onesicritus. He is known for his marvelous tales about India where Alexander appeared as a wise man in arms (FGrH/BNJ 134 F 17) (Müller 2011; Winiarczyk 2011). The reception of the work of Nearchus (FGrH/BNJ 133) was also mainly due to his reports about India and his account about the passage of a fleet led by him from the mouth of the river Indus to the Persian Gulf. Most important for the image of the Persian Empire was the work of Cleitarchus, whose father Dinon had already become known through his *Persica*. Cleitarchus should better not be regarded an eye-witness. His history of Alexander with its flowery novelistic style found a great number of readers (FGrH 137). It is considered the main source of the historical tradition used by Diodorus, Trogus/Iustinus, Curtius (and partly Plutarch), referred to as *Vulgate*. There Alexander begins to develop increasingly despotic traits along with his victories over Darius III, whereas in comparison with the accounts of Plutarch and Arrian, his enemy is described as a far more noble person. The latter authors both give a rather euphemistic and idealizing account of Alexander's personality. With the work of Ptolemy (FGrH 138), Arrian had deliberately chosen an adequate main source. While recalling Alexander's great deeds, Ptolemy managed to bring in the appraisal of his own merits and, what was more, he also managed to find a way of legitimizing his political ideas in the later struggle for power after Alexander's death. The crucial question of priority between the writings of Cleitarchus and Ptolemy cannot be definitely decided although a recently published papyrus (POxy LXXI, 4808) suggests a later date for the former. Arrian's second important source, Aristobulus' history (FGrH/BNJ 139), is considered the latest report of one of Alexander's companions. It also presented an idealistic image of Alexander and described the marvels of the remote countries in the east (Gilhaus 2017).

From the Hellenistic Age to the Roman Empire

The main focus of Hellenistic historiography was concentrated on the wars in the aftermath of Alexander the Great, the development of the Hellenistic empires, as well as the ascent of the Roman Empire in the west and the emergence of the Parthian Empire in the east. However, one can still find some substantial information about the Achaemenid Empire. There is, for instance, Polybius with his polemic about Callisthenes' account of the battle at Issus (12.17–22) and his description of the city of Ecbatana and its temple of Anahita (10.27; c.f. Berossus' *Babyloniaka* F 12 BNJ). The *Oeconomica* which are (incorrectly) attributed to Aristotle present a short overview of the earnings and the financial administration of the Achaemenid Empire (2.1.1–1.4). But the decisive challenge to deal with the ancient Persians was the rise of the Roman Empire, its victory over the Macedonian successors, and the confrontation with the Parthians (Walbank 1957/1967/1979).

Therefore, seminal information is preserved by writers of universal history, starting off with Diodorus. He was born in Sicily and after the middle of the first century BCE he went to Rome and published the result of his comprehensive studies, the *Bibliothēke* (40 books). Parts of this opus have been preserved completely (1–5; 11–20) and some only in fragments. The history of the Persian Empire was treated according to the perspectives of Greek history both from a thematic and from a chronological point of view. Book 17 contains the earliest history of Alexander the Great so far preserved (with a gap concerning the period from 329 to 327 BCE), mainly based on the *Vulgate*. Herodotus, Ctesias, and Ephorus were the central sources for Diodorus' view of the Persian Empire before Alexander's campaign. His work is of utmost importance for our knowledge of the relationship and the conflicts between Greece and Persia in the fourth century BCE (Stronk 2017).

Dating back to Byzantine times only few excerpts of the large universal history by Nicolaus of Damascus, written in the time of Augustus, have come down to us. They present a fantastical history of Cyrus which was based on Ctesias. Of greater importance was another work of universal history, written in Latin by Pompeius Trogus, a native of Gallia Narbonensis. His 44 books are preserved only by an excerpt made by Iustinus (*Epitome*), which was probably written in the third century CE. The story of the Persian kings ranging from Cyrus to Darius I is mainly based on Herodotus, but additions based on later writers such as Ctesias were also made. The accounts of the reigns of Artaxerxes II and Artaxerxes III are of great importance. Books 11–12 treating the wars of Alexander the Great are strongly influenced by the *Vulgate*, although the author's own critical views also become obvious. Along with Herodotus' work, Justinus became the main source for the description of the Persian Empire and its history in the *Historiae Adversus Paganos* by Orosius

of Bracara, which is considered the most salient work of Christian universal history of late antiquity (Rollinger 2011).

Biographies, which began to become more popular, also played an essential role for the development of elementary ideas regarding the Persian Empire and its protagonists. The *Vitae* by Cornelius Nepos dating back to the later Roman Republic include a series of Greek army leaders who had to deal with representatives of the Persian Empire. The image of the Persian Empire is conventional, but Nepos also conveys some important information originating from sources of the fourth and fifth centuries BCE which have been lost in the original. His *Datames*, mainly based on Dinon's *Persica*, whom Nepos greatly admired (c.f. *Konon* 5.4), is of outstanding importance. Datames represents a noble satrap who fell victim to a false friend (Mithridates) and is destroyed by the hatred of the Great King (Artaxerxes II).

Even more than Nepos' *Vitae*, Plutarch's comprehensive biographies include important details on the relationship between Greek communities and the Persian Empire, which often date back to the fourth and fifth centuries BCE. His *Alexander* gained exceptional importance. It gives an idealized image of the protagonist and presents a series of interesting anecdotes. The Persian Empire itself is regarded more as a background setting for the story. The biography of *Artaxerxes II* requires special mention. The author mainly draws on information from the lost *Persica* by Ctesias and Dinon, giving a somewhat questionable image of the king living in a court full of luxury and intrigues (Binder 2008).

Plutarch's *Moralia*, a series of different essays, offer further, more scattered information about Persian customs and institutions, a number of anecdotes, and even details on Persian religious beliefs. The dominating point of view is determined by Greek ideas on moral behavior and cultural values. It also becomes obvious that Plutarch's attitude toward the conflicts between Greeks and Persians is far from neutral. In his treatise *De malignitate Herodoti* he addresses Herodotus' sympathy for the Barbarians in a negative way. A perfect example of the rhetorical idealization of Alexander is an early treatise where Plutarch addresses the idea of uniting the peoples of Asia and Europe by Alexander, who makes them live under the same order and rule (*De Alexandri magni fortuna aut virtute, libri ii* = *Moralia* 32d–34b).

The two most outstanding treaties on Alexander also appeared within the first two centuries CE. Curtius wrote a *Historia Alexandri Magni* in 10 volumes, of which 3–10 are still preserved, although with some lacunae. Based on the *Vulgate*, Curtius gives a fascinating account that includes a series of dramatic scenes and harsh moral judgments which point to the author's contemporary society. Alexander, a highly talented young king whose incredible success is too great a challenge for his moral competence, develops into a tyrannical ruler (Wulfram 2016). Meanwhile, Darius III is presented as a more

respectable character; however, the “oriental” setting of the story is described fascinatingly but in a cliché way. The Macedonian habit of taking on Persian customs and Persian luxury is evaluated in an extremely negative way by Curtius. He even mentions a melting together of the vices of both peoples (9.7.15) (Rollinger 2009; Briant 2010).

The image of Alexander put forth by Arrian is entirely different. The author from Nicomedia possibly already outlined his work under the influence of Trajan’s campaign against the Parthians and then completed it in the course of the decades that followed. He described Alexander’s campaigns in seven books, which he called *Anabasis* (as with Xenophon whose example he had taken). This work is followed by a small *Indike*. Although Arrian’s Alexander also shows some negative traits, he mostly behaves in a very competent way, especially with regard to his strategic abilities. Ptolemy’s work may have helped Arrian in describing the military ventures – both the big battles and the wearing feuds in the upper satrapies as well as the brutal campaign in India – as undertakings that worked according to a rigid order. The cultural world of the Achaemenid Empire remains relatively obscure to Arrian. But his *Anabasis* is one of the most important sources concerning the topography, the infrastructure, and the administration of the Persian Empire (Bosworth 1980, 1995; Ruffing 2017).

Strabo’s *Geography* is also an important source of information regarding these issues. In his work, which comprises 17 volumes, Strabo places the Imperium Romanum under the reign of the Emperor Augustus in the center of the *oikumene*. *Geography* is full of allusions to Alexander’s campaign as well as to the deeds of the former Persian kings from Cyrus to Xerxes. Strabo’s work gives detailed geographical accounts of the regions that had once been ruled by the Achaemenids and it includes a series of fragments of the early Alexander-historians. The encyclopedia (*Naturalis historia*) by Pliny the Elder (first century CE) abounds with details on the geography and nature of the Persian Empire. Claudius Ptolemy (second century CE) wrote a geographical handbook that preserves the whole contemporary cartographic knowledge of his time, including those regions where the Achaemenids once lived and ruled (Lenfant 2017).

On the whole, the importance of the literature written under Roman rule during the first centuries CE can hardly be overestimated regarding the understanding of what was said to be known about the Achaemenid Empire in Greek and Roman antiquity. As Lucius Ampelius states in his *liber memorialis*, a basic knowledge of the Achaemenid Empire was part of the elementary educational program (c. 13). The personality of the rulers and sometimes also that of generals as well as of noble women was a constant source of examples of exemplary and deterring behavior. Such examples are to be found in the writings by Valerius Maximus (first century CE) and in the anecdotes by Aelian (second/third century CE). According to Aelian, Artaxerxes III who conquered

Egypt once again was regarded as a sacrilegious despot like Cambyses (*varia historia* 4.8; 6.8; *natura animalium* 28). Athenaeus (second century CE) gives account of the way Persian luxury was imagined at the court of the Great King. So he describes that according to Heracleides Ponticus, the Persians and the Medes loved luxury more than anyone else but they were still the bravest and most generous among the Barbarians (*Deipnosophistai* 12.5, 512a). Pausanias' account of Greece in 10 volumes (second century CE) repeatedly refers to the time of the Achaemenids, the Persian Wars especially. A list of examples of stratagems in the various confrontations between Persians and Greeks is to be found in the work of Polyaeus (second century CE). Book 7 treats several kings, army leaders, and satraps of the Persians, whereas an entire chapter of Book 4 deals with Alexander the Great (4,3). Diogenes Laertius' *Lives and Doctrines of the Philosophers* (third century CE) convey important information on the ideas about the religious beliefs of the Persians as they have been conceptualized by earlier Greek authors. In this context, we learn of letters by Heraclitus of Ephesus and king Darius (9.13–14), for instance, and about Aristotle's ideas about the wisdom of the Magi (1.6–9) (Briant 1996; Brodersen 2010; Lenfant 2011).

During the Roman Empire, Persian kings and Persian topics also loomed large in the writings and declamations of the Second Sophistic. Since classical authors of these times conceptualized the contemporaneous Parthians as "Persians," the Persian War topic has generally been taken by modern scholarship as an element of official Roman propaganda, allegedly to stigmatize their eastern opponents as the eastern enemies of old days that had already been defeated by the west (Lerouge 2007). This is, however, a misunderstanding of these sources' intention and reach. It is true that the Persian Wars loomed large in educational contexts of the Second Sophistic, but they hardly became an instrument of official Roman politics (Rollinger 2019).

SECTION III.B

ARCHEOLOGICAL SOURCES

CHAPTER 15

Persia (including Khūzestān)

Rémy Boucharlat

Two of the four royal residences of Darius and his successors are located in southwestern Iran: Persepolis in the mountains of Fārs, the ancient Persia, the cradle of the Achaemenid dynasty; Susa in the lowlands of Khūzestān, an extension of Mesopotamia, a part of the ancient kingdom of Elam and the Achaemenid satrapy of Elam. Susa is halfway between Persepolis and Babylon in Mesopotamia, the ancient capital of the eastern world until Cyrus' conquest, and another Achaemenid residence. In this part of the empire, even carefully ruled as an "Itinerant state" (Briant 2002: p. 187) during the frequent and long journeys of the king, no city, not even Susa, is a permanent royal capital. This is probably the main reason why no cities in the true sense of the word, as we know them from previous Near Eastern empires, could be located at Persepolis or Susa, and why these two places were no more "urban" than Pasargadae, the residence of Cyrus, the founder of the empire.

Apart from these famous royal residences, the settlement pattern of the southwest of Iran is poorly known, not to speak of the religious monuments and cemeteries, though the situation has been changing slightly in recent decades. Newer discoveries fill some blanks on the archeological maps. This vast area covers three modern provinces: Fārs around Shiraz, Būshehr along the coast of the Persian Gulf, and Khūzestān to the west. Few sites occupied during the Achaemenid period are known outside the mentioned royal residences and a half-dozen elite buildings using stone components. To be added are find spots of column bases, sometimes in situ. The settlements of ordinary people, yet very few, are gradually identified in the three provinces as they are explored

and the archeological material becomes better known. Southwest Iran does not appear as densely populated at this time as some areas of the western parts of the empire, such as Egypt, Levant, and Anatolia, but these regions have certainly been more intensely covered by archeologists for some 150 years. As for the cemeteries, their absence is notable, apart from the royal tombs at Naqsh-e Rostam and near the terrace of Persepolis. This absence of archeological evidence raises the question of religious practices and beliefs of the Persians and other populations in the heartland of the empire (cf. Chapter 85 The Heartland Pantheon and Chapter 87 Funerary Customs).

Pasargadae, the First Royal Residence

Cyrus chose Pasargadae as his royal residence in Persia probably soon after his accession to power before 550. The main part of the site is organized and built in order to make visible the king's power. Located in an intermountain plain at 1850 m above sea level, Pasargadae benefits from permanent water resources in a rather mild climate in summer. The archeological site covers 300 ha. The known residential area (Figure 15.1) covers some 100 ha, in which a half-dozen stone buildings are scattered. The most famous monument, isolated in the southwest, is universally recognized as the tomb of Cyrus (Figure 87.1). This is a free-standing structure made of ashlar masonry, with large blocks carefully fitted and bound by iron clamps embedded in lead. It is house-like (6.40×5.35 m) with a gabled roof, resting on a plinth of six tiered steps (13.35×12.30 m on the ground). The inner burial chamber, which Alexander visited twice, intact in 330 and plundered in 327, measures 3.17×2.11 m and is 2.11 m high (Stronach 1978: pp. 24–43).

At 1300 m northeast there are two rectangular columned halls with respectively four and two pillared porticoes, and two small pavilions with columns (Figure 15.2). Beyond a bridge crossing the stream, a monumental gateway is also a pillared rectangular hall. In the opposite direction, a 14 m high tower (Figure 15.3) has been interpreted as a grave or a temple, which are unlike functions, given the very small size of the inner chamber placed in the upper part of the building without windows. According to a unique source (Plut. *Artax.* III, 1–2), to be cautiously dealt with (Binder 2010), this tower could have been the place of dynastic ceremonies, such as the coronation of the new king (Sancisi-Weerdenburg 1983). Northeast of these stone buildings, the 30 m high natural hill is crowned by a large platform, called Takht-e Solaiman, 14 m high, made of huge stone blocks carefully dressed and bound by clamps. It was probably planned to be the seat of Cyrus' residence. This project was given up and replaced under Darius I by a mudbrick defense wall and series of rooms (Stronach 1978: pp. 11–23).

The ashlar masonry is a new technique in southwest Iran. After his conquest of Asia Minor, Cyrus imported from Ionia and Lydia craftsmen, architects, and sculptors, who realized an architecture strongly influenced by art and techniques of these regions (stone cutting techniques, bases and column shafts, floors). These techniques are implemented in hypostyle halls which are, for the first time in Iran, equipped with stone column bases made of two square plinths supporting a torus, and in the two main buildings, with columns

made of stone shafts, which replace the wooden poles known before in the northwest and west (Nylander 1970; Stronach 1978; Boardman 2000). The plan of these buildings is a Persian creation, especially the hypostyle hall. Architecture and decoration also incorporate elements from Mesopotamia. Representations of animals and monsters on bas-reliefs and sculpture flanking the gates in Assyrian sculpture are also used at Pasargadae, perhaps at the main doorways of Gate R, but certainly on top of the columns of this building in the shape of double protomae which formed part of the capitals. The gate-house, a hall with two rows of four columns – also a Persian innovation – shows a remarkable bas-relief forming the jamb of a side entrance: a man (Cyrus or a genius?) wearing an Elamite dress with an Assyrian double pair of wings wearing an Egyptian crown (Figure 94.1). This relief intends to show the diversity of the empire, and this policy, born at Pasargadae, will find its grandiose representations in the sculpture of Persepolis and the architecture of that site, and in Susa as Darius made known in several inscriptions.

The whole flat area of the site from the tomb to the hill is crossed by an artificial stream derived from the river Pulvar. This surface of c. 100 ha is now interpreted as a park, a “paradise” (Greek *paradeisos*), a term of Old Persian origin (**paridaida*) and a Persian invention that the Greek authors admired in various places of the empire, but not in Pasargadae, which was unknown to them until Alexander’s conquest (Boucharlat 2011). According to their testimonies the Persian paradise is a place with vegetation, of very variable dimensions, and various functions, such as orchards or gardens, or for recreation or crop production (garden, orchard, hunting park, zoos) (Tuplin 1996: pp. 80–131). At Pasargadae, the British and later Iranian excavations have revealed in the central part of the park a place very precisely planned by stone water-courses forming a rectangle of 250 × 150 m (the south side is lacking); they are surrounded on three sides by another series of stone canals. A square basin (0.90 m a side and 0.50 m deep) is set at a regular distance of 14 m. The upper part has partly preserved the slot of a sluice aiming to regulate the water flow and allowing dipping for irrigation. Beyond this central garden, series of parallel or perpendicular anomalies detected by geomagnetic survey likely correspond to a network of fences and ditches organizing the space and made for distributing water in the park (Benech et al. 2012). As a matter of fact, the Greek authors (Str. XV 3.7; Arr. VI 29.4–9) actually mention a “paradise” around the tomb of Cyrus, but they do not specify its extension. They quoted the “eye witnesses,” Alexander’s companions, who may not have visited the whole site.

Beyond Tall-i Takht-i Solaiman hill, geomagnetic surveys have recently recognized a series of large, regularly oriented buildings partly covering the 20 ha of the depression which was protected by a mudbrick rempart. The function of these buildings, up to 40 m long, remains to be established: were they for housing workers, the administration, or the guard? And which date?

The surface reconnaissance and rescue excavations in the surroundings of Pasargadae between 1999 and 2009 revealed that Cyrus' project for his residence greatly exceeded the limits of the site with a development within a radius of over 20 km. Upstream, several dams were built across the Pulvar river and its tributaries. These dykes, measuring several hundred meters long, are made of earth reinforced with unhewn stones. Two of them located at 2000 m above sea level show a sophisticated control device consisting of a wide conduit over 1 m high, divided into six small channels that can be closed by sluices. This technology is perhaps borrowed from Assyria or Urartu, but developed with Lydian-Ionian stone techniques, very similar to the monuments of Pasargadae (2 m long blocks joined by the anathyrosis technique and carefully polished on the visible faces; use of iron clamps). These dams were not used to irrigate the restricted surface nearby but were primarily intended to regulate the flow of the river, especially during the flash floods which may happen in winter and spring. At the same time, they might have retained water for summertime.

The aforementioned other function was performed by the canals, which to the south of the tomb of Cyrus run on both sides of the Pulvar river, extending respectively over 10 km and 17 km. They are partly cut into the rock in the narrowing of the valley, partly built on an earth and stone levee. These canals were managed for irrigating the wider part of the valley downstream (9 × 3 km). On the left bank, the canal supplied water to a small residence, a multiroom pavilion with two opposite porticoes. In the valley, several farms, a village, and an area protected by an enclosure were excavated in 2005–2007 by an international project on behalf of the Persepolis Pasargadae Research Foundation (Boucharlat et al. 2009). These varied structures reflect the development of this region in the Achaemenid period and give an idea of the agricultural activities, echoing pieces of information provided by the inscribed clay tablets of Persepolis.

Persepolis, a Permanent Building Site

Located 40 km as the crow flies south of Pasargadae, Persepolis was built on the eastern side of a lower but larger plain than Pasargadae at 1600 m above sea level. The most impressive part of the site is the huge stone terrace supporting numerous columned buildings (Figures 15.4 and 70.2), visible from far away. At 6 km northward, four royal tombs are carved into a cliff. Both places were known by travelers sporadically between the fourteenth and sixteenth century, and visited by almost all travelers from the seventeenth century until the first archeologists at the turn of the twentieth century. The terrace was largely excavated before World War II by an expedition of the

Figure 15.4 Persepolis, aerial view of terrace from north-northeast. Source: Reproduced by permission of the Joint Iran–France Mission at Persepolis; photography B.N. Chagny.

University of Chicago, directed by Ernst Herzfeld between 1931 and 1934, then Erich F. Schmidt between 1935 and 1939. After the war, Iranian teams continued investigations at the foot of the terrace and on the top of Kuh-i Rahmat mountain, while architectural remains scattered in the plain were cleared out by salvage excavations, undertaken with the help of Italian restorers (1965–1979). Since 2002, the reactivation of the Persepolis Pasargadae Research Foundation has revived the restoration and protection of monuments and the exploration of the plain. Geomagnetic surveys by an Iranian–French expedition (2005–2008) provided fresh information on less visible remains, and from 2008 an Iranian–Italian mission commenced a series of soundings west of the terrace. Since 2011 this mission has undertaken excavation on a small mound which corresponds to a monumental gate. Built of mudbrick walls resting on baked bricks, the gate offers a plan (presumably measuring 39.07×29.06 m), very similar to the Ishtar Gate in Babylon; moreover, it is decorated with panels of glazed relief bricks similar in style and iconography to pre-Achaemenid Babylonian walls (bull, monster called *mush-khussu*). The gate should date between Cyrus’ conquest of Babylon (539 BCE) and Darius’ early reign, an early date confirmed by a piece of inscription prior to the Achaemenid Elamite language of the later period at Persepolis (Askari Chaverdi et al. 2017). Such a discovery supposes the presence of other royal constructions nearby, as it is in Pasargadae.

Persepolis, the royal residence and center of the satrapy of Persia, was to be a major population center that can be seen according to the semi-concentric circles: first the Royal Quarter, whose central point is the terrace; around this area the city within 4–6 km to Naqsh-e Rostam north via the west and to the south. Beyond this half-circle, the plain of Persepolis was developed to sustain the permanent population of the city and the thousands of people to be accommodated during the stays of the great king (family, court, guards, scribes, etc.). Benefiting from rather good natural resources, the plain was developed during the Achaemenid period, as evinced by hydraulic works more than by secondary towns or settlements, which have not been much located.

The Royal Quarter is not restricted to the famous terrace, 8–14 m high covering 12 ha and supporting some 20 buildings. It includes two other areas, one to the south, at the plain level, the so-called Southern Quarter with stone buildings, covering nearly 10 ha (Mousavi 2012: pp. 26–41), and one to the east, the steep slope of the Kuh-e Rahmat mountain overlooking the terrace and crowned by a line of mudbrick fortifications with towers (Figure 70.2). Protection on the west side of the terrace is less visible, a wall running from north to south, parallel to the retaining wall of the terrace. The “third enclosure” mentioned by Diod. Sic. XVII (71, 4–6) remains to be found (Mousavi 1992). Altogether the Royal Quarter covered almost 30 ha, it is only part of Parsa (Old Persian) “[the City] Persia” or “of Persians,” since Parsa is also the name given to the country of Persia itself.

Since Schmidt’s excavations (1953, 1957, 1970) the terrace and monuments have been described at length. It should be noted that the names of the various buildings are those given by archeologists and rarely those specified in the inscriptions, except *hadiš*, “seat,” or “residence,” which probably means residential building. *Tačara* is more uncertain, perhaps “house.” The most impressive building, not named in the inscriptions, is commonly called Apadana, by reference to a very similar structure in Susa which is so called in an inscription. Other names are descriptive, such as Hall of 100 Columns, east of the Apadana, with the main hall broader than this but without portico, or Hall of 32 Columns, Central Building. The term Harem is without any ground, while Treasury, storehouse, refers to the plans of rooms, and objects, often luxurious, found in many of them, including stone mortars, most of which are inscribed in Aramaic and sometimes mention “treasurers.”

The present-day remains represent Persepolis terrace as Alexander left it after he put fire to it in 330. Only a small part in the southwest quarter was repaired or maintained in the late fourth or third centuries. At Darius’ time most of the terrace was empty. He built the terrace itself, a task of several years, by cutting into the mountain, keeping the natural rock in places and reusing the extracted blocks to build the retaining wall in cyclopean masonry. The original access was on the south side, next to which Darius had engraved

four different inscriptions, two in Old Persian (DPd-e),¹ one in Elamite (DPf) which mentions the construction of the terrace and some buildings, and one in Babylonian (DPg) mentioning people who contributed to the construction.

Then Darius built the Apadana and his palace almost attached to it, which is the best preserved monument of Persepolis (Jacobs 1997). He erected the Treasury, the plan for which changed several times. These buildings take up the tradition of the pillared halls of Pasargadae but expanding them and changing them into a more complex layout. The central columned halls are usually square instead of the rectangular plan of Pasargadae. Unlike the Mesopotamian compact architecture of the palaces, the Persepolis buildings are separated from each other but not distant as they are in Pasargadae; each of most of them is built on a platform 1–2.60 m high. The Apadana is the most grandiose expression of the Achaemenid architecture: a square building of 110 m a side on a 2.60 m high podium. The columned hall, 53 m a side, counts six rows of six fluted columns resting on a square base and supporting a composite capital topped by two adorsed bull protomae. None of them is complete, raising the question of the direction of the protomae. The traditional reconstruction showing the lateral side of the bull in the porticoes (Krefter 1971: Beilage 3–4), as they are on the facade of the royal tombs, may be an artistic convention; a front position is quite plausible (Seidl 2003). The latter supported cedar beams from Lebanon. On three sides, the main hall is surrounded by columned porticoes with two rows of six columns resting on bell-shaped bases. The south side consists of a series of small rooms with a main corridor in the middle leading to Darius' palace. The porticoes are flanked by corner towers which contain several rooms at ground level and probably an upper story and a staircase to reach the roof. In the northeast and southwest corners of the audience hall, foundation deposits were discovered beneath the walls: two sheets of gold and silver bearing a trilingual text (DPh), together with gold, silver, and copper coins. The north and east porticoes are approached by stairways composed of four symmetrically arranged flights of steps. Their facades are covered with reliefs at eye level. Both stairways bear the same kind of figures. The central panel originally represented the king sitting on his throne giving audience to an official. Probably under Xerxes, both reliefs were removed to the Treasury and replaced by a series of guards. One side of the staircase is decorated with files of guards, followed by court members. The other side shows 23 tribute bearing delegations (cf. Chapter 94 Statuary and Relief).

The plan of Darius' palace is the archetype for the later buildings of his successors: a single portico flanked by guardrooms, a square hypostyle hall, with symmetrical series of rooms on the lateral sides and other rooms at the rear side. Xerxes and Artaxerxes would extend this layout for their own palaces.

The fortifications on the north and east sides of the terrace were built during Darius' reign and probably completed later. In two small rooms of the north fortifications, thousands of inscribed clay tablets, administrative documents, were discovered in 1933 (see Chapter 7 Elamite Sources). The remote location of these archives (Persepolis Fortification Tablets covering Darius' reign between 509 and 494 BCE) is still puzzling (Hallock 1969; Henkelman 2008).

The only visible architecture today at Persepolis is made of stone, but the buildings were made of clay, mudbricks, and baked bricks for the walls (5 m thick in the Apadana). Actually stone is limited to the column bases, door frames, actual and blind windows, staircases, and wall reliefs. Stone column shafts and capitals are restricted to the Apadana, the Hall of 100 Columns and All Nations Gate. The other columned buildings are equipped with wood poles coated with plaster and painted. Stone was extracted from quarries nearby, one being immediately north of the terrace, others located on a slope near Naqsh-e Rostam or at 5–10 km from the terrace. The most distant quarry, more than 30 km northwest of the terrace, provided a better quality used for sculpture.

Almost nothing was completed at the death of Darius in 486 BCE. That situation raises two questions. One concerns the location of official audiences and meetings during most of his reign; the other one is the type of buildings where the king and the court lived. Even in later periods, only some buildings on the terrace are really adapted to accommodate the king and his family and the court, namely a large part of the so-called Harem, which was not built until Xerxes, and, according to some hypotheses, the southern side of the Apadana where apartments could have been located on an upper story (Huff 2010 and other articles by Huff quoted there).

Xerxes completed his father's major buildings, erected the "All Countries" Gate to the north, and added his *hadiš*, today poorly preserved, in the south. He, or maybe his son, Artaxerxes I, began the Hall of 100 Columns and the smaller Hall of 32 Columns. Artaxerxes also built his own palace, to the southwest. The following kings were less active, but they may have enlarged or altered buildings, or removed pieces of them without signing their work with an inscription. Artaxerxes III (359–338 BCE) is the latest known builder for a staircase at the palace H and another one to the west of the palace of Darius (on function of the terrace, cf. Chapter 70 The Residences).

The terrace and the royal necropolis of Naqsh-e Rostam belong to the same project. As shown by the remains of stone architecture scattered west and north of the terrace, and the results of archeological surveys since 2000, the whole area between the two sites must be considered as Parsa that extended over some 20 km² (Tilia 1978: pp. 73–91). The spatial organization of this vast area consists of discrete concentrations of artifacts or structures, likely

corresponding to different social classes. An elite – or royal? – residential area about 3 km west of the terrace covers dozens of acres. It consists of low and small tepes separated from each other by several hundred meters. Blocks of hewn stone, and in one case a mural of glazed bricks, are still visible on many of them. These mounds probably correspond to large mudbrick buildings, surrounded by gardens. Such elite areas probably also existed north and northwest and perhaps in the south. Clearly separated from these areas are other large patches marked by pottery sherds on the surface, without visible traces of architecture. They should be the living quarters and workshops of more mundane people, and barracks of numerous workers employed for the construction of the royal buildings. One of these patches is particularly noticeable about 1 km west of the terrace. The location of the encampment of the guard is not localized but should rather consist of tents. The geomagnetic survey shows some anomalies corresponding to ditches and maybe some walls which are the flimsy remains of these settlements. Altogether, in the vast area between the terrace and the necropolis, the non-built spaces were the majority. However, they may correspond to managed landscape with orchards, large gardens, or parks.

The plain of Persepolis extends over some 100 km from north to south and 30 km at its greatest extension in the central part. In the southern half, the soil is today very salty, as it was in the past, according to analyses. It contrasts with the central part near the terrace and the northern one most intensively occupied from the Neolithic to the late second millennium BCE. After a gap of several centuries, the plain is again developed during the Achaemenid period and later.

Soil quality and irrigation possibilities make the plain a fertile region, which has negative consequences. Modern mechanized agricultural development provoked the disappearance of many witnesses of the ancient occupation. A multiperiod survey of this plain in 1968–1969 showed a rather low ratio of Achaemenid settlements, generally small in size (Sumner 1986). According to a survey conducted 40 years later, nearly half of these few settlements have been destroyed (Boucharlat et al. 2012). The best evidence of the Achaemenid and post-Achaemenid occupation consists of irrigation canals, the largest of which measured several kilometers, dams of earth and rough stone, and sometimes structures made of cut stone. Here and there isolated stone architectural elements have been reported, drums or column bases, but they have not been found in place. Some are unfinished, witnessing activity traces of transport between the quarries and Persepolis.

The image of Persepolis city offered by archeology does not contradict the description by Diod. Sic. (XVII.70, 3–5), which mentions the mansions that the army of Alexander plundered before reaching the terrace. However, the image of the occupation of the plain is quite poor in comparison with the

agriculture and craft activities evidenced by the Persepolis Fortification Tablets (see Chapter 62 Persia). The latter mention these places as estates and a few cities, which could explain the apparent lack of important archeological remains in the plain.

In southern Fars, occupation of the Achaemenid period was observed in a few places corresponding to elite buildings. Farmeshgān, 60 km south of Shiraz (Figure 70.1), a group of four stone platforms almost juxtaposed, measuring between 6.50 m and 10 m a side, is one example. Very little is known of this unexcavated site, but fragments of bas-reliefs were found on the surface, a spear-holder guard, rosettes, and a high relief of a lion. The use of the toothed chisel for working the stone indicates Darius I's time or later.

Near Fasa, 170 km southeast of Shiraz and near Darab, some stone bell-shaped bases of Persepolis type and ceramic material have been found which point to important Achaemenid occupations (Hansman 1975). The whole southern region to the Persian Gulf suffers from a hot and dry climate, creating an arid environment. Sparsely populated before the Achaemenid period, the region is more densely occupied from the early centuries CE on. The settlements are no longer concentrated along the perennial streams but extend higher on the slopes. In my opinion, this change is due to the introduction of a new irrigation technique, the underground water draining galleries. Very likely since the late Iron Age these shallow galleries were subterranean derivations from streams but did not tap the deeper water table. For the Achaemenid period we know only of galleries in Egypt tapping permanent water resources (Wuttmann 2001). This famous technique, called *qanāt* or *karīz*, permitted the occupation of more semi-arid and arid areas. However, despite Polybius X. 28, it is not yet clear whether the qanat technique was actually used in Iran and particularly in Fars as early as the Achaemenid period (Boucharlat 2001, 2017).

Human occupation is restricted to oases, such as the Borazjān at 70 km from Bushehr on the Persian Gulf shore. Royal stone buildings were found in different places today embedded within palm groves (Zehbari 2020). One of these palaces was excavated in 1970 southwest of the modern city. A hypostyle hall of 18 m in length at Sang-i Siah consists of two rows of six column bases, two-stepped square plinths, the lower made of a black and a white stone, the upper with white stone topped by a black torus. They are similar in color and size to those of Palace S of Pasargadae (a square of 1.10 m and 1.16 m, respectively). The hall is surrounded by four porticoes with two rows of bases; the eastern portico with 14 bases extends beyond the hall as at Palace P at Pasargadae. Another pillared building with one similar columned portico was excavated in 2005 at Bardak Siah, 12 km northwest of Borazjan, with bicolored stone bases. The rectangular hall exhibits four rows of six bases. In these palaces, there is no evidence of stone column shafts. In the latter an inscribed

fragment in Babylonian and a fragment of bas-relief showing the head and shoulder of a king under an umbrella with a servant were found. On one hand the column bases recall those of Pasargadae buildings, on the other hand the sculpture is reminiscent of Darius' reliefs at Persepolis. These constructions could have been begun by Cyrus and completed in Darius' time.

Western Fars and the Persepolis-Susa Road

This part of the province is still in the uplands (approx. 1000m above sea level) and has more favorable climate and water resources than southern Fars. This area was on the way between the two royal residences, Persepolis and Susa (600km), but archeology so far has failed to identify any of the 20 supply stations that were to be installed on the road for accommodating groups of travelers, the king and his retinue when he was visiting his "countries," messengers, troops, groups of nobles, and workers (Hallock 1969; Koch 1990). For example, the transfer of workers between the residences at Persepolis and Susa (Briant 2013) is attested only by Persepolis tablets. These buildings, probably made of mudbrick, did not leave many traces. However, this area is gradually revealing architectural remains of noble or royal residences in the form of stone column bases in different parts of the foothills. A region around the modern town of Nurabad seems particularly privileged. In the nineteenth and early twentieth centuries bell-shaped bases decorated with palm leaves, similar to those of Persepolis, were identified. After soundings by a Japanese expedition in 1959, it was not until 2006 that the site of Qaleh Kali was again investigated by an Iranian–Australian microregional and multiperiod project. Excavations (Potts et al. 2009) cleared more column bases which belong to a portico. Floors, stairs, and parapets are also made of worked stones. More importantly, this building was not isolated. In the same area, other buildings, palaces or pavilions, have recently been located, as evinced by some stone column bases. Dating to the Achaemenid period is assumed on the ground of the shape and the techniques of working stone and some artifacts, though they are often mixed with more recent objects. These strongly built constructions were not destroyed in the fall of the Persian Empire and were reoccupied in the next few centuries.

The Foothills and the Eastern Plain of Khūzestān

These areas were certainly important in the first millennium BCE, during Neo-Elamite kingdoms which correspond to the period of the penetration of Iranian populations. The meeting of these populations created an acculturation

which is called the “Persian ethno-genesis,” from which later emerged the Achaemenid dynasty (Briant 1984; Miroschedji 1985; Henkelman 2008; Álvarez-Mon and Garrison 2011). But the terms of this acculturation remain poorly known due to the lack of archeological evidence. For the first half of the sixth century BCE, only few graves of the elite were found incidentally, one in Arjān, near the town of Behbehān (Álvarez-Mon 2010), and another in 2007 near the town of Ram Hurmuz, to the west in the plain, whose luxurious furniture is still very little known (see Chapter 27). For the Achaemenid period, column bases show the existence of elite or royal residences. As an example, 5 of 18 column bases, belonging to a pillared hall of an Achaemenid palace or pavilion, were discovered near Ram Hurmuz in 2009.

Susa, the Choice of Darius Between Persepolis and Babylon

Susa is the most famous Persian residence known by the Greek authors (see Aeschylus, *The Persians* narrating the defeat of Salamis in 480 BCE; see e.g. Aesch., Pers. 16, 534-6, 730, 761). The palace of Darius differs from that of Persepolis in many respects, although the audience hall, called Apadana in a royal inscription, has obvious similarities with that of Persepolis. Susa is located in a vast plain crossed by several perennial rivers that allowed the early development of irrigation systems comparable to those of Mesopotamia. The plain and Susa itself suffered a significant population decline in the first half of the first millennium BCE after a flourishing period in the second millennium (Potts 2015: pp. 259–308). Permanent settlement in the plain during the Achaemenid period was relatively small, as it was in the Persepolis plain, and there was almost nothing around Susa itself between the Karkheh and Dez rivers. One hypothesis suggests that Darius, in deciding to install one of his residences in the old Elamite city, may have displaced the indigenous population that lived there and in the surrounding villages.

The limits Darius gave to Susa are defined by a massive mudbrick steep glacis, 18 m high, with no real defensive wall, enclosing 70 ha (Figure 15.5). Only one gate was found to the east, built of mudbrick. The inner space of the city is surprisingly empty apart from the royal quarter to the north. The whole empty space south of the palace was extensively explored by a long-term French expedition, with no results for the Achaemenid period, despite huge works in the late nineteenth and first half of the twentieth century under M. Dieulafoy, J. de Morgan, R. de Mecquenem and R. Ghirshman. Much more precise research conducted by J. Perrot from 1969 to 1979 unearthed only flimsy remains.

The palace is set on a 12 ha area (to be compared with the 12 ha of the Persepolis terrace) on the Apadana hill (Figure 15.6). Other buildings on the

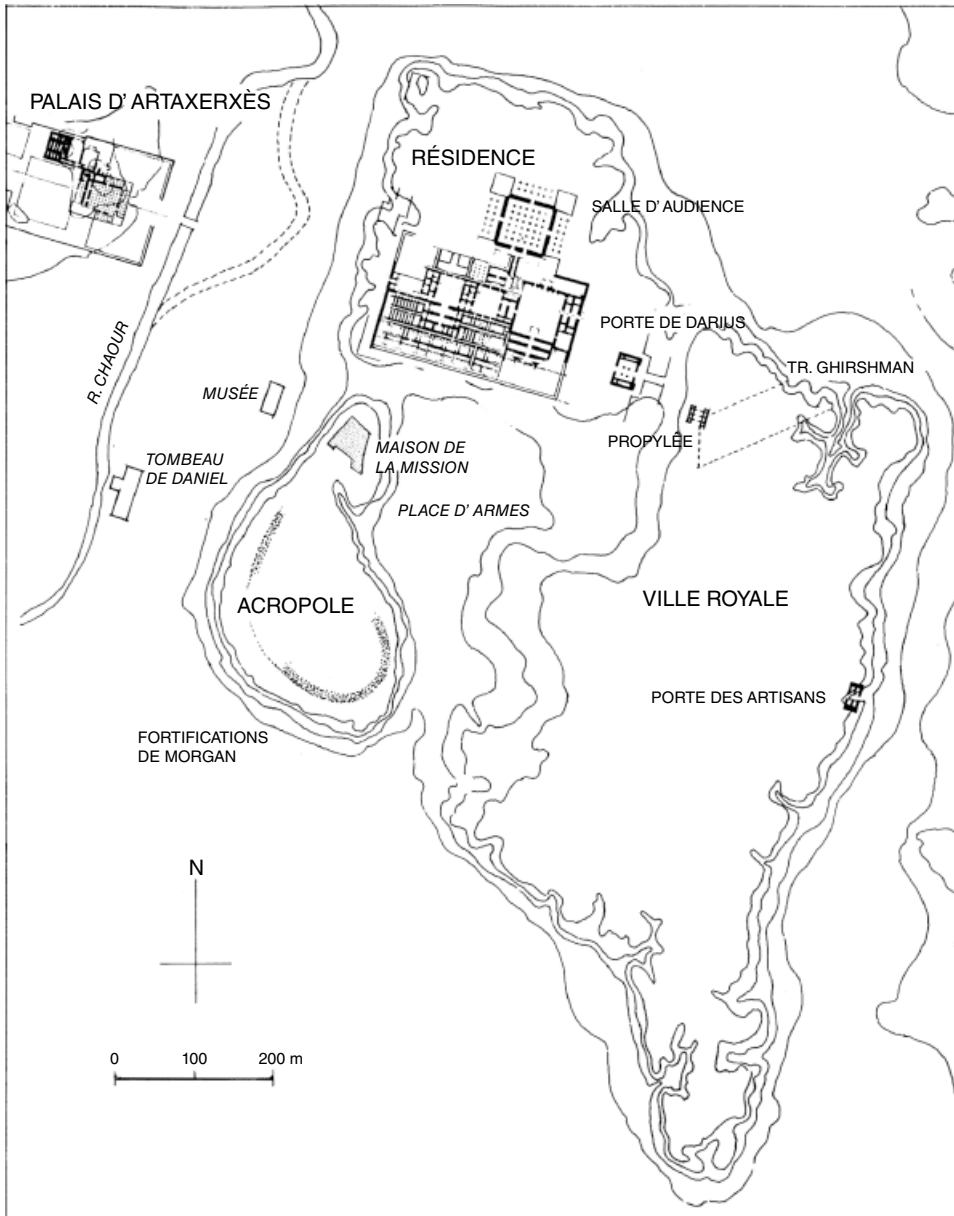

Figure 15.5 Site map of Susa. Source: Reproduced by permission of Remy Boucharlat and Danielle Perrot.

northwestern part of the “Royal City” hill (as the first French excavators coined it) also belong to the palace complex. To the southwest, the higher “Acropolis” hill was crowned by a poorly preserved Achaemenid period (?) mudbrick wall, 6–8 m thick, overlooking the palace.

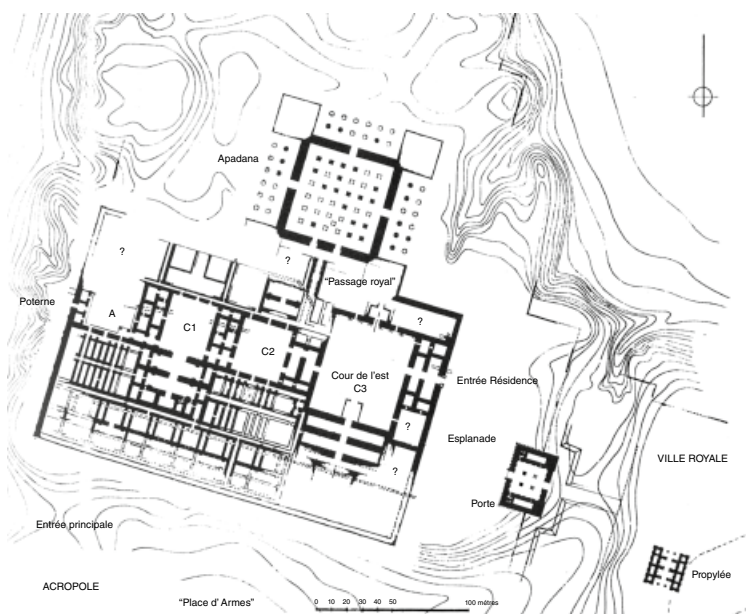

Figure 15.6 Susa, Palace of Darius. Source: Reproduced by permission of Remy Boucharlat and Danielle Perrot.

The palace is a compound of independent buildings (Ladiray 2013). Darius leveled the two hills to a constant 18 m above the plain (to be compared with the Persepolis retaining wall which was 12–14 m high). To extend the surface of the Apadana tell, the earth dug from the summit was moved to the slopes, creating a terrace. Walls and columns are set on a 10 m deep foundation made of gravel. The mudbrick walls rest on two courses of baked bricks. Stone is much less used than in Persepolis, for the mountains are 50 km away and most of the architecture belongs to the Mesopotamian tradition. Worked stone is restricted to bases, shafts, and capitals of columns. The stone bas-reliefs are not used in Darius' palace; the walls of the courtyards of the residence made extensive use of siliceous glazed brick panels, now in the Louvre Museum. Many of them depict a file of guards, others show lions, griffins, and antithetical sphinxes. The colors include brown, light green, yellow, white, sometimes cobalt blue, usually with gray-black outlines.

Inside the royal city the visitor first arrives at a building forming a monumental gate, called Propylaeum. It consists of two oblong contiguous rooms opening on two opposed porticoes with two square bases of columns. They bear an inscription in the name of Xerxes (XSa). The royal way then crosses the 14 m deep valley which separates the Ville Royale from the Apadana mound by a causeway bridge made of mudbrick boxes filled with earth. Here, the visitor is in front of the Gate of Darius.

The gate is a monumental building, 40 × 30 m, with a tetrastyle hall, like that of the All Countries Gate in Persepolis; it stands isolated from any other structure as in Persepolis. It is the symbolic passage between the outside and the inside of the palace. The gate is flanked by side rooms and stairwells leading to the roof. The square column bases bear an inscription in the name of Darius made by Xerxes (XSd). The passageway toward the palace was very likely flanked by two statues, of which only one was found in place. Apart from some fragments of at least two other statues previously found, this is the sole example of a human sculpture in the round so far known in the Achaemenid period. Originally, the statue was placed in Egypt, along the canal dug out by Darius (Yoyotte 2013: pp. 241–279). Later Xerxes brought it to Susa and placed the statue at the Gate that his father had left unfinished (Figure 94.8; cf. Chapter 94 Statuary and Relief).

The poorly preserved Apadana hall is very similar to the great hypostyle hall at Persepolis. A few column bases are not in place but their location is visible thanks to the stone foundation. The walls are marked only by the layout of the foundation trenches. Bull protomae of capitals also show the similarity with Persepolis. The column bases in the north part of the hall bore an inscription in situ of Artaxerxes II, who claims to have repaired this “Apadana” built by Darius and burned during the reign of his grandfather, Artaxerxes I. This is the only case in Achaemenid architecture where the term Apadana is directly associated with an existing building. The porticoes on three sides go out onto

open space, while the fourth side consists of a series of rooms and especially a perpendicular passage leading to the residence, as in Persepolis.

To the south, Darius' residence occupies 4 ha, built on a totally non-Persian plan but following Mesopotamian and Elamite traditions (Figure 15.6). The general scheme is organized around three main courtyards plus a small one (five courtyards in Nebuchadnezzar's palace in Babylon) that give light to the rooms and facilitate the circulation, as in the Mesopotamian palaces. The residence was entirely made of mudbrick on two courses of baked brick. The huge blocks in which are set the bronze doors' sockets are the only stone elements, often made of discarded column drums.

The reconstruction of the different parts and their function (Ladiray 2013: pp. 200–203; Perrot 2013: pp. 229–236) emphasizes increasingly controlled access from the eastern outer entrance toward the king's apartment opening on the western courtyard. The plan of the apartment with two parallel oblong rooms is a replica of the throne room in the Neo-Assyrian palace at Nineveh, and later in Babylon. In Susa, at the rear side the king's bedroom is added. At both sides of the entrance to that small room were buried the famous foundation tablets, square stone slabs of 33 cm a side, inscribed on all six sides, one in Elamite (DSz) and the other in Babylonian (DSaa). The two texts differ from each other. Darius symbolically describes the contribution of all peoples of the empire to provide rough materials, to carry them from their origin to Susa, and to build the palace. Copies of these texts, the originals of which were not visible, and the fragments of the Old Persian version were found in stone and bricks in several areas of Susa (Vallat 2013: pp. 281–293). The other royal inscriptions mainly belong to Darius and Xerxes.

The other kings who left several inscriptions are Darius II and above all Artaxerxes II in the first half of the fifth century. Not only did he rebuild, or repair, the Apadana hall but he erected a new palace on the other bank of the Shaur river that extends over 4 ha. The main part is a columned hall of six rows of six stone column bases, with painted wooden shafts. In that hall were found the only so far known wall paintings depicting half-size human figures. Amongst the pigments used, to be noted is the cinnabar for red. A few stone slabs showing small-size servants similar to those carved on the reliefs of different buildings at Persepolis were found in that palace as well as at the southern tip of the Ville Royale (Boucharlat 2013: pp. 371–395).

Cult Places and Burial Customs

On these archeological remains, we are very poorly informed. We have an idea of several deities worshipped in this region from the contents of dozens of Persepolis tablets. They mention food to sanctuaries of Elamite, Babylonian,

and Persian deities (Henkelman 2008). None of the corresponding places is known, but those places did exist, despite Herodotus I, 121 who had said that places of worship for the Persians were under the open sky.

Hypotheses have been put forward to recognize places of ritual ceremonies in some buildings of the Persepolis terrace, related to religion and/or to the dynastic cult, since the king is the intermediary between men and gods. This reinterpretation (Razmjou 2010: pp. 231–245) speculates that most buildings would be concerned, especially those called “palaces” by archeologists, given the representations of “offerings bearers,” who would be priests and servants bringing liquids and small animals for sacrifice. A single case of ritual seems convincing, near Darius’ *tačara*. The western flight of stairs has been adapted to manage a small room containing a pool of 30 m² and a small canal. Such an installation is suitable for ritual libations or liquid offerings.

Places for funeral ceremonies must have existed near royal tombs like that of Cyrus at Pasargadae. This is suggested, for example, by Arrian, who mentions one horse per month as a sacrifice to Cyrus (Arr. VI, 29.4–7). No installation is visible near the tomb in this unexcavated area, which has been severely disturbed. Four tablets from the Persepolis Fortification Archive mention sacrifices near installations called *šumar* (probably meaning grave), one for Cambyses, perhaps near Niriz, 100 km east of Persepolis (Henkelman 2003), another for a certain Hystaspes, who may be identified with some probability with the father of Darius. The latter building may be recognized in the platform halfway between Persepolis and Naqsh-e Rostam, but the only related building there is a columned hall. The sacred area of barely excavated Naqsh-e Rostam remains unknown; the only candidate there for a religious or funeral building is the Ka’ba-ye Zardosht. This stone tower erected in front of the cliff is an exact replica of the Zendan-e Solaiman tower at Pasargadae. The assumptions on the function of the two towers, which contain a very small room without windows in the upper part, have been brilliantly disputed – tomb or shrine? – without decisive argument. A third attractive but rather vague hypothesis is that the tower of Naqsh-e Rostam was erected by Darius for preserving the royal insignia (Sancisi-Weerdenburg 1983).

The only known graves of this period are the freestanding monument of Cyrus at Pasargadae, the rock-cut graves of Darius and his three successors carved into the 60 m high cliff at Naqsh-e Rostam, and the tombs of Artaxerxes II and III overlooking the Persepolis terrace. A cemetery excavated by E.F. Schmidt north of Persepolis contained dozens of individual burials in pits or in clay coffins, but they are usually dated to the late or rather the post-Achaemenid period. A unique grave was discovered in 2009 at the foot of the Persepolis terrace. A skeleton in a flexed position was put into a brick-walled pit and covered by two courses of mudbricks. The few items accompanying the dead have not yet been published.

An Achaemenid tomb was found at Susa, dating from the fifth or the middle of the fourth century. A brick vault protected a bronze sarcophagus. It had preserved the skeleton surrounded by rich grave goods, including gold and bronze jewelry, and semiprecious stones for torque, bracelet, necklaces, earrings, a silver bowl, and two alabstra (Frank 2013). As in Persepolis, it is hardly understandable that this royal residence, which was occupied throughout the Achaemenid period, has not left traces of other graves. Mazdaism, a religion which recommends the exposure of the bodies to prey birds, does not suffice to explain the absence of elite or mundane graves. There is no evidence that this religion or the Zoroastrian reform reached these areas, not even the royal family, whose members are apparently buried and probably mummified; moreover, it is certain that the other contemporaneous religions requested different burying customs.

Artifacts

The excavations or surveys of Achaemenid sites in southwest Iran were rather disappointing regarding the artifacts. The immense majority of the famous gold, silver, bronze vessels or jewelry kept in many museums in the world were not found in these royal or elite residences. Most of them come from the antiquities market or from chance discoveries (e.g. the Oxus Treasure). Very likely the Achaemenid residences were plundered during Alexander's conquest, and that is for sure at Persepolis.

Some stone vases were found in the Persepolis Treasury, together with pottery and metal objects, weapons, and tools (Schmidt 1957). At Pasargadae, an Achaemenid or post-Achaemenid treasure was found by chance near the bridge (Stronach 1978: pp. 168–177), while the excavations yielded pottery, bronze, and iron objects. From Susa, there are mainly the objects inside the so-called Princess grave, but a series of alabstra, often inscribed, has been found here and there on the site. A well has also provided a nice series of ivories carved in different regions of the empire, showing Persian, Syrian-Phoenician, Egyptian, and Greek styles (Amiet 2013: pp. 331–356).

The paucity of diagnostic objects is one of the main difficulties in identifying Achaemenid settlements. It should be noted that coinage is unknown in these regions until Alexander's conquest. Apart from the few coins from the Apadana foundation boxes, no coins have ever been found in the palaces, residences, and settlements which would have provided some chronological clues. Recent excavations, such as the Mamasani project near Nurabad (Potts et al. 2009) or the rescue excavations near Pasargadae, offer good opportunities to establish a chronology of the artifacts of the Achaemenid and later periods. In this respect, the archeology of the Achaemenid period, long devoted to the elite sites, remains in its infancy. The new excavations and survey projects will certainly greatly improve our knowledge in the near future.

NOTE

- 1 For the system of naming the Achaemenid inscriptions, see Chapter 6 The Inscriptions of the Achaemenids.

CHAPTER 16

Media

Bruno Jacobs and David Stronach[†]

In the absence of any written records from pre-Achaemenid Media, and in the absence – until not very long ago – of any archeological evidence from the Median homeland that could be associated with the Medes in the 200 years that preceded Cyrus II's capture of the Median capital, Hagmatana (modern Hamadan), in 550 BCE, the Median Logos of Herodotus (1. 95–106) long remained the only readily available, seemingly broadly acceptable history of the ancient Medes. Thus, even if Herodotus' description of ancient Hagmatana was never taken to be anything but fanciful (cf. Herzfeld 1941: p. 200), most scholars were content – at least until the early 1980s – to accept the Herodotean portrayal of the Medes as the rulers of an extended empire that was somewhat similar in character and extent to the subsequent Achaemenid Persian realm. This general acceptance of the Herodotean version of Median history was influential, not least, in terms of the different areas of expertise that the Medes were presumed to have possessed. Such areas were thought to have included the maintenance of written records, an ability to carve bas-reliefs, and the necessary skills to create the first rock-cut tombs in Iran (cf. Ghirshman 1964: p. 89).

The unraveling of such suppositions began when it was discovered that the rock-cut tombs in Media were either late Achaemenid or post-Achaemenid in date (von Gall 1966) and that Herodotus' account of the history of Media (including his allusions to a Median royal house that dated as far back as the eighth century BCE) bore little relationship to the nature of events in western Iran that is reflected in the annals of Assyria (Helm 1981). Not long thereafter

the very existence of a Median empire came to be called into question – and even the presence of a short-lived, united Median kingdom came to be doubted (Sancisi-Weerdenburg 1988). More recently, it has been proposed that the Medes put an end to their “political formations” and reverted to a “stage of tribal pastoralism” during the last 60 years of their independent existence from c. 610 to 550 BCE (Liverani 2003: p. 9). For many scholars this last verdict is far from necessarily correct; and, from an archeological perspective, the evidence that stems from recent excavations and surveys serves to affirm that, in overarching terms, continued permanent settlement in Media did not end in the late seventh century BCE (cf. Stronach and Roaf 2007: p. 49). In addition, monumental construction appears to have persisted at various sites (Stronach 2003: p. 237) and an early form of money was apparently in use in the heart of Media at a date near 600 BCE (Vargyas 2008). In short, it is more than likely that a united Median kingdom managed to control a major part of northern Iran during at least the first half of the sixth century BCE (Stronach 2012a).

Of the material remains of the province of the same name that emerged as a successor to ancient Media in Achaemenid times (Jacobs 2005: pp. 449–450) we know remarkably little. A variety of classical sources states that Ecbatana – the name that the Greeks gave to Hagmatana, the capital of the province of Media – was one of the principal residences of the Achaemenid Persian kings (Xen., Cyr. 8.6.22; Xen., Anab. 3.5.15; Str. 11.13.5; Ath. 12.513; Curt. 10.4.3). Unfortunately, however, extensive excavations in the original core area of Hagmatana have so far failed to reveal any coherent Achaemenid remains. As we now know, this puzzling situation seems to have arisen because at some point in the second century BCE all pre-hellenistic strata in this key locality were removed in their entirety in order to permit certain late Seleucid or early Parthian barrack-like structures to be founded directly on virgin soil (Sarraf 2003; Boucharlat 2005: pp. 253–254; Stronach 2012b: p. 55). In these circumstances the best archeological evidence for the importance of Hagmatana in early Achaemenid times may be said to come from adjoining trilingual inscriptions in the names of Darius (522–486 BCE) and Xerxes (486–465 BCE) that were cut into an eastern rock spur of Mount Alvand (DEa and XEa), located a few kilometers to the southwest of the city (Lecoq 1997: pp. 126–127; Curtis 2000, illustration 43; *here* Figure 16.1). Whether or not this evident royal interest in the cool, forested foothills that flank the western side of the city could be thought to account for a notice in Pliny (HN 6.116), to the effect that “Ecbatana” was “transferred” to the mountains by Darius I, is difficult to say. An alternative possibility is that the inscriptions in question were merely placed on one of the more readily available, inviting rock surfaces that stood in the near vicinity of this vaunted Achaemenid capital.

Figure 16.1 Ganj Nameh, Inscriptions of Darius I (DEa) and Xerxes I (XEa).
Source: Reproduced by permission of Gian Pietro Basello – DARIOSH Project.

The best available indication of Achaemenid construction in Hagmatana comes from the local presence of a number of inscribed stone column bases (A²Ha, b, d), even if their exact, original context remains unknown (Knapton et al. 2001). One inscribed base in particular carries an Old Persian inscription (A²Hb) of Artaxerxes II (404–359 BCE) in which the king relates that he built an apadana – a palace – “of stone in its columns” (Kent 1953: p. 155). While this inscription forms part of the inscribed evidence of Achaemenid date that is often invoked in order to suggest that an apadana was erected at Hagmatana/Ecbatana (as was the case at Susa), it is also relevant to note that Polybius offers a detailed description of a local Persian palace that was still in existence in the days of Alexander (Polyb. 10.27; cf. Ctes., FGrH 688 F9). According to Polybius’ account, the woodwork of this structure was all of cedar and cypress, but no wooden surface was originally left exposed because every part was plated with either silver or gold. Polybius goes on to observe that “most of the precious metals were stripped off in the invasion of Alexander... and the rest during the reigns of Antigonos and Seleucus.” At the same time it would be arbitrary to conclude that certain inscribed stone elements, even when they bear inscriptions in the name of Artaxerxes II, should necessarily be associated with a palace or sanctuary in which this same monarch is said to have erected a statue of Anāhitā (Beros., FGrH. 680 F11; cf. Plut., Artax. 27.3; Isid. Char., FGrH 781 F2,6).

While there is a nearly complete dearth of scientifically excavated Achaemenid materials from Hamadan, the art market has not hesitated to invoke this same provenience for a wide range of objects, including both forgeries and other items that have come to light through clandestine operations (Muscarella 1980: pp. 31–35; cf. Chapter 105 *The Achaemenid Empire and Forgery: Material Culture*). Prominent among other objects with a dubious status are the well-known gold tablets with late Achaemenid inscriptions written in the names of Ariaramnes and Arsames (AmH and AsH: Schmitt 1999: pp. 105–111) as well as duplicates of the foundation texts that were found in the Apadana at Persepolis (DH*a*: Lecoq 1997: pp. 218–219; cf. the discussion of these items in Mousavi 2012: pp. 43–44 with n.121; see also Chapter 104 *Achaemenid Empire and Forgery: Inscriptions*).

The knowledge that we currently possess of the mud-brick architecture of Media in the seventh and early sixth centuries BCE (cf. Stronach and Roaf 2007: pp. 181–182) may begin to allow us to speculate on various aspects of the character of the smaller settlements that must have typified the province of Media in Achaemenid times. To start with, Media's absorption into the far-flung Achaemenid Empire must have produced an altogether new sense of security. As a result, people who had previously chosen to reside, if at all possible, on clearly defensible, rock outcrops or on the often considerable heights of long-established prehistoric mounds, would have not taken long to abandon such locations in favor of new habitations that stood at the same level as their orchards and fields. In these new conditions the main arbiter of location would have been the availability of water. And in many cases the recently available technology of the qanat (cf. Wilkinson 2012: pp. 16–27) was no doubt used to bring cool, clean water from distant, underground aquifers to the exact point where surface water was required.

While Achaemenid builders frequently included worked stone elements in major structures, we can be sure that everyday construction in the countryside would have largely depended on mud-bricks, mud-brick struts and wood. In addition, it is important to note that, while the standard mud-brick in independent Media was oblong in shape and measured c. 40×24×12 cm in size, the Achaemenids introduced a smaller, square mud-brick that was normally 34×34×12 cm in size. Indeed, it is changes in brick sizes – not to mention subtle changes in pottery – that will no doubt ultimately allow archeologists to plot the still missing patterns of rural settlement that must have characterized the broad plains of Media in Achaemenid times (cf. Boucharlat 2005; Curtis 2005).

As to the likely appearance of the settlements in question, most villages were presumably characterized by a preponderance of flat-roofed, single-storied houses. Also, on the evidence of not-too-far-distant rock-cut tombs of the late fourth/early third centuries BCE, certain of the houses may well have been

marked by porticoes with elegant wooden ceilings and two or more wooden columns (cf. especially Herzfeld 1941: fig. 312).

Since archeobotanical studies of the excavated Median and Parthian plant remains from Tepe Nush-i Jan indicate that emmer, bread wheat and barley were grown in both these periods (Kylo and Hubbard 1981), it is only logical to suppose that these same cereals were among those that were cultivated locally in the interval between these periods. Parallel studies of the animal bone sample from the Median and Parthian settlements at Tepe Nush-i Jan are also informative. In both Median and Parthian times cattle remained the main source of meat. The real revelation, however, is the very varied character of the local horse population in these two periods. In this context the bone sample indicates that the famed pastures of Media were home to (i) large, heavy horses (with a withers height of over 150 cm), to (ii) horses of a median size (with a withers height of 135–137 cm), as well as to (iii) a miniature form of horse (such as very possibly represents an independent breed) with an average withers height of only 105–110 cm (Bökönye 1978: p. 28).

With reference to the extent to which Achaemenid art and architecture can be said to be indebted to prior Median achievements, it has recently been suggested that the innovative columned halls of eighth/seventh century Media may not have had quite such a strong influence on the evolution of the famed columned halls of Pasargadae and Persepolis as was once imagined (Gopnik 2010: p. 196). On the other hand it is clear that a number of motifs that are found in the monumental mud-brick architecture of Media eventually re-emerged as elegant designs, rendered both in stone and in other materials, in various late sixth-century and later Achaemenid contexts (Roaf 2010). Since certain of these motifs are first found on the walls of the central temple at Tepe Nush-i Jan, and since they would seem to re-appear on occasion in equally numinous settings, it is all the more interesting to note that the stepped portion of the mud-brick fire altar from the central temple (Stronach and Roaf 2007: fig. 2.13) almost certainly finds an echo in the stepped upper and lower extremities of the characteristic Achaemenid stone altar – actual examples of which were encountered at Pasargadae (Stronach 1978: fig. 72).

Aside from being masters of construction in mud-brick, as well as redoubtable riders – and breeders – of horses, the Medes appear to have been celebrated, in the Achaemenid period especially, for their skills in metalworking. This is evident, not least, from a glance at the choice gifts of precious metal that are displayed by the Median delegation in the parade of subject peoples that adorns the carved socle of the Apadana at Persepolis (Schmidt 1953: pl. 27). On the other hand, the fact that Darius I chose to depict his Persian subjects in the bas-reliefs at Persepolis in two separate forms of dress (perhaps best defined as a voluminous “court dress” and a more tight-fitting “riding dress”) can no longer be used to support a never very convincing suggestion

that those individuals in riding dress were all Medes and that, accordingly, the Medes shared the governance of the Achaemenid empire with the Persians (see, e.g. Stronach 2011: p. 477).

CHAPTER 17

Babylonia and Assyria

Walter Kuntner and Sandra Heinsch

The archeological evidence for Achaemenid rule over Herodotus' ninth satrapy can be described as decidedly wanting, compared to relevant historical sources. Few are, in fact, the architectural remains possessed of Achaemenid imperial character¹ that can be found within this territory. In this paper, it consists of the historical regions of Babylonia and Assyria conveniently demarcated by the frontiers of modern Iraq and tentatively partitioned according to Xenophon's Median Wall (Gasche 1995).

The most prominent finding is without doubt the Perserbau abutting the Südburg in Babylon (cf. Figure 70.4). This annex has been dated differently by various scholars: either to the reign of Artaxerxes II on the grounds of epigraphic evidence, or to the reign of Darius I on the basis of the red-colored finish of the rubble-and-gravel floor. The closely related issue of the Anbauhof complex of the Südburg (Figure 17.1), as possible additional evidence of an Achaemenid imprint, has received less attention, despite the more far-reaching consequences it might have for our understanding of Achaemenid Babylonia (Gasche 2010). Gasche's approach discusses firstly the characteristic layout of this complex's reception suite (RS), whose congruence with the RS of Darius I's palace at Susa (Figure 15.6) led him to suggest the re-dating of the Anbauhof to that king's reign. Secondly, he calls attention to the RSs' openings, onto the courts of the Anbauhof and Westhof respectively, occurring with only minor variation in all three palaces in Babylon, yet which are missing at Susa. This fact additionally prompted Gasche to take into consideration the re-dating of the Westhof complex to the reign of Cyrus the Great, and thus to

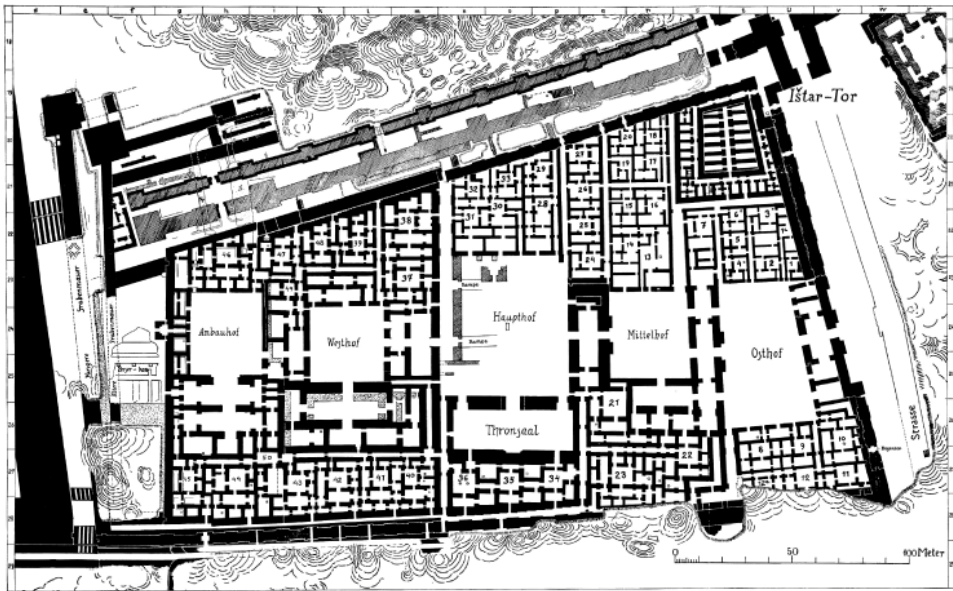

Figure 17.1 The so-called *Südburg* of Babylon.

propose a new chronological framework for the architectural history of the palaces of Babylon (cf. Amiet 2010).

The problematic aspect in Gasche's (2010: p. 458) reasoning is the assumption that the occupation layer of the rebuilt Anbauhof complex was once raised together with that of the Westhof complex, in order to merge with the uppermost pavings of the court of Nebuchadnezzar II's Haupthof (henceforth shortened as Nebuchadnezzar). In fact, based on this assumption, he considers the brick rubble containing the Neriglissar cylinders to be the constructional underpinnings of the new western palace wings, installed after that reign.

There is, however, no archeological proof for this assumption. The idea that the whole palace area was raised by Nebuchadnezzar to the same level goes back to Koldewey's (1931: pp. 75–77) attempt to explain the purpose and, above all, the condition of the mudbrick wall delimiting the Haupthof to the west. According to him, the fact that this wall was built from mudbricks could only mean that it represented a temporary stage of construction. However, connecting the Westhof and Haupthof via the vaulted corridors would have been too big an effort for a mere passing phase of construction. This temporality can be excluded all the more safely because of the remains of mudbrick walls, found in the northwest corner of the Haupthof, considered by Koldewey a sanctuary of the Achaemenid period. In fact, the latter lay immediately above the paving of Nebuchadnezzar, slightly overlapping the northern ramp. From this, it may be concluded that the ramp system continued to be used at least until Achaemenid times.

The picture thus emerging is rather one that shows the brick pavings of the four western courts lying at different levels up until the Achaemenid period. These heights coincide with the downward sloping gradient of Nebuchadnezzar's uppermost paving, made of stamped, 50 cm square terracotta tiles running between the Südburg – from which it was accessible through several gateways – and the inner city wall.² In this respect, the brick rubble containing the Neriglissar cylinders can hardly be considered the underpinnings of the Anbauhof, which was, according to Gasche, rebuilt at a higher level in post-Neriglissar times. Therefore, it seems rather that the brick rubble was not put in place till the construction of the Perserbau, when it served as the underpinnings for the continuation of its red-colored floor, in order for it to link up with the brick pavings in the eastern Südburg complexes. There, the double protome column capital of Achaemenid type signals, at least, the maintained use of this occupation layer until that time.³ It is only due to this episode of construction, that the split-level building design of Nebuchadnezzar's Südburg was abandoned, obliterating the Anbauhof and Westhof complexes.

This hypothesis explains, with equal success, the distribution of the Neriglissar cylinders across several rooms of these complexes and, more effectively than Gasche's proposal, their location within a selection of layers across the compound's multiple strata of brick rubble (cf. Koldewey 1931 : p. 106).

Nevertheless, the basic idea proposed by Gasche remains attractive, in particular relating to the foundation walls of the gateway leading to the Persischen Kiosk, insofar as he suggested that they were built of brick rubble (Koldewey 1931: Pl. 20 and 32). This building technique is well attested in the Achaemenid period. It is then, in this sense, certainly conceivable that the building material was obtained by dismantling the Chaldean palace walls, as suggested by Gasche, thus relocating Neriglissar's cylinders. However, this does not necessarily coincide in time with the construction of the Perserbau.

But, all in all, the evidence from the Anbauhof is intricately complex because of its fragmentary nature, and is self-contradictory on a case-by-case basis. Architectural details are sometimes selectively described, and not always entirely conferrable to the situation shown in the plans and vice versa, or because details visible in the plans, such as the previously mentioned brick rubble foundations, are not always described in the report. As a result, the true extent of this typologically characteristic feature within the Anbauhof complex is unclear, particularly as regards to the RS. The question, whether this layout represents, in Babylon, an Achaemenid conception, or an Achaemenid-period emulation of a long-standing residential concept, cannot be conclusively deduced.

Irrespective of the quest for Achaemenid imperial architecture, the written sources and artifacts found on the Kasr clearly attest to the maintenance of the

Neo-Babylonian palaces, and, in particular, to that of the Hauptburg by the Achaemenid kings and their satraps. The Kasr archive of Belshunu vividly illustrates the central role which the building's infrastructure had on the Kasr, and which it must have played in the economy and administration of "Babylon and Across-the-River"; this is well reflected, for instance, in the so-called Babylon silver hoard (Reade 1986). The fragments of the Babylon version of the Behistun relief-inscription of Darius I can likewise be placed in this historical context (Seidl 1999).

Such an idea of continuity, based on written attestations as well as on inferences from the archeological findings, basically applies to any structure used in Neo-Babylonian times (see now Baker 2012). Their putative disruption in Achaemenid times was, for the most part, simply postulated on the basis of the uncritical quotation of classical accounts, or, as in the specific case of Babylon, considered in passing only while concentrating on other questions.

The city walls of Babylon are a telling example of this attitude. Since the beginning of field research, this structure has been perceived as one of the most outstanding and fascinating monuments of "Nebuchadnezzar's Babylon," whose image was so vividly implanted on European mind both by Biblical metaphors, and by Herodotus' detailed description. The persistence of its character as a fortification into Parthian times was, no doubt, already recognized by the German excavators, but extraneous to the pursued exposure of that preconceived image of Babylon. Indeed, the extensive maintenance efforts under later kings are thoroughly discernible in the archeological documentation. The problem, in retrospect, is that it is hardly possible, on the basis of the existing documentation, to date them more precisely within their Late Babylonian horizon.⁴

The main reason for scholarly concern about the defensive integrity of the city walls in Achaemenid times is, however, the abrupt interruption of the mudbrick walls northeast of the Ninmah temple. Because this feature is located next to a cut-off meander of the Euphrates, scholars have assumed that the disruption was caused by the shift of the Euphrates' riverbed east of the Kasr. The date of this event in the early Achaemenid period was chiefly substantiated through reference to Herodotus' and Ctesias' descriptions of Babylon (Wetzel 1930: p. 77). Though Wetzel (1930: p. 21) certainly described the presence of mud and alluvial sediments at the bottommost levels, he failed to prove that they actually overlaid the city walls. There is nothing to disprove that this meander developed far earlier (contra Bergamini 2011: pp. 26–28, Pl. 5).⁵

The critical reappraisal of the German excavations' evidence corroborates this interpretation, for it proves that the interruption of the wall was already extant before the time of Nabonidus (Heinsch and Kuntner 2011: pp. 512–520). This segment of the city wall might, therefore, never have been

Figure 17.2 Reconstructed view of the building complexes in the quarter of Ay-ibūr-šabû (Koldewey 1913: Fig. 43).

completed, or even planned by Nebuchadnezzar to connect to the eastern line of fortification. One reason for the abandonment of this segment's construction might have been the building of the Osthaken, which continues the eastern line of the inner city walls up to the Sommerpalast in Babylon, making its completion superfluous (cf. Lippolis et al. 2011: p. 6). But it is also conceivable that this segment was restricted *ab initio*, in order solely to reinforce the quarter of Ay-ibūr-šabû when it was elevated by Nebuchadnezzar (cf. Pedersén 2011: pp. 14–18); a possibility already considered by Koldewey (Figure 17.2).

The ancient classical accounts on the relationship of the Achaemenid kings to the Babylonian temples had an even more profound impact on the historicization of these archeological records than the above. The reassessment presented by Kuntner and Heinsch basically criticizes the previous, biased interpretation, firstly, of the consistency of Neo-Babylonian religious architecture as an indication of its ephemerality and, secondly, of the absence of building inscriptions after Cyrus the Great as a willful refusal by the Achaemenid kings to act as temple provider. The absence of building inscriptions has also been interpreted as proof for the dissolution of the Babylonian temple institution within the early Achaemenid period.

The temples at Babylon and Borsippa give evidence of a continuous and strict compliance to Neo-Babylonian architectural and cult traditions into the Seleucid period. During the Achaemenid period, no significant breaks, let alone violent episodes of destruction, are visible, even though these cities represented the main strongholds in the revolts against Xerxes in 484 BCE. Wherever breaks were identified in the brickwork, they signaled the complete rebuilding of the temple maintaining the existing layout with considerable accuracy.

It can, therefore, be deduced that the lack of royal building inscriptions might indicate a shift in the manifestation of Babylonian kingship ideology

during the Achaemenid period. This privilege of providing for the temples might have been conferred to high-ranking personnel of the temple administration, as happened, for instance, in the cases of Anu-uballit Nikarchos and Anu-uballit Kaphalon in Seleucid times. Needless to say, such a situation clearly hampers any attempt to identify the individuals who sponsored the rebuilding of the temples, and their maintenance. However, the archeological situation has only recently become subject to a more permissive, yet nevertheless cautious, interpretation of the archeological records, in reassessing the stratigraphy of construction in regard to the Achaemenid period (Kuntner and Heinsch 2013). Even now, however, this reassessment suggests anything but a standstill in Babylonian religious architecture. On the contrary, there are indications suggesting the *Hürdenhausanlagen* (Heinrichs 1982: pp. 283–335) to be an innovation of the Achaemenid period, or to have at least become the standard layout concept from that time onward, complying with, if not quintessentially fulfilling, the ideals determined by the “archetypal cult-center” of Esagila at Babylon (cf. George 1999).

In this specific context, the ziggurat Etemenanki of Babylon requires special mention. The poor state of preservation of Etemenanki, and its alleged close connection to the rubble mounds at Homera, have, from the very beginning, animated scholars to take “Koldewey’s paradox” as the striking proof for the accuracy of classical narratives; namely, the destruction of the ziggurat by Xerxes and the successive leveling of the ruin by Alexander the Great for his planned but never accomplished rebuilding. Those archeological arguments put forward to advocate this view were based on the preconception that the remains excavated in the plain called Sahn are vestiges of a once entire and intact ziggurat (George 2010).

The archeological situation contradicts, however, the historical view in several instances. Firstly, the evidence of the leveled mudbrick core speaks against the distinction of three superimposed ziggurats dated, respectively, to Esarhaddon, Nabopolassar, and Nebuchadnezzar. These remains give proof of just one mudbrick core. Secondly, the foundation level of the first stage encasing the mudbrick core lies some seven meters lower than Nebuchadnezzar’s precinct wall (Bergamini 2011: p. 23, fn. 6). This point does not, by itself, provide the basis for a valid argument against a date in the first half of the first millennium; but it does raise the possibility of much earlier dates, for which there exist written attestations of building activities. Thirdly, the argument that the ziggurat might have sunk is contradicted by the evidence from Borsippa, where the layers abutting the bottommost brick layers of the mantle were still lying horizontally, or were even curved upwards slightly. On the other hand, visible subsidence, of up to 2 m, affected the mudbrick core of the ziggurat at Borsippa (Allinger-Csollich 1991: p. 439, Fig. 26, p. 457, Fig. 34, p. 478). The absence of comparable subsidence affecting the mudbrick core

at Babylon suggests that the remains uncovered in Sahn never towered much higher than they do today, or at least than they did before they were leveled in Sasanian/Islamic times. As a result, the remains of Etemenanki can best be identified with Nabopolassar's ziggurat. As stated by his son, this construction could only be continued to a height of 30 cubits, but remained, ultimately, unfinished (Kuntner and Heinsch 2013).

Finally, continuity is also reflected by the domestic architecture (Baker 2010). Research continues which is attempting to link changes in the design of dwellings to specific historical events. Predictably, such approaches remain controversial (Heinsch et al. 2011).

Of far greater interest to the issue of simultaneity, and to considerations of the durability of layouts in Babylonian architecture as a mirror of "social dimensions," are the results of the excavations at Tell Abu Qubur and Tell Mahmudiyah (Gasche 1995: pp. 207–209). The house partly unearthed at Mahmudiyah maintained a principally traditional Babylonian layout, despite being newly founded between the late fifth and late fourth centuries BCE. This evidence of continuity stands in clear contrast to the examples from Babylon, Nippur, and Ur, where the Achaemenid period architecture evolved from a Neo-Babylonian precursor. The Abu Qubur building, on the other hand, is characterized by two "salles à quatre pilasters," situated north and south of the central court, and dating to the same time period as Mahmudiyah. Noteworthy in this context is Gasche's suggestion that the antithetic arrangement of the halls at Abu Qubur might represent a stage of development in said evolution. Basically, this suggestion picks up the introductory remarks on the date and originality of the RS in Babylon. Although the question of originality cannot be conclusively settled, it nevertheless seems to echo the situation observed in the field of religious architecture, where long-standing building concepts were adapted in Achaemenid times, and developed their own distinctive architectural features.

Viewed in this light, the archeological evidence for Achaemenid rule over Babylonia is not meager, but hardly unentwineable from the Late Babylonian horizon, since neither the beginning nor the end of the Achaemenid period can be delineated by a stratigraphic horizon. On the other hand, this situation raises the question of whether such a distinction would be at all useful for a better understanding of the development of material culture. The latter has, in fact, so far been described as a gradual change over time, from a more Babylonian to a more Hellenistic fashion, and as marked rather by the accentuation of characteristics than by sudden breaks. Such a situation, it is clear, should not be regarded solely as the outcome of an inadequately understood Late Babylonian stratification.

In contrast to the situation in Babylonia, this problem was originally addressed in the archeology of the Neo-Assyrian Empire, with the result that

an Iron Age terminology was adopted parallel to the historical terminology, to emphasize the autonomy of pottery production from political breaks, including from the aftermath of the fall of Assyria in 614/612 BCE. Nevertheless, Iron Age terminologies still continue to be classified along political lines (Hausleiter forthcoming). This becomes particularly clear in the distinction between a “Neo-Babylonian” and an “Achaemenid” post-Assyrian period (cf. Curtis 2005).

However, since Curtis’ seminal works, new results have been published, calling for an inquisitive reassessment of the view held therein, which pronounces the destruction of the Assyrian capital cities to have been both profound, and the following re-occupation of an “impoverished nature” (cf. Kreppner *forthc.*).

As regards the first aspect, it is remarkable that the renewed Italian investigations at Fort Shalmaneser determined a much less violent destruction, than was described by the English expedition, of the building and its adjacent fortification to have taken place. On the contrary, both clearly show constant efforts of restoration and maintenance, so that the excavators even wonder whether these facilities did not remain functional within the Neo-Babylonian administration of Assyria (Fiorina et al. 2005: p. 95).

The palaces doubtless never reached their former splendor again; however, this should not be seen as an indubitable sign of an impoverished populace as well. It is equally conceivable that the imperial, and mostly military, administrative facilities had become redundant in light of the new political situation of Achaemenid times, so that their repair and maintenance was no longer necessary. On this question, however, a better knowledge of the sequences of settlement of the capital city’s areas, as well as of the chronological order of the post-canonical eponyms, would be desirable. This is because, firstly, the correlation of some horizons of destruction with the Median-Chaldean assaults in 614 and 612 BCE proved, most recently, to be, at the very least, questionable (Miglus forthcoming; Taylor et al. 2010), and, secondly, because the assignment of most of the post-Assyrian traces to the Neo-Babylonian period is chiefly based on the preconception that the “uniformity of pottery” could not have spanned a period of time longer than a generation. It has become clear that such a notion of restricted continuity can and should no longer be advocated (van Ess et al. 2012).

In this context, the evidence of phase H of the Achaemenid occupation of the Burnt Palace and Ezida Temple complex in Nimrud is most conspicuous (Curtis 2005: pp. 180–181), but, at the same time, also controversial. Provided that the current stratigraphic correlation is correct, it would, in fact, entail the re-dating of the mudbrick temple façade “decorated with the ‘niche and reed’ type” from the Neo-Assyrian to the Achaemenid period (Oates and Reid 1956: p. 37, Pl. V, 2 and Pl. VIII): it is true that in the section of the street between the Burnt Palace and the Nabu Temple, the foundation trench of the

dressed limestone substructure is drawn as having been deepened from the surface of level 7. However, in this stratigraphic context, the building process has interpretative priority over the interface determination, which means that the pith-filling (level 6) of the foundation trench should be correlated correctly with the overlaying level 5, and with the corresponding drain. In spite of this, both are attributed by the excavators to phase H. In this context, it is also remarkable that the Achaemenid period phase H has also been ascertained in the shrine of Nabu, in the form of a trodden mud level, thus proving that the building was still in use. It goes without saying that such a far-reaching re-dating needs many more arguments than a reappraisal of the interpretative periodization of a small profile. But, on the other hand, it exemplifies how strongly archeological interpretation is biased by historical contextualization in terms of what is plausible.

It is to be hoped that the ongoing archeological investigations in the East Tigris region (Ur 2012), and in particular at Erbil, will provide new data for an improved understanding of Achaemenid Assyria, which might extend beyond the issue of the persistence of Assyrianizing pottery production (van Ess et al. 2012). In this context, it is important to note the increasing use of GIS (geographical information system) applications and remote sensing data processing, which aims for improvement of archeological research at key sites and landscapes within Babylonia and Assyria, in the hope of an early resumption of large-scale systematic excavations.

NOTES

- 1 As defined by the patterns manifested in the capital cities of the Achaemenid Empire in Susiana and Persis.
- 2 See in regard to the problem of the long runtime of this pavement Heinsch and Kuntner (2011: 521–522).
- 3 For further references about Achaemenid column capitals and bases in Babylonia see Haerinck (1997: 30).
- 4 The term is used in accordance with Assyriological practices and spans the period of time from the Late Assyrian to Seleucid-Parthian periods.
- 5 Bergamini's reasoning concentrates entirely on the fluvial sediments found to overlay the river walls south of the Sergami alongside the Euphrates riverbed where floods can naturally be expected to have happened periodically. This fact does not prove, however, that the Euphrates flowed at this point back from the city area in its original riverbed west of Kasr. The quoted work about recent excavations by Iraqi archaeologists does not confirm Bergamini's reconstruction since it reports that the sand-and-earth layers were found below the mudbrick walls.

CHAPTER 18

Syria

Astrid Nunn

Introduction

When the Levant became Achaemenid in the year 539 BCE, it had already been part of a large political entity, the Late Babylonian Empire with her capital in distant Babylon. Following the reorganization under Darius I, an area coinciding approximately with the present-day states of Syria, Lebanon, Israel, Palestine, Cyprus, and Jordan became the Fifth Satrapy “abar Nahar” (in Aramaic). This satrapy with the exception of Cyprus will be the subject of this chapter. The Lebanese and north Israeli coast comprises the core region of ancient Phoenicia.

The archeological remains consist of architecture, ceramic, clay figurines, seals, sculpture, metal implements, and coins. The majority of this material and the most spectacular one was excavated on the coastal strip. The inland was less populated and is therefore today poorer in archeological remains.

City Layout and Architecture

The Cities and the Ports

In spite of the Achaemenid policy of centralization, some of the Phoenician cities retained a local dynasty and Samaria and Judea were partially ruled by local governors. The Phoenician cities flourished because of their key position

between East and West. But unfortunately, due to either the large-scale building activities during the Hellenistic period or the fact that most coastal cities (Sidon, Tyre, Gaza) are still inhabited, it is difficult today to find large Achaemenid areas and therefore to reconstruct a city plan of this time in the Levant. Nonetheless, it seems that, as in Iron Age Palestine, well-planned cities with intersecting streets were the rule. Portions of them can be reconstructed in al-Mina, Beirut, Acco, Tel Abu Hawam, Shiqmona, Tel Megadim, Dor, Tel Michal/Makhmish, Ashdod, and Ashkelon.

Some cities, such as Arwad, Sidon, Tyre, Acco, Tel Abu Hawam, Tel Megadim, Dor, Heshbon, or Lakhish, were protected by a fortification wall of the offset-inset or the casemate type. Most of them date to the pre-Achaemenid era. Large forts or citadels, such as in Rishon Lezion, Tell el-Hesi, Tell Jemmeh, or Tell el-Kheleifeh had a strategic and administrative function.

The prototype of an east Mediterranean harbor consists of one or two natural bays, defensible from rocks or islands located nearby. The natural location of Sidon is marked by four bays. According to the prevailing wind, the harbors could be approached from the north or the south. Minet al-Beyda, Tell Sukas, Byblos, Sidon, Acco, Atlit, Dor, or Jaffa and the islands of Arwad and Tyre were of international importance. They had some undersea quays and moles, which were made out of large stone blocks placed on top of one another without mortar. The mortar technique was invented in the Roman period and serves as a chronological indicator, as these walls are very difficult to date. Shipwrecks of the Achaemenid time have been discovered in Shave Zion, Atlit, or Ma'agan Mikha'el (Nunn 2000a,b, 2001; Stern 2001).

The Architecture

The foundations were made out of rubble, the walls either of stones (Tell Mardikh, Tell Sukas, Amrit, Byblos, Sarafand, Makhmish, Lakhish) or of unbaked clay bricks (Tell Mardikh, al-Mina, Ras-Shamra, Tell Sukas, Tel Megadim, Tel Michal, Ashdod, Ashkelon). Typical of Phoenician architecture is ashlar masonry or bricks laid in headers and stretchers alternating with a fill of rubble. Rusticated stones can be seen in the temples of Byblos and Bustan esh-Sheikh, dovetail joints in Amrit.

Whereas most of the sanctuaries of the Achaemenid period in the Levant are unspectacular, two are exceptional: Amrit, located 10 km south of Tartus and Bustan esh-Sheikh, a few km north of Sidon.

The core building, the so-called "Maabed" in Amrit, is a peristyle of 48–56 m per side (Figure 18.1). It encloses a water basin, in whose center a small niche in Egyptian style rose above the water level. The central cultic place of the sanctuary of Bustan esh-Sheikh was a podium of 60×40.60 m and at least 10 m in height. It was probably built around 600 BCE and extended a century

Figure 18.1 Reconstructed view of the Temple of Amrit (Nunn 2000a, p. 203).

later. Scattered architectural elements may indicate the presence of sanctuaries on it. The first sanctuary was built on the first or on the extended podium in a local Assyrian-Late Hittite style. This local temple was replaced about 390–360 BCE by an Attic temple with Ionic-Karian-Lycian elements. Achaemenid elements, such as taurine capitals, may have belonged to a third contemporary temple (Stucky 2005).

A lot of other installations, such as pools and reliefs, were also part of this sanctuary, which was dedicated to the healing god Eshmun (see below, sculpture, temple boys). A second podium was located in Byblos. The temple on it was a pillar hall of 50×21 m. All the other temples were much smaller and of a very simple plan. A broad shrine can be found in Tell Sukas (level F), Mizpe Yammim and Lakhish (“Solar Shrine”), a long temple in Byblos (“Temple of Yehawmilk”), Tell Sukas (level G1) and probably Mount Gerizim.

The mention of a *paradeisos* in Sidon in Diod. 16.41.5 and several fragments of taurine capital protomes make it probable that the most famous Achaemenid palace in the Levant was the one in Sidon. Currently, everything, from its location to its plan, remains unknown. Small, sometimes fortified palaces were built according to the so-called “open court plan,” which was adopted from Assyria (Tell Mardikh, Acco, Hazor, Tell es-Saidiya, Tell el-Mazar, Tel Michal/Makhmish, Tell Jemmeh). The “bâtiment I” in Byblos recalls the Late Hittite architecture. The “Residency” in Lakhish combines the Assyrian-Achaemenid broad room and court with the Syrian entrance with steps and columns.

Most of the dwelling houses had a very simple plan. More sophisticated was a courtyard surrounded by rooms on three or four sides (al-Mina, Ras-Shamra, Tel Nahariya, Shiqmona, Megiddo, Ashkelon). Those houses could also be storerooms. The plan of the houses in Dor is inspired from the Palestinian “Four-room” type.

Almost nothing is known about the external and interior furnishing and decoration of the buildings. A few stepped blocks probably adorned the roofs of the temples in Byblos and Amrit (Figure 18.1). Benches (Tel Michal) or platforms (“altar” in Tell Sukas and Lakhish, “bamah” in Mizpe Yammim) were placed along the walls. Amongst the widespread devotional objects are the small cubic incense burners, which sometimes bear pictures of men and animals. They probably came to Palestine under Assyrian influence. One of the bronze buckets found in the sanctuary of Mizpe Yammim bears a drawing of Isis and an inscription, according to which the donor made this offering to Astarte.

Large secular buildings in the Achaemenid core land were decorated with glazed bricks and stone reliefs. This was not the case in the western province, although three Phoenician stone reliefs from Arwad and Byblos may have adorned a secular building. They represent a sphinx, griffins, and a lion.

A typology of the architecture of the Achaemenid period in the Levant is difficult to develop. The sanctuaries of Amrit and Bustan esh-Sheikh are unique. The other buildings either refer to different Near Eastern types or are typeless because of their simplicity.

The Cemeteries

The largest cemeteries excavated thus far are in Deve Hüyük, Nayrab, al-Mina, Tell Sukas, Kamid el-Loz, Sarafand, Ahziv, Atlit, Dor, Tell es-Saidiya, Tell el-Mazar, Tel Michal/Makhmish, Gezer, Lakhish, Tell el-Hesi, and Tell el-Farah South. Their for the most part simple earth burials were sometimes faced or covered with stones or stone slabs. More elaborated are rock-cut or cist graves built out of stone walls and covered by stone (Ras-Shamra, Amrit, Gezer and Lakhish, Tell el-Farah South). They could contain a simple stone (Nayrab, al-Mina, Ras-Shamra) or clay coffin (Til Barsip, Shekhem, Tell el-Mazar, Tell Jemmeh). Rock-cut shaft tombs with one or more chambers (Ras-Shamra, Amrit, Sidon, Tyre, Akhziv, Atlit, Dor, Ashkelon, Gaza), in which anthropoid sarcophagi could be deposited (see below), are scattered along the coast. Monuments are rare. In Amrit, the two so-called “maghazil” A and B (spindle in Arabic) are towers on a base adorned with lions and situated above hypogea.

The deceased were lying, without particular distribution between men, women, and children, either on their back, or outstretched on their sides or in a crouched position. Their heads were often oriented to the east. Most of the burial offerings were ceramic vessels. Bronze objects, such as bowls, dippers, strainers, jugs, sticks, pins, tweezers, or mirrors and weapons were signs of wealth (Deve Hüyük, Tell Ahmar, Atlit, Shekhem, Gezer, Tell el-Farah South). The bronze joints of a couch and a stool in Tell el-Farah South are exceptional.

All the deceased were adorned with jewelry, women with necklaces, earrings and pins; men and women with bangles for arms or legs, finger rings and fibula. A rich burial would contain seals, coins (numerous in Kamid el-Loz), bronze implements, and weapons. Of particular interest are the 970 dog burials in Ashkelon.

The Archeological Material

The archeological material is presented in order of quantity. The Achaemenid local ceramic is generally not spectacular and, because most shapes have their root in the Iron-II-Age, the identification of a sherd as Achaemenid is often problematic (Lehmann 1996; Stern 2001). Thin or thick and sometimes carinated bowls, craters, cooking pots, mortaria, jars, hole-mouth jars, jars with basket handles, amphorae, bottles, and lamps allow us to trace settlement during this period in the Levant. This pottery is poorly decorated. The only characteristic feature is the wedge-shaped and reed impressed decoration. Some vases have the shape of Bes.

A much more precise indicator is the imported Greek ceramic, which was found in all larger sites, but on the coastal sites more than inland, as pottery had to be transported from the harbors to the inland sites. Although east Greek and Corinthian pottery was still being imported, from the sixth century BCE on, Greek pottery is mainly Attic (Nunn 2014).

The bulk of Attic pottery consists of plain black glaze ceramic. The oldest Attic sherds in Israel/Palestine go back to 540–530 BCE and belong to the black glaze ceramic and the black figure ceramic types. The export of red figure ceramic began as early as c. 520 BCE, immediately after its invention. The repertoire of shapes is mainly limited to drinking vessels (skyphoi, cups, or cup-skyphoi, bowls, and bolsals), storage vessels (bell crater, calyx crater, and column crater) and vessels for transport of wine, oil, or perfume (lekythoi, amphoriskoi, juglets). Plates and lamps were also relatively numerous. A few Panathenaic prize amphorae have been found. Many other shapes common among Attic ceramics do not occur at all.

The largest number of examples of black figure ceramic comes from the Haimon Painter workshop and his followers, and from the Beldam Painter, who are all of moderate quality. Among the best represented red figure painters is the Pithos Painter. But, along with the average quality, high-quality vessels also found their way to the east. Finally, it should be noted that simple shapes of the black glaze ceramic were locally imitated.

When the Greek ceramic of al-Mina was discovered, L. Woolley, its excavator, and many other scholars were enthusiastic about the “irrefutable” proof of Greek presence on the Levantine coast. However, it turned out that the

relevant store room was not filled with Greek jugs, but with Levantine imitations of Greek jugs. Since then, the focus of mainstream research concerning the presence of Greeks in the Levant has changed. The material and textual evidence for the constant settlement of a significant Greek community is scant. The limited repertoire of shapes and motifs and the fact that the vessels were partly found in store rooms, indicate that the Greek tableware had been deposited to be subsequently distributed and sold. Almost all graffiti found on the Greek ceramic is Phoenician. The Greek influence left a heavy imprint on terracottas, seals, and statues during the Achaemenid time. But this was a phenomenon of fashion which of course presupposes contacts with Greeks, but no large permanent settlement whose design was adapted for certain objects. The cliché, that the Levantine did not like pictures, has been deconstructed. Even if seen from the Attic point of view the quality of the Greek vessels is average, from the local point of view, the Attic ceramic was incomparably more beautiful than the pictureless local variety.

Inner Levantine trade existed. The amphorae used to transport wine or oil in Israel/Palestine were generally not from Attica, but from Phoenicia or eastern Greece.

It is possible to distinguish two main regions for the local terracotta types (Nunn 2000a). They were generally solid, but a few are hollow and molded, sometimes with a stamped face.

The northern region reaches from north Syria to Amrit and includes the inland area. There, the main terracotta types are clay plaques with a woman en face and riders. The women are nude or dressed. They are very often presenting their breasts, or, when dressed, holding their arms alongside their body or carrying a flower on their breasts. Some have a crown or a polos on the head (Figure 18.2). These clay figurines are the subject of a general study (M.G. Micale). Preliminary results hint at the fact that these women with seemingly “Greek” features are more ancient than the nude ones and that they quickly spread under the Achaemenids.

Figures of a male rider were so common that they are plainly called “Persian rider.” But the Syrian types are worthy of special mention as some variations are mostly confined to this region: there are male riders bearing a child, but there are also female riders, some with small added faces, and riding figures sitting under a very dominantly-depicted canopy.

The second large region is situated south of the one aforementioned. Whereas Syria was not very permeable to foreign influences, the Phoenician clay figurines, which are two- and three-dimensional, show an amazing thematic and stylistic diversity. One can observe the fine graduation between local Near Eastern, Egyptian, and Greek elements engrafted on local types. Nude women presenting their breasts, dressed pregnant or breastfeeding women, seated and standing men with different caps, horsemen, or masks

Figure 18.2 Private collection: Terracotta of a woman, H. 15, 1 cm (Nunn 2000a, pl. 11, 15).

were found all over this region, apart from Samaria and Judea. More Greek coined clay figurines show nude youths, men with caps or helmets, and dressed women. It seems that clay figurines were mainly locally produced, very few could have been imported from eastern Greece.

The clay figurines were mainly found in sanctuaries (Lakhish) and their refuse pits called *favissa* or *bothros* (Amrit, Kharaib, Dor, Makhmish/Tel Michal, Tell es-Safi, Tel Zippor, Tel Erani) and rarely in tombs (Akhziv, Atlit).

A few figures are clearly representations of gods, but it is still impossible to identify the majority of them. Whether they represent gods and goddesses or cultic staff, their primary function was to protect, the living and the deceased alike.

Seals can be found as original or stamped on clay. However, in the case of the Levant a high percentage of the originals come from the market (Nunn 2000a; Stern 2001). Seals have been found all over this region, but more

densely on the coast. The neo-Assyrian and Late Babylonian tendency to use stamp seals continues into the Achaemenid period. Only few cylinder seals remained in use in inland Syria and Jordan. Two thirds of the stamp seals consist of scarabs and scaraboids, the others are mainly domes and conoids. The seals can be divided into groups, which are clearly defined according to their style and motifs: Isis, Nephtys, and Horus, other gods, Bes, Herakles, griffins, sphinx, lions are – although stylistically different – typical of the Phoenician and Egyptian groups. The main local Achaemenid motif is the “master of the animals,” who is represented on scarabs, on the bullae of Wadi Daliyeh, and on the large group of the Levantine glass conoids. Graeco-Persian elements remind us of Greek iconography. Seals of the Phoenician group were mostly found on the coast, those of the Egyptian group mostly inland. The Achaemenid and Levantine groups, which are characterized by a poor and repetitive set of motifs, are widespread. Most of the seals are locally made, but some were imported from eastern Greece. The jaspis seals of the Phoenician group find their equivalent in the so-called Tharros group from Sardinia. How exactly the exchange occurred between both shores of the Mediterranean Sea is not clear.

In contrast to the figurative seals, which were for private use, the administration of Juda, Samaria, and Ammon used, as in the Iron Age, seals which only bear an inscription.

Even though around half of the anthropoid sarcophagi were discovered in the necropolises around Sidon, they were fashionable and affordable to the elite of the entire coast between Arwad and Gaza (Frede 2000; Lembke 2001). The Sidonian kings Tabnit and Eshmunazar II fetched two anthropoid sarcophagi from Egypt about 525 BCE. Sidonian production started later – around 480 BCE. These oldest sarcophagi show Egyptian elements, but are stylistically already Greek influenced. However, five clay anthropoid sarcophagi were found in 1996 in a necropole near Amrit. If their dating between 510 and 450 BCE turns out to be correct, the very first imitated sarcophagi may have been made in a Cypriot-influenced style. The four famous elaborated sarcophagi from the Sidonian necropolis, now exhibited in the Archaeological Museum of Istanbul, were made between 425 and 330–310 BCE.

Most of the sculptures were excavated in Amrit and Sidon. The Cypriot statues were mainly imported to Phoenicia between 620 and 320 BCE, a few statues being local imitations. Though they were found along or near the coast from al-Mina to Tell Jemmeh, around 550 out of 650 pieces were found in Amrit. Others came to light with clay figurines in temple favissae (Tell es-Safi, Tel Zippor and Tel Erani). They were offerings, devoted to local deities and placed in sanctuaries. They represent gods and donors, the “master of the animals,” standing men, who are generally dressed, sometimes with offerings and rarely standing women and temple boys (Lembke 2004). A few Cypriot temple boys also found their way to the sanctuary of Bustan-esh-Sheikh. The

Sidonian court sculptors refashioned them after the Greek manner from 430 BCE, creating a new Greek style and new types featuring standing and sitting toddlers and children. The Hellenized production of temple boys and sarcophagi reached its peak between 420 and 380 BCE. The U-formed “tribune d’Echmoun,” which is decorated with gods and nymphs and a hunting relief, testifies to the extreme hellenization of the Sidonian court around 350 BCE.

A few other small statues, whether in metal, stone, clay, or faience, in Egyptian, Greek or local style, have survived.

Of outstanding importance is the stela of Yehawmilk, King of Byblos around 450–425 BCE. The king is represented in Achaemenid court dress in front of his goddess, who resembles Isis but is, according to the inscription, Baalat.

Luxury items made of metal, such as vessels, candelabra, furniture, or jewelry, and weapons, alabaster, and glass have mostly been found in graves. Because of an international Achaemenid style, it is often difficult to be precise as to their origin. The two bronze thymiateria from the graves in Shekhem and Umm Udhaina, respectively adorned with floral elements and a female figurine, give us an idea of temple furnishing. A bronze lion paw found near Samaria points to a royal seat.

The largest number of circulating coins was local, the foreign ones being from Persia, Greece, or Cyprus, (see Chapter 57 Royal Coinage). The main Phoenician cities Byblos, Tyre, Sidon, and Arwad coined money from 470 BCE onward. Each city developed its own iconography. It was Egyptianizing and Phoenician in Byblos, Achaemenid (archer) and Greek (hippocampus and dolphin) in Tyre. The ship and the murex shell commemorate the economic power of Sidon. Attic motifs were imitated in Samaria, where coinage started about a century later. Judean coins bear the name of the province written in Hebrew letters and are therefore called Yehud coins.

Conclusion

The main characteristics of the Achaemenid archeological material of the fifth satrapy are multiplicity, diversity, and eclecticism. Local, Near Eastern, Cypriot, Egyptian, Greek, and typical Achaemenid elements were combined. But, obviously, style is only an external shape, which does not touch on the content of the represented figure. This is especially clear amongst the clay figurines and the seals, on which some themes, such as single women with a child, men, or the “Master of the animals,” are repeated in Egyptian, Greek, local-Phoenician, or local Near Eastern style, whereas their meaning remains identical. It is also evident that only figures or themes, which were either pre-existing in the Levantine culture or easy to integrate into Levantine life,

were chosen. The figurative Attic ceramic provides a good example for this. The pictures on the vessels showed Greek gods, in particular Dionysos, heroes, amongst them Herakles, mythological scenes, mixed beings, and men and women. The broad categories of the divine, the heroic, and the human were understood by the local population. Herakles could easily fit into the image of the “Master of the animals.” The same can be said for mixed beings such as satyrs, maenads, sphinxes, and centaurs. Even if the fashion may have started in royal circles, because Hellenized objects were in part expensive, it was largely accepted and supported by the entire population from 550 BCE onward. The numerous affordable local clay figurines and seals also underwent a phase of hellenization.

Another novelty of this period is the choice of the figurative representations which allow us to draw conclusions about religious changes. If in the second millennium it is already very difficult, due to the lack of attributes or special garments, to identify the gods, by the first millennium it is often impossible to ascertain whether the represented person is even divine. Iconography and written sources allow us to follow the evolution from a “classical” polytheistic religion, where each god is responsible for one domain to a religion, where one god embraces all aspects. Each individual is able to choose his god – the main goal is his personal wellbeing and salute. The idea of protection is predominant in all realms: combined with care (pregnant women), with power (“master of the animals”), or healing (temple boys).

These developments were indirectly fostered by the Achaemenid Empire. The Levant became part of a large territory, whose borders were open to the political center in the east, as well as to the west, where the cultural and economic entwinement increased.

The scarcity of Achaemenid remains raised the issue of an “elusive empire.” But the Levant has always been shaped by a mixture of cultural elements, precisely making its own unique cultural profile. This continues in the Achaemenid period. While Persian dresses, jewelry, furniture, or architectural elements mainly entered the royal and elite circles, they did not change basic elements such as language, religion, or the content of pictures.

The Achaemenid Empire was in reality not elusive in the Levant, even if the coast profited more than the inland, which remained more rooted in the Iron Age. The “lack” of Achaemenid material turns more and more out to be a matter of awareness.

CHAPTER 19

Cyprus

Anna Cannavò

The archeological evidence concerning Cyprus in the Persian period is scanty and scattered. Even if the number of excavations has increased impressively during recent decades, the knowledge of the two-centuries-long permanence of Cyprus within the Achaemenid Empire (c. 525–332 BCE) is still far from being satisfactory. Especially limited is the evidence concerning the relationships between the Achaemenids and the Cypriot kingdoms, and the way they integrated the administrative and tributary organization of the empire; the Cypriot civilization of the Persian period, better known, rarely shows direct and evident connections with the Achaemenid world (Zournatzi 2008, 2011).

Since the beginning of the Archaic period (750 BCE), and more probably even before (Iacovou 2002, 2013a), Cyprus was divided into a number of small kingdoms, struggling against each other for access to primary resources and markets (Figure 19.1). The entrance of the island into the Persian Empire, around or slightly before 525 BCE (Watkin 1987), did not radically change this state of affairs: through their voluntary submission (Herodotus [Hdt.] 3.19.3; Xenophon [Xenoph.] *Cyropaedia* 7.4.1–2 and 8.6.8), the Cypriot kings held the right to strike their own coins (see Chapter 57 Royal Coinage) and to pursue their own political and territorial goals, as long as they did not interfere with Persian interests. The history of the Persian period in Cyprus, as long as we can reconstruct it from the Greek and Cypriot sources, is essentially the history of inter-island conflicts based on internal dynamics (see Chapter 44 Cyprus and the Mediterranean). If sometimes (as in the case of the Cypriot participation in the Ionian Revolt, or the reign of Evagoras of

Figure 19.1 Map of ancient Cyprus. © A. Flammin, Y. Montmessin, A. Rabot/UMR 5189, HiSoMA, MOM.

Salamis) they seem to acquire a wider resonance, we are rarely able to appreciate the Persian attitude toward them. One case is exemplary of our difficulties: the bronze tablet with a long Cypro-syllabic inscription found in Idalion in the mid-nineteenth century, and referring to a siege of the city by Medes and Kitians, is still under debate because of the Persian participation in a territorial attack which would otherwise seem a purely Cypriot internal affair (the last assessment by Georgiadou 2010). Gjerstad's interpretation (1948: pp. 479–481) of the Persian/Kitian coalition as a sign of the ethnic polarization arisen in Cyprus after the Ionian revolt (the Kitians, that is Phoenicians, being allied of the Persians against the Cypro-Greek kingdoms of the island) has been correctly dismissed by Maier (1985), but since then no better explanation has been found.

We can distinguish two main levels of interconnections between Persia and Cyprus during the two-centuries-long Persian control of the island. As the first level, the presence of Persian administrative or military officers, both through the installation of permanent control points, at least during some critical phases, and more often through non-permanent and occasional contacts, is particularly difficult to assert because of the ambiguous and poor evidence. A second level, justifying of the Persian or Persianizing taste of some Cypriot products of this period, is that of the circulation of Persian models or objects (especially some of them, such as metalware, jewelry, and seals: Zournatzi 2008) whose ideological value was particularly interesting for the self-definition and legitimization of the Cypriot elites.

Persian Presence in Cyprus: The Architectural Evidence

Some monumental buildings and structures documented in the western part of the island and dating from between the end of the Cypro-Archaic and the Cypro-Classical I period (that is, the fifth century BCE) are usually considered as the most eloquent evidence concerning the actual Persian presence in Cyprus.

The remains of what seems to be a siege mound discovered in the 1950s outside the northwestern gate of the Palaepaphos city wall (on the *Marchello* hill), are usually taken as the archeological confirmation of Herodotus' statement that after the repression of the Cypriot uprising in 498 BCE, all the rebellious Cypriot cities were besieged, the most dramatic siege being that of Soloi (Hdt. 5.115); the archeological material (ceramics, but also the great number of Cypriot sculptures and votive inscriptions apparently sacked from a sanctuary close to the walls and assembled to raise the ramp) indicates a dating of the mound to around 500 BCE (Maier 2008, Leibundgut Wieland and Tatton-Brown 2019; here Figure 19.2). Nevertheless, the Palaepaphos Urban Landscape Project seems to provide elements which contradict the interpretation of these remains as a siege ramp: the outside face of the city wall, against which the ramp leans, should in fact be interpreted as the inner side, and the ramp could better be considered as a votive deposit (Iacovou 2008, 2013b, 2019). As the urban organization of Palaepaphos is largely unknown, there is

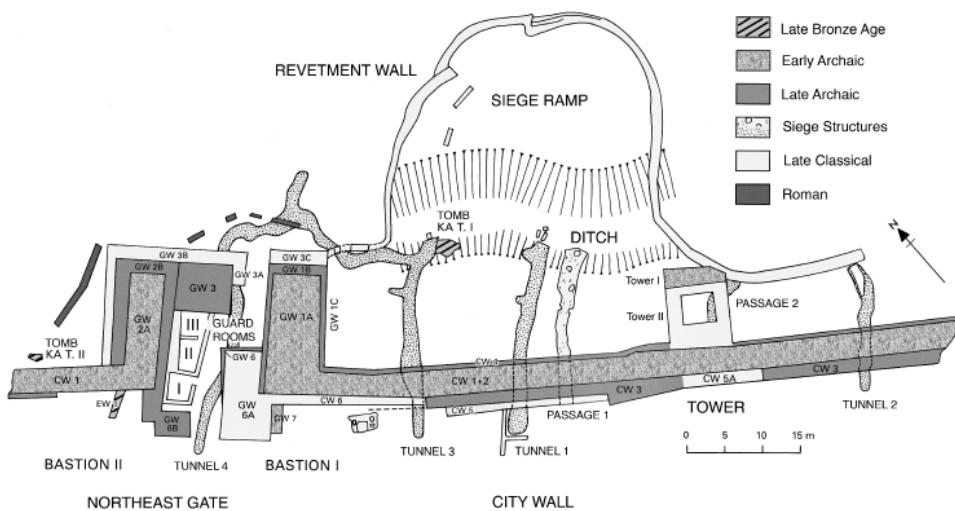

Figure 19.2 The Persian siege ramp at Palaepaphos-*Marchello*. Chronological phases of the fortification. Source: Reproduced from Maier 2008, p. 21 fig. 18, by permission of Swiss-German Archaeological Mission of Kouklia-Palaepaphos; modified by C. Marcks-Jacobs.

still general agreement around the traditional interpretation of the ramp as the relic of the Persian siege of Palaepaphos in 498 BCE, but the Palaepaphos Urban Landscape Project will possibly lead to a complete revision of this as well as other monuments (Iacovou 2019).

As a consequence of the rebellion of almost all the Cypriot kingdoms in the 490s, the Persian presence on the island is supposed to have increased in the years immediately following the repression of the revolt. Two monumental buildings are usually considered to illustrate this presence, both with military and administrative aims: the *Hadjiabdoullah* palace of Palaepaphos, and the Vouni palace close to Soloi.

The remains of a large monumental building, discovered and only partially excavated in the 1950s at *Hadjiabdoullah* (Palaepaphos), have been first interpreted as the residence of the Persian authority (the commander of a garrison?) imposed on the conquered city after the siege of 498 BCE. This interpretation mainly results from the analysis of the architectural and technical characteristics of the palace: ashlar masonry of fine quality; a plan with many small rooms and narrow corridors symmetrically arranged, close to the Achaemenid architecture habits without pointing to specific models (Schäfer 1960). However, since no Persian garrisons are archeologically documented not only in Palaepaphos but in all Cyprus (Petit 1991: pp. 161–169; see however Diodorus [Diod.] 11.44.2 and 12.4.1, which has not to be neglected), it seems more reliable to see in the *Hadjiabdoullah* palace the residence of the local king of Paphos, maybe built even before the revolt (the archeological context dating generically from the Cypro-Archaic II period). After the collapse of the structure before the end of the fifth century BCE, the royal residence was possibly transferred to the site of *Evreti*, where a new, less sumptuous palace (also incompletely excavated) was erected at the same time (Maier 1989a: p. 17). Both sites have been the object of new excavations in the very last years, which will certainly lead to new conclusions in the future (Iacovou 2019).

The Vouni palace (Figure 19.3) is better known. Excavated by the Swedish Expedition in 1928–1929, the well-preserved remains of the ground plan of a large residential building are situated on the top of a hill on the northwestern coast, close to Soloi (4 km to the east) and Marion (40 km to the west). Together with the palace, a sanctuary, fortifications, and necropolis have been found (Gjerstad et al. 1937: pp. 76–290). The large palatial complex has been interpreted by Gjerstad as a control point built by the Persians after the repression of the Cypriot revolt, and occupied by the Persophile dynasty of Marion in order to keep a close watch on the rebellious kingdom of Soloi (Gjerstad et al. 1937: pp. 286–288). Two main phases would be identifiable: the first, running from c. 500 to c. 450/440 BCE, would be characterized by a typical Cypriot (“Eteocypriot”) plan, influenced by Anatolian and

Figure 19.3 Plan of the palace of Vouini, Swedish excavations. Source: Reproduced from Gjerstad et al. 1937, fig. 119, by permission of National Museum of World Culture, Sweden.

Syrian architecture; a second phase, from c. 450/440 to c. 380 BCE, would be marked by the “Hellenization” of the architecture of the palace, combining Cypriot and Greek elements. This interpretation, reflecting, in Gjerstad’s ideas, the political history of the island (the shift to the second phase of the palace corresponding to Kimon’s expedition of 449 BCE, and the rising of an Hellenophile dynasty in Marion), has been radically challenged by Maier (1985: pp. 36–37), and recent studies try to analyze the architecture of the palace underlining its adherence to the eclectic Achaemenid architectural style (Zournatzi forthcoming), and its function as a fortress during the fifth and the beginning of the fourth centuries BCE under the control of the Persians (Hellström 2009) or of Marion (Hermay 2013).

The monetary, gold, and silver treasure found in a coarse jar under a staircase of the palace, and dating from the destruction of the palace, around 380 BCE, adds some interesting elements to the hypothesis of Vouni as a Persian fortress or administrative center. Following a recent proposition (Zournatzi 2017), not only the monetary hoard (composed of 248 minted coins, almost all Cypriot, and four darics) but also the gold and silver objects (bracelets, pendants, bowls, and four pieces of cut gold) would have to be considered as elements of the official fiscal contribution the Cypriot kings had to send annually to the Persian authorities. Particularly relevant to this hypothesis are the three Achaemenid-style silver bowls, which would clearly echo the “tribute bowls” of the Neo-Assyrian times; a stone model of such kind of bowls could be identified in a limestone artifact found in the royal palace of Amathus (Zournatzi 2017: pp. 7–9).

If the Vouni palace is still the only plausible evidence for a permanent official presence linked to the Persian control of the island, other Cypriot palaces of the Classical period can be conveniently cited as elements of comparison for the analysis of the architecture of Vouni, which is most plausibly the original combination of local elements rather than the imitation of foreign models. At Soloi, nothing certain is known: some monumental walls, whose technique and quality suggest a public or royal destination, have been discovered on the northern side of the acropolis, but the interruption of excavations in 1974 has hindered further investigations (Maier 1989a: p. 16). At Polis Chrysochous, the site of ancient Marion, excavations on the *Peristeries* plateau have brought to light the remains of a late Archaic building, possibly a royal palace; some aspects of its plan and construction techniques can be tentatively compared to those of the palace of Vouni (Papalexandrou 2006, 2008). The royal palace of Amathus, excavated since 1975 on the southern hillside of the acropolis has some technical and ornamental elements directly pointing to the Vouni palace (T. Petit in Aupert 1996: pp. 99–107; Hermay 2013). In the inland kingdom of Idalion, conquered around the mid-fifth century BCE by Kition,

the monumental remains of a public building have been identified as the seat of the Phoenician administration of the city in the Classical period (Hadjicosti 1997: pp. 57–60; Hadjicosti 2017; Amadasi Guzzo 2017). For other cities of Cyprus, which certainly had a royal palace – Kition, Kourion, and Salamis – no concrete evidence exists: in what concerns Salamis, it is only possible to cite a double-bull-protome capital of Achaemenid inspiration, discovered out of context in 1890, and possibly Hellenistic (Roux 1980; Petit 1991: pp. 173–174; Zournatzi 2008: p. 241 and note 10, with further references).

Nothing in the archeological material, except the architectural evidence shortly mentioned (whose interpretation is not always obvious), allows presuming a permanent Persian presence in Cyprus: should we believe Diod. 11. 44. 2 and 12. 4. 1, Persian garrisons in the island were short-living, and probably left no real monumental traces. The few Persian objects found on the island – some darics, seals, and metal bowls (Petit 1991: pp. 171 with references; Zournatzi 2008) – can be interpreted as signs of the (limited) circulation of Persian luxury objects in the island, probably through diplomatic or official channels.

Persian Influences on Cypriot Civilization: Emulation and Legitimization

Even without any official, permanent military or administrative center, the Persians certainly had many occasional contacts, for fiscal, military, or diplomatic reasons, with the Cypriot kings. The lack of an actual Achaemenid center within the island did not prevent Achaemenid civilization and material culture from entering and spreading throughout Cyprus, and influencing the cultural tastes of the local aristocracies, eager to emulate foreign elites' habits. This phenomenon, frequently documented in the whole Mediterranean basin throughout antiquity, is attested in Cyprus even before the Persian period, and it is largely independent from the incidental political situation (the Achaemenid domination over the island), but it is the result of a wide and deep circulation of luxury items, values, and ideologies between elites. Hence, connecting Persian influences on Cypriot arts to the Achaemenid control of the island is misleading, and contributes to hide other channels, such as Phoenician or Ionian art, which are, in the case of Cyprus, of the greatest relevance.

Against this background of wide circulation of styles, techniques, and iconographic themes, some Cypriot peculiarities are particularly evident: the limestone and terracotta sculpture, a flourishing art in Cyprus during the late Archaic and Classical periods, allows us to detect their most important

features (Hermay 1989a). Even if more and more influenced by Greek art, particularly since the end of the fifth century BCE, and in spite of the occasional adoption of some Persian elements (Zournatzi 2008: pp. 241–247), Cypriot statues are essentially devoted to worship, and not to funerary practices (as commonly in the southeastern Mediterranean) or to the celebration of heroes and athletes (as in the Greek word). Cypriot statues, characterized by a great attention to the portrait, seem to elaborate Greek technical novelties and to translate them into the local limestone and terracotta products, expression of the devotion to the traditional Cypriot gods (especially in the great sanctuaries of the Golgoi and Idalion region; Hermay and Mertens 2014).

Cypriot elites, the purchasers of the great statues that populated the urban and extra-urban sanctuaries of the island, wished to be represented with royal or noble attributes which were normally taken from the Egyptian and Persian repertoire (Satraki 2013): the Egyptian double-crown with *uraeus* of a limestone head from the Persian siege ramp of Palaepaphos (now in the Liverpool Museum, KA730) is a mark of kingship (Maier 1989b), as is the *mitra*, which A. Hermay has identified on a limestone head of the Louvre museum (AM 2835; Hermay 1989b: p. 223), but which is often represented even on smaller terracotta figurines (Hermay 1989a: pp. 180–181; Cannavò 2010: p. 63 note 71 with references; Satraki 2013: p. 132). The mixed, hybridized character of these figures, putting together Persian, Egyptian, Assyrian, and Greek elements, is particularly evident, and they have been described as an “écho hellénisé de l’image du Grand Roi ou de hauts personnages de l’empire achéménide” (Hermay 1989a: p. 181).

In this perspective, the Cypriot loans to the Achaemenid civilization are several, and not only in sculpture: hoods with lappets, *kandys* (coat with sleeves), *anaxyrides* (long trousers) are represented on small limestone and terracotta figurines together with the typical Persian short sword, the *akinakes* (Zournatzi 2008: pp. 241–242). Representations of torques and earrings of Achaemenid type are known on some numismatic issues of the kingdom of Salamis (Markou 2006; *here* Figure 19.4), representing the king with his royal and sacred attributes: here again, typical Achaemenid elements denoting high status are integrated and reinterpreted to express Cypriot conception of kingship, the legitimacy of the royal status, and the tight link with the divinity (sometimes represented on the right face); in the most ancient issues, this representation of kingship is associated with what is presumed to be a portrait of Evagoras II with a Persian *tiara* (Destrooper-Georgiades 2000: p. 235, pl. 37 no. 7–8; Markou 2006: p. 150 fig. 7; *here* Figure 19.5). The combination of kingship and divinity on Salaminian coins is not fortuitous but represents a central element of the Cypriot numismatic production, the Cypriot kings wishing to express on their coins their legitimate association to their territory

Figure 19.4 Obverse of a gold stater of king Pnytagoras of Salamis. Source: Reproduced by permission of Bank of Cyprus Cultural Foundation.

(through the use of ethnics or symbols) and their privileged relation with the divine element (Hermayr 2006).

Together with the coins and the silver bowls, the Vouni treasure contained four gold specimens of *omega*-shaped bracelets with animals' (goats' and calves') heads finials, which are considered to be a typical Achaemenid product. Found in other regions under Persian control (at Pasargadae, and at Vani, Georgia), similar bracelets are represented (without the animals' heads finials) on the Apadana reliefs as a kind of "court" jewel, apparently produced in different parts of the Achaemenid Empire, with stylistic and regional

variations (Zournatzi 2017: pp. 10–12). It is not impossible that, like the Achaemenid-type silver bowl, the *omega*-shaped bracelets were manufactured specifically for the payment of the annual tribute to the Great King, or as diplomatic gifts: as such, they were supposed to satisfy standard Persian requirements, even within the range of provincial stylistic variations (Zournatzi 2017); the animals' heads' finials, which appear also on the torque of the Salaminian numismatic issues already mentioned (Markou 2007: p. 421), could in particular be supposed to be an element responding to specific Cypriot tastes.

Nevertheless, the lack of any sculptural representation of figures adorned with such jewels – *omega*-shaped bracelets and torques (the torque on the limestone statuette described in Zournatzi 1989 is uncertain) – suggests the greatest caution in what concerns the actual diffusion of such luxury objects in Cyprus. The unique representation of a torque on Salaminian numismatic issues could indeed suggest that this was actually considered, on such an occasion, as a kind of status symbol, denoting the legitimacy of the royal power. The possible identification of the Salaminian king represented on the most ancient issues with Evagoras II acting as a “satrap,” better as a military officer of Artaxerxes in 351, is tempting: with coins representing him on the right side as a satrap, and on the left side as a truly Cypriot king, whose authority is granted by the Achaemenid torque, Evagoras II expressed his will to regain Salamis as its legitimate ruler (Markou 2006: pp. 143–146).

The Persian impact on the political and economic structure of Cyprus was certainly not negligible, but it seems to have been generally indirect and mild. As the Achaemenid authorities were interested in maintaining the local balance of regional powers, which they considered as the best manner in which to assess their super-regional control, they did not interfere, at least not exceptionally, in internal Cypriot affairs, leaving Cypriot civilization to develop along its own patterns. But, largely independent from its political predominance, Achaemenid civilization, especially through luxury and status symbol artifacts, spread throughout the eastern Mediterranean basin, becoming a reference for aristocracies and elites of a wide and diversified area, including Asia Minor, the Levant, and Cyprus. Achaemenid influences entered Cyprus through a variety of paths, some of them direct (occasional presence of Persian agents; diplomatic exchanges; Cypriot participation in Persian military enterprises), others indirect (Ionian sculpture; Syrian and Phoenician art).

The complex, hybridized results of the elaboration of all these elements bear the signs of the quest for a pan-Cypriot identity, having its focal points in a common model of kingship and the relation with the divinity. More detailed, differentiated regional identities, apparent in the archeological evidence during the Archaic period (Fourrier 2007), are difficult to study in relation to the Persian Empire, the data being so limited; but it is already quite evident that the kingdom of Salamis, at least since the reign of Evagoras, played an

important role in the appropriation of some Achaemenid symbolisms for local needs. The western part of the island (Palaepaphos, Soloi, Marion) seems to have been strategically relevant to Achaemenid interests, but the evidence available is ambiguous, and new, detailed studies can radically change our perspective. Even less is known about the relations between Persia and the southern kingdoms of Amathus and Kition, where the great gap in our documentation is still to be filled.

CHAPTER 20

Egypt

Melanie Wasmuth

An essential issue of the contribution at hand concerns the definition of “archeological.” The bulk of Egyptian artifacts classifiable as “archeological” may be labeled “art historical source,” “textual source,” “architectural source,” etc. with equal justification. The advantage as well as the difficulty provided by sources that may be classified as both archeological and textual characterize Egyptian artifacts and Egyptological research: a large amount of “archeological” findings from Egypt are inscribed, e.g. paintings and reliefs featuring legends or integrating figurative and textual elements, inscribed statuary, founding stones, and small finds (such as figurines, sistra), or even pottery inscribed with pottery marks or contents labels. For this brief survey, the corpus of sources is therefore comprised of anepigraph and inscribed artifacts and monuments with focus on their representational, infrastructural, or functional aspects.

A further general issue regarding Achaemenid Egypt is the current state of research: though the period covering the twenty-seventh (i.e. first Persian dominion) to the thirty-first dynasty (second Persian dominion) as well as the continuation into the Ptolemaic period has been the focus of several studies and excavations in recent years, these time spans continue to be a minor focus of Egyptology and are studied primarily by scholars from other disciplines (e.g. Ancient History, Classics, Graeco-Roman Archeology). Therefore, the actual amount of data is comparatively scarce, and in the case of uninscribed objects, stratigraphic information and independent dating are often missing altogether. Even inscribed objects are not always easily dated when the

reigning king's name is omitted – a practice starting already before the Achaemenid period. However, there is evidence from the first Persian dominion, the intermediate period (twenty-eighth–thirtieth dynasty), and the second Persian dominion. Sources are preserved that were made within the Egyptian cultural tradition, within completely un-Egyptian cultural traditions and mixing elements from two or more cultural traditions. Their geographical scope ranges from the region of the modern Suez Canal, northwestern Sinai, the Nile Delta and Valley to its adjacent desert areas and the oases. There are royal, “elite” and “non-elite” sources; representational and functional sources; “state,” temple, and “private” sources; sources in situ, in progress of excavation, in collections, and lost sources (i.e. having been transferred or destroyed since antiquity). Moreover, the sources reveal sacral, funerary, profane, and representational activities. Still unrivaled collections of data are provided by Posener (1936) and Bresciani (1958).

Most of the known sources date, or are commonly dated, to the first Persian period (twenty-seventh dynasty). This is due to the presence of the royal name of “Darius,” although that may refer to either Darius I, II, or III. Fortunately, some of the most monumental and longest-known sources (e.g. the canal stelae), but also private stelae from the Serapeum in Saqqara, can definitely be attributed to Darius I because of the regnal year mentioned. Many other objects (e.g. handles of sistra, vessels, etc.) derive from insufficiently known stratigraphic contexts and should be given an ambiguous date, though they are likely to originate from the much longer first Persian dominion. Accurate dating of non-royal art and architecture is particularly difficult as independent dating criteria are still to be established (e.g. Josephson 1997: p. 14). Statues composed within the Egyptian cultural tradition tend to be dated to the twenty-sixth dynasty because of their “trueness to original”; statues incorporating foreign elements that cannot easily be assigned to a specific cultural tradition are usually thought to stem from the Ptolemaic period. However, without a major project that reevaluates the complete corpus of private statuary from the twenty-fifth dynasty to the Ptolemaic period within its prosopographic context, an evaluation of private representational art under Persian rule remains impossible. Most dating criteria for the Persian period that focus on style or composition can be shown to be under-determined: e.g. the so-called “Persian gesture” and “Persian garment” are neither specifically Persian nor restricted to the Persian period, but can already be found on twenty-sixth dynasty monuments (e.g. Schulman 1981; Vittmann 2009: p. 97). Persian period pottery and “small finds” like amulets pose similar challenges. Even though there is evidence from recent excavations (cf. the discoveries at Tell el-Herr: e.g. Valbelle 1999, and Abusir: Bareš et al. 2005) suggesting a potential Persian period origin, the majority of comparative material is often generally dated to the Late Period (e.g. Müller-Winkler 1987, who omits the

twenty-seventh to thirty-first dynasties from her chronological table of artifacts; see also Aston 1999a with respect to the dating of tombs).

The old scientific paradigm notwithstanding, building and cultic activities in the king's name, continued in all regions of the Egyptian realm: in the canal region with a focus on Persian cultic activities, in the Nile Valley, the Delta, and northwestern Sinai with a focus on the continuation of Egyptian cultic traditions and fortification, and in the oases with boosting cultivation and settlement (see Wasmuth 2017a including the map on pl. I; see already Gamer-Wallert and Schefter 1993). Apart from actual in-situ finds, this can also be deduced from the Achaemenid period quarry inscriptions found in the Eastern desert (e.g. Bongrani Fanfoni and Israel 1994; Posener 1936: pp. 98–130).

One core area of royal monumental display is along the canal joining the Red Sea and the Wadi Tumilat and thus providing a navigable waterway from the Persian Gulf to the Mediterranean. This waterway was reopened under Darius I and marked at strategic points – i.e. the gulf coast (Suez/Kubri), the southern edge of the Bitter Lakes (Kabret/Shallûf), and the junction between the north–south and east–west canal at the northern edge of the Bitter Lakes (Serapeum) – by a monumental stela (the so-called “canal stelae”), but also by a fire altar, and at least one further monument. Accordingly, these locations did cater for Persian cultic/festive/representational functions besides being visible markers of a route of transport (Wasmuth 2017a: pp. 125–199, 263–269, pls. I–III; see also Tuplin 1991; Bresciani 1998; Posener 1936: especially pls. V–XV). At the first major town in the Wadi Tumilat, nowadays Tell el-Maskhuta, a further monumental stela was placed (Posener 1936: pl. IV), which is based on a different master copy. The construction inscription is substantially shortened in favor of a more detailed comment on the legitimacy of the king's rule over Egypt (Wasmuth 2017a: pp. 144–146). While the Kabret and Kubri stelae combine predominantly “Persian” and “Egyptian” faces, the Maskhuta stela has only an “Egyptian” face (Figure 20.1). To date, there is no evidence for an additional stela featuring a “Persian” version (Schweiger 1998: pp. 184–185, 605–608).

Not a juxtaposition as on these stelae but a close combination of Persian and Egyptian elements within one monument or at least one distinct part of a monument occurs in the lists of toponyms on the “Egyptian” faces of the stelae (i.e. Kubri, Kabret, and Maskhuta) and on the base of the by now headless statue of Darius I that was produced in Egypt and transferred to Susa in antiquity (Kervran et al. 1972; Perrot et al. 1974; Trichet and Vallat 1990; *here* Figure 94.8). Rather than choosing the most characteristic gesture, posture, attribute, etc. within Achaemenid and/or Egyptian tradition, the artists went for elements of high representational value and of similar associations, meaning, and functions within both cultures (and, if possible, also within

(a)

Figure 20.1 Reconstruction of the “Egyptian” and “Persian” faces of the Kabret stela. Source: From the Suez canal region; Wasmuth 2017a: Pls. II-III.

(b)

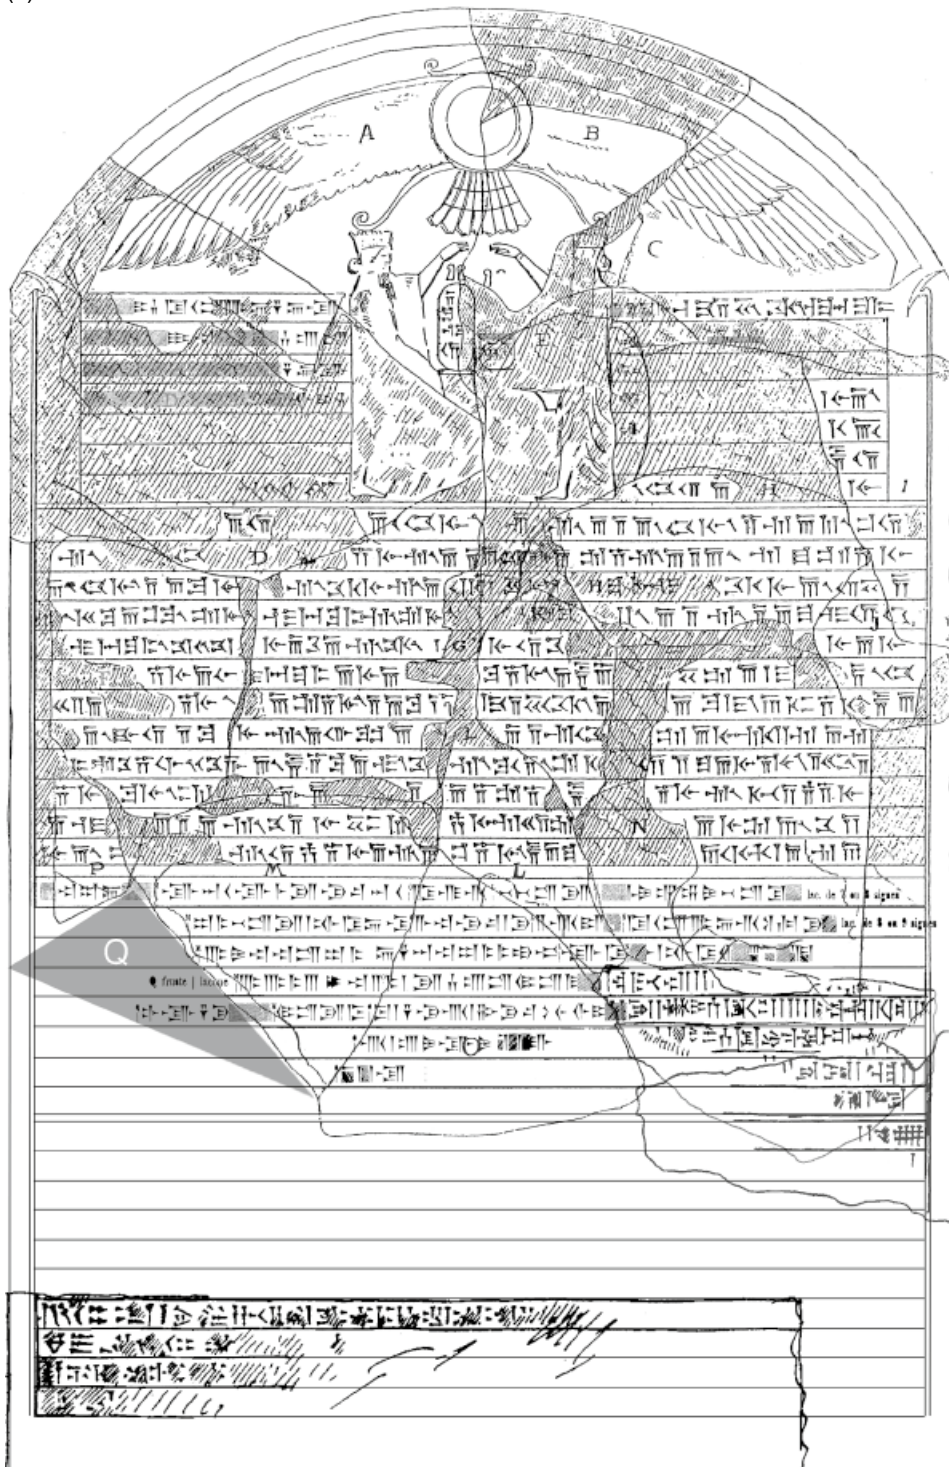

Figure 20.1 (Continued)

Mesopotamian royal tradition; for a detailed discussion see Wasmuth 2017a: pp. 101–124). Its original site of erection is still open to discussion; so far the temple areas of Tell el-Maskhuta and Heliopolis have been suggested (see Bresciani 1998: pp. 103, 110). The same is true for the question of how explicitly the Persian nature of the king was given prominence on this monument: dress and attributes are Persian; the inscriptions are predominantly Egyptian; posture and gesture may derive from either tradition; the head is missing and the headdress can plausibly be reconstructed to have been in either Egyptian or Persian style (as on the coins with depictions of Artaxerxes III wearing Persian court dress and an Egyptian double crown, see Allotte de la Fuÿe 1928 and *here* Figure 20.2, or a Persian crown like several other monumental statues at Susa, see Luschey 1983; see also further reading).

A third strategy of representing the king in his double role as Egyptian pharaoh and Persian Great King works by means of association. It is mainly attested in sacral art stylizing Darius not only as legitimate king of Egypt but also as a living god of the Egyptian pantheon (Wasmuth 2017a: pp. 245–249). On plaques from Karnak, his image evokes the god Hapi (Müller 1970: p. 178; *here* Figure 20.3), and several depictions from the twenty-seventh dynasty temple front in Hibis (Charga oasis) present Darius as living Horus: Darius (identified by a legend) is shown as a falcon receiving “life (*ankh*)” from the gods (Davies 1953: pl. 39). Similarly, Darius in the form of a falcon is worshipped on the stela of Padiuserpare (Vittmann 2003: p. 139 Figure 60; Sternberg-el Hotabi 2009).

The most problematic representation of the king’s cultural double role would have been the canonic scene of the Egyptian king slaying his (Nubian, Libyan, and Asiatic) foes on the pylon front of a temple. This was intentionally avoided at the temple of Hibis by omitting the pylon in the contemporary

Figure 20.3 Darius in the role of the god Hapi. Source: From Karnak; Wasmuth 2017a: p. 248 Abb. 54a.

building plan; a screen wall featuring Darius embedded in the Egyptian pantheon occupies its place at the temple front (Davies 1953: pls. 38–43). However, the right-hand panel conveys essentially the same message as the emblematic pylon scene (Figure 20.4): Darius – who appears in anthropomorphic form with falcon head and plumage – strikes the enemy par excellence

Figure 20.4 Temple front of Hibis avoiding the emblematic “slaying of the foes” scene. Source: Hibis, in situ; Wasmuth 2017a: p. 248 Abb. 54b.

(i.e. the serpent Apophis) with a lance evoking the weapon of the slaying scene (Sternberg el-Hotabi and Aigner 2006: p. 543). Because of the setting and the accompanying legend, this last picture is associated with the god Seth (of the oases and in his function as a god of foreign countries) and is to be read: “Darius, the Persian, who guarantees *maat* by slaying his foes, the living foreign Horus” (Wasmuth 2017a: p. 238, see also pp. 235–238). Interestingly enough, the composition was adapted for Ptolemaic and Roman pylon decorations, where the originally Persian lion accompanies the slaying king (Sternberg el-Hotabi and Aigner 2006: p. 543), and the hybrid depiction as anthropomorphic figure with falcon head and plumage becomes characteristic for “Seth

of the Oases” (e.g. on the walls of the Roman temples at Dakhla oasis, see Kaper 1997).

Apart from these sources of mixed influences, sources within the Egyptian cultural tradition are known (cf. Bresciani 1958; Posener 1936; Willeitner 2003; Curtis and Tallis 2005: pp. 172–173; the series *Excavations at North Saqqâra* of the Egypt Exploration Society, London): for example, parts of Achaemenid Hibis and Ghueita temple decorations (both Charga oasis), evidence for building activities in several temples in the Nile Valley and Delta (Busiris, Karnak, Elkab), the religious epitaphs for Apis (Memphis), the stelae from the Serapeum (Saqqara), the mummies from the animal necropolis at Saqqara-North, and cultic objects such as naoi (Tuna el-Gebel), handles of sistra, vessels (Tanis, Tell Muqdam/Leontopolis, Memphis, Fayyum, Karnak). The only Persian aspect of these instances is a Persian royal name.

Meanwhile, objects of a predominantly Persian character are rare in Egypt. The few examples that point to a Persian background are hard to verify due to a lack of similar corpora of sources from the Persian heartland. Most small-scale objects inscribed in Persian, namely an alabastron, a door socket, and a metal shoe of a carrying pole (Michaélidis 1943), are open to discussion regarding their genuineness due to their unknown provenance and the absence of comparable finds. Yet, there is evidence for Achaemenid metal vessels in the Tell el-Maskhuta Hoard (for similar finds see, for example, Figures 95.2 and 95.3), some jewelry and lion vessels from Tell Muqdam/Leontopolis, and the fire altars in the canal region (see above and Cooney 1965).

Surprisingly, there is no stratigraphic evidence in Egypt for a certain type of Achaemenid vessels usually associated with Egypt: vessels made of calcit alabaster inscribed with a royal label (see Posener 1936: pp. 137–151; Westenholz and Stolper 2002; Schmitt 2001). During the reign of Darius I and in the early years of Xerxes I, the inscriptions follow the Egyptian phraseology: “King of Upper and Lower Egypt, Lord of the Two Lands, *royal name*, he may live eternally; year *X*.” A different contemporary version adds the cuneiform inscription “*royal name*, the king” in Persian, Elamite, and Babylonian. During the reigns of Xerxes I to Artaxerxes III, the Egyptian phraseology is replaced by rendering the cuneiform formula into Egyptian, either as *pr-ʿ3 p3-ʿ3* or only *pr-ʿ3*, thereby transforming the Egyptian vessels into a Persian one with a “royal tag” in four official languages. In comparison with the evidence from the canal stelae and the headless statue of Darius, it is to be postulated that *p3-ʿ3* is the Egyptian rendering of the Persian title “Great King,” therefore labeling the king either as “(Egyptian) Pharaoh and (Persian) Great King” or solely as “Pharaoh” (Wasmuth 2015: pp. 218–224; Wasmuth 2017a: pp. 207–214).

A diversity of cultural traditions as well as idiosyncratic combinations characterizes the non-royal representational sources of the mid-first millennium.

Stelae (see e.g. Vittmann 2009; Bresciani 1958: pp. 177–178) and tombs (see the discussion in Aston 1999a and the series *Abusir* of the Czech Institute of Egyptology, Praha) within the Egyptian cultural tradition face the same difficulties as contemporary statues. When not dated with the reigning king’s name, they tend to be dated to the twenty-sixth dynasty or Ptolemaic period because of their unequivocally Egyptian character. However, at least with the statues of Ptahhotep (Figure 20.5) and Udjahorresnet (Figure 12.1), who are comparatively well-known figures in twenty-seventh dynasty Egypt (cf. Bareš 1999: pp. 31–43; Lopez 2015), it can be shown that non-royal art production for the Egyptian “elite” could be of the finest quality. Less definite is the interpretation of the statues’ significance: although the inscriptions appear to suggest only a partial acceptance of the ruler (Rößler-Köhler 1991: pp. 270–275), Persian decorations are conspicuous. Ptahhotep actually wears a Persian torquet as well as an Egyptian pectoral (Figure 20.5). Albeit possible that wearing the Egyptian adornment was meant as a subtle hint of opposition to the foreign ruler, it seems more convincing to interpret the statue as an act of loyalty toward both rulers: the twenty-sixth dynasty pharaoh who had

Figure 20.5 Statue of Ptahhotep displaying Egyptian and Persian “gold of honor” (unknown provenance).

advanced Ptahhotep in the early stages of his career as well as the foreign ruler who promoted him later on (Wasmuth 2017c).

The amount and state of sources available for determining how the Persian population was represented or presented itself leave much to be desired. Though completely un-Egyptian representations in the round featuring Mesopotamian/Persian elements are preserved, their exact provenance is unknown. Among these are a man carved in ivory, a woman in high relief made of terracotta, and several heads of stone (Traunecker 1995; Vittmann 2003: pp. 151–152). Whether they are to be interpreted as divine, royal or non-royal representations is still a matter of contention. Similar questions surround the terracotta heads from Memphis that feature characteristics of foreigners and probably date from the Achaemenid period (Scheurleer 1974: pp. 83–84).

Much better, though not exhaustive data are available for persons of non-Egyptian and non-Persian extraction as well as for persons of mixed parentage: notably funerary stelae for Arameans, Carians, eastern Ionians, and Phoenicians (Vittmann 2003). At least one example of unquestioned authenticity is known of a person of mixed parentage featuring Persian elements: the stela of Djedherbes (Mathieson et al. 1995; *here* Figure 20.6), son of a Persian father and an Egyptian mother, which in all likelihood dates to the fourth century BCE (Wasmuth 2017b). Probably, the composition of different registers with a mummification scene and a scene of offering/feasting is characteristic for persons of mixed parentage and/or multiple cultural identities. On close examination, the stela reveals an amazing number of different influences – elements of Persian, Egyptian, Aramaic, Phoenician, and Carian cultural traditions have been identified (Wasmuth 2017b). As the outcome looks homogenous, it can be postulated that – at least from the middle of the first millennium onward – workmanship as a stone carver in Egypt could be learned in a variety of workshops that adhered to one or several different cultural traditions.

A continuation of Persian period settlements can be postulated throughout the Egyptian realm. For a preliminary compilation of archeological sites including settlements dating to the twenty-seventh to thirty-first dynasties in Egypt see Wuttmann and Marchand 2005, esp. pp. 102–119. Nonetheless, research of specifically Persian period settlement strata is still mainly restricted to the site of Tell el-Herr in northwestern Sinai and to Elephantine at the first Nile cataract. However, pottery comparable to the Persian period levels from Tell el-Herr have been found in Naucratis, Saïs, and Buto in the western Delta; Mendes, Tanis, Tell Defenneh, and Tell el-Balamun in the Eastern Delta; Tell el-Farama and Keduia in northwestern Sinai; Tell Muqdam/Leontopolis in the southern Delta; Tell el-Maskhuta in Wadi Tumilat; Tebtynis in the Fayyum; Giza, Abusir, Saqqara, Memphis, Mostagedda, Karnak,

Figure 20.6 Funerary stela of Djedherbes showing a combination of several cultural affiliations. Source: From Saqqara; Mathieson et al. 1995: p. 27 Figure 3; reproduced by permission of Elizabeth Bettles.

Thebes, and Elephantine in the Nile Valley; as well as ‘Ayn Manawir in the Charga oasis (Defernez 2001: pp. 5–25, *passim*; Defernez and Marchand 2006: pp. 63–74; Aston 1999b: pp. 213–278, Figure 4). Similarly widespread are the coin hoards dating to the period from the twenty-seventh to the thirty-first dynasty and featuring Athenian and Levantine silver coins (Elayi and Elayi 1993: pp. 282–295; Colburn 2014: pp. 356–358).

Evidence that settlement and cultivation might even have been actively promoted has been unearthed in the Charga oasis. Building and decoration activities at several temples (Hibis, Ghueita, ‘Ayn Manawir) indicate increased administrative and cultic importance of the oasis (Willeitner 2003: pp. 22–53; Darnell 2007). Even more revealing are the findings of *qanat* systems, i.e. above- and below-ground irrigation canals and galleries tapping the artesian water reservoir beneath the Libyan desert. Though the structures themselves still have not been securely dated, the textual evidence from ‘Ayn Manawir suggests their construction to have taken place in the early twenty-seventh dynasty. With the exception of only a few texts documenting earlier settlement activity (but not the use of *qanats*), the texts administrating the use of these irrigation systems do not date before the reigns of Artaxerxes I and Darius II (Chauveau 2001: p. 137). Assuming that this is not due to a research deficit, it can be postulated that *qanats* were in use only then because of preceding construction work (probably during the reigns of Darius I and Xerxes I).

To sum up: the archeological sources from Egypt display a highly strategic approach to royal art. Either Persianhood is not expressed at all (e.g. objects and monuments that follow the Egyptian cultural tradition mentioning the foreign name rendered into Egyptian), or it is expressed through a combination of Egyptian and Persian (and to some extent also Mesopotamian) concepts of royal (or at least highest “elite”) representation. This may be deduced from the conspicuous use of attributes, gestures, and postures denoting similar ranges of meaning in both (or even all three) cultural traditions at the expense of solely royal imagery. Additionally, there is evidence for continuing cult and building activities carried out explicitly in the king’s name in the Suez Canal region, the Delta, the Nile Valley, and the oases in the western desert.

With regard to “elite” self-representation, definite assertions are impossible due to the current state of research. No object of representation can be securely attributed to a Persian official even though representational monuments of persons of mixed parentage and of foreign, non-Persian extraction are known. We may presume that quite a number of Egyptian “elite” monuments are in existence but misdated to the twenty-sixth dynasty or early Ptolemaic period. The few statues that definitely represent Egyptian officials in the service of the Persian administration or the court were fashioned within the Egyptian cultural tradition. They do, however, clearly state the owner’s loyalty by means of specific attributes or inscriptions.

While further research is needed for objects of the “non-elite” population living during the Persian period, the evidence from pottery and irrigation systems suggests a widespread continuation or even promoting of settlements throughout Egypt under the Achaemenians.

CHAPTER 21

Asia Minor

Deniz Kaptan

Recent excavations, surveys, and publications have contributed substantially to the progress of the archeology of the Achaemenid Empire in Asia Minor, yet different perspectives associated with methodological variance in the interpretation of finds and their correlation within the imperial organization persist. The region's fragmented cultural landscape, and the effects of diverse physical geography on communities, need to be reckoned with. Rich archeological data can be found in the expansive literature about the classical sites on the coastal lines, e.g. major coastal Ionian and Karian cities, which have had a long period of excavation history, and likewise publications of sites located inland with Iron Age levels. It should be noted that the conventional terms of art history, the Greek Archaic and Classical periods, overlap the Achaemenid Empire period, and the problems of periodization partially stem from the geographic and sociocultural constructs, the Near East and the Classical world, the boundaries of which are difficult to define in Asia Minor. In the wide territorial span of the Achaemenids, the empire emerges as the connector of diverse communities across the region, notable in the archeological record.

This chapter, organized in geographic order, provides only a glimpse into select studies relevant to the Asian portion of Turkey, excluding the former land of Urartu (Figure 21.1). Illicit excavations and plunder of burials continue to be significant problems.

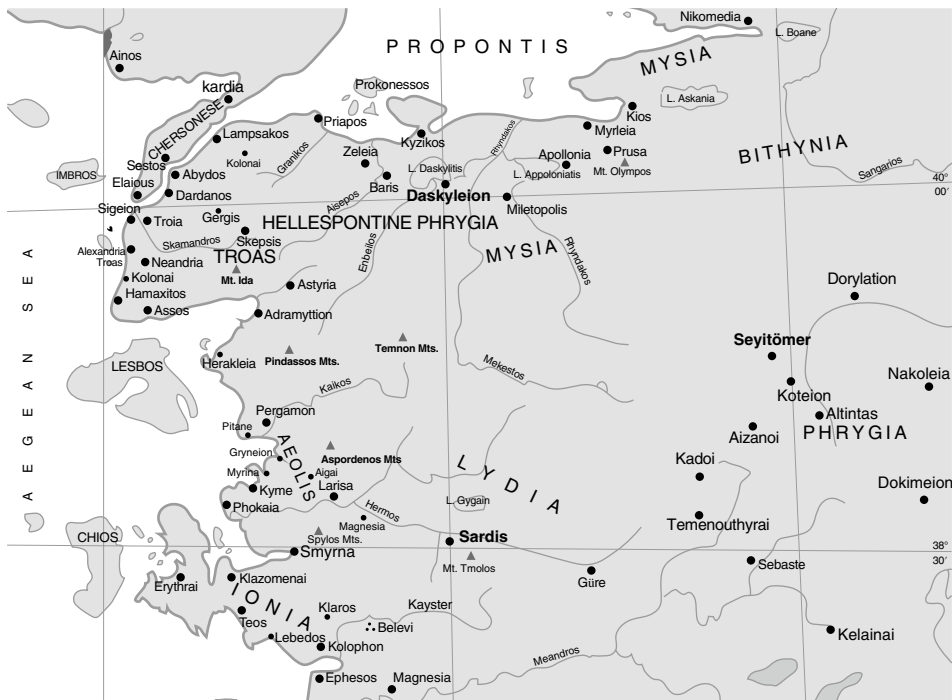

Figure 21.1 Map of northwestern Asia Minor (Deniz Kaptan).

Western Asia Minor

Inland western Asia Minor was the territory of the Lydian kingdom as the Aiolian, Ionian, and Dorian cities were located on the coastal line. The topography of this region comprises fertile river-cut valleys (Kaikos/Bakırçay, Hermos/Gediz, Kayster/Küçük Menderes, and Meandros/Büyük Menderes) and forested mountain ranges (Pindasos/Madra Dağ, Aspordenos/Yunt Dağı, Sipylus/Spil Dağı, Tmolos/Boz Dağ), all oriented in east–west directions reaching the Aegean Sea, dotted by the Aeolian and Ionian cities on the coastline, and the Lydian territory in central western Anatolia. The inland, in particular, was known for its rich mineral deposits, including iron, lead, silver, and gold, as well as marble quarries. This geography with river valleys and agricultural land on the plains contributed to the excellent road network that facilitated communication between the coast and the interior. On the foothills of the Tmolos mountain range, overlooking the Hermos plain, the Bin Tepe, the Pactolos River, and the Gygean Lake lay the city of Sardis, the Lydian capital and a major regional administrative center in the western Achaemenid Empire. Its acropolis stood over by its steep cliffs, rising more than 300 m above the Hermos plain. The site has been excavated since the middle of the twentieth century following the foundation of the Archaeological Exploration of Sardis earlier in the century.

The sack of Sardis by the Achaemenid army has been archeologically well documented. There is impressive material evidence for combats that took place in the streets of the city thanks to the carefully explored destruction debris, especially in the northern and eastern sectors of the city, in the Lydian houses, and under the Roman period theater. Among the finds are the skeletal remains of two warriors in their mid-twenties who died during combat, as indicated by fractures in their skulls and bones. During the chaotic days of the fall of the city, there was clearly no opportunity to give a proper burial to these defeated, presumably Lydians, nor were they robbed for their valuable belongings that included their weapons, a small croeseid, and a bronze and iron helmet (Cahill and Kroll 2005: pp. 590–608; Cahill 2010: pp. 339–357). Cahill cautiously suggests a date for the destruction between 550 BCE, the accession of Cyrus to power, and the conquest of Babylon by his army in 539 BCE.

The urban design of the acropolis comprised terrace walls and stairways built of worked blocks, a large portion of which were eventually recycled in the Byzantine period fortress, but the surviving parts testify to the skills of the builders. Sets of terraces belonged to a system, supporting a number of buildings on the acropolis, which may have included elements of public landscapes such as gardens (Greenwalt 1995, 2011: pp. 1116–1125). The lower city was surrounded by a strong fortification wall covering an area of about 108 ha. So far, excavations have revealed no structure that could be directly associated with the palace(s) of the Lydian rulers and the Persian satraps.

During the Achaemenid period, freestanding monumental tombs emerge in Asia Minor, reaching a peak with the construction of the Maussolleion at Halikarnassos in the second half of the fourth century BCE. The Pyramid Tomb, located on a ridge on the northern slope of the acropolis in Sardis, appears to be one of the first in this category (Ratté 2011: pp. 65, 94–99, no. 15). The structure, the remains of which consist of a stepped platform, was probably never completed. On the platform there would have been a free-standing chamber, possibly with a gabled roof. Based on the building techniques and the masonry, the monument is dated to the second half of the sixth century BCE. An associated monument with a stepped construction and a false door is Taşkule standing on the roadside of Phokaia (Cahill 1988).

Occupation and sanctuaries stretched beyond the city walls of Sardis. One of the extramural sanctuaries belonged to the goddess Cybele, active during the Achaemenid period (Cahill 2010: pp. 100–101). A second sanctuary to the south of the settlement was for Artemis. Its earliest architectural evidence, “the Lydian Altar” situated in the west end of the Hellenistic temple, is a stepped platform comparable to the Pyramid Tomb, but unlike the Pyramid Tomb it is solid, not constructed around a rubble core. A date between the late sixth and early fourth centuries BCE has been suggested (Ratté 2011: pp. 123–125).

The burial chambers of many of the tumuli at Bin Tepe, the Pactolos valley, central Lydia, and those in the Uşak-Güre area display Lydian ashlar masonry; only a few were built out of irregular blocks covered with plaster. The majority of tombs are from between the mid-sixth and mid-fifth centuries BCE, with no significant typological change from the Lydian period; a few show a variety, e.g. three chambers, pitched roofs, flat ceilings, false barrel vault, chambers with dromoi and antechambers (Roosevelt 2009: pp. 148–151).

Among portable artifacts, the deep bowl with high rim as the adaptation of Achaemenid metal original in pottery was widely available in Sardis (Dusinberre 2003: pp. 172–195). The jewelry and seals in the Istanbul Archaeological Museums from Sardis, excavated in the early twentieth century, are from tombs in the close precincts of the settlement (Curtis 1925; Dusinberre 2003: pp. 264–283; Meriçboyu 2010). Besides their artistic value, their well-recorded archeological contexts offer a significant contribution to studies exploring the social environment of their owners. In a similar social context are the retrieved contents of the vandalized tumuli from the Uşak-Güre area, known as “the Lydian Treasure” (Özgen and Öztürk 1996). The assemblage consists of 363 objects: bronze and silver tableware, incense burners, jewelry and seals, tools to make jewelry, cosmetic containers, wall painting fragments, and marble tomb furnishings. In addition to burial customs, these tumuli and their contents in central western Anatolia, including those from Milyas/northern Lycia, provide a glimpse into the lifestyle, social status, self-ascription, and wealth of the elite under Achaemenid rule.

Evidence for territorial military control is exemplarily demonstrated by a fortified stronghold at Şahankaya (Şahinkaya) in northern Lydia, where a lead sling bullet with the name of Tissaphernes was also found (Roosevelt 2009: pp. 118–121). Regional surveys in Ionia have also documented a number of fortified strongholds (Gezgin 2001: pp. 186–188).

Archeological evidence for the peaking prosperity during the fourth century BCE appears to have been demonstrated by the ambitious building activities in Ionia, Karia, and Lycia, some of which is generally attributed to the patronage of the Hekatomnids, viz. the initiation of the Temple of Athena at Priene in Ionia, designed by the architect Pytheos, which most likely took place before the arrival of Alexander. The urban development that has been observed in many of the Ionian cities likely owes its inception to the security and financial stability under Achaemenid hegemony.

Northwest

The land in the northwest consists of fertile plains cut by the rivers Rhyndakos, Enbeilos, Aisepos, and Granikos and two sizable lakes, Daskylitis and Apolloniatis. The rugged and wooded terrain of Mysian Olympus is to the

east. This is an area predominantly settled by Greeks, Phrygians, Mysians, and Lydians. From the nineteenth century onward the region attracted the attention of researchers attempting to locate Daskyleion, the legendary satrapal capital mentioned in classical sources. Discovery of several relief blocks and relief stelai in the area, and surveys focusing on a settlement mound, Hisartepe, near Ergili, gradually led to its excavation as the most likely site of the satrapal center. The stream, Karadere, an outlet of the lake and a tributary of the Rhyndakos, flows by the western slope. To the north is the wetland and the shore of Lake Manyas, a registered wildlife reserve (Figure 21.2). Standing on the mound one catches an impressive glimpse of the lake and the farming land with several tumuli visible in the horizon. This is the view of the fertile plains where small villages and estates of the landowners and the local nobility of the Achaemenid period lay. The port city of Kyzikos, an old Milesian colony, is located about 30 km to the north. This is certainly a good location for communication and trade routes connecting to the Troad and Kyzikos and inland Anatolia.

Ergili/Daskyleion has been excavated since the mid-1950s to the present, with a break from 1959 to 1988 (Akurgal 1961: pp. 170–171; Bakır 2001: pp. 169–180; İren 2010). With levels yielding rich finds from the earlier periods that include “orientalizing” east Greek and Corinthian, Attic, Lydian, and monochrome gray ware, and already surrounded by fortification walls before the Achaemenid period, the settlement mound stands out as a significant source for Iron Age studies. Continuity of spatial use throughout its history

Figure 21.2 View of Lake Manyas from Daskyleion (Deniz Kaptan).

resulted in the recycling of building materials, a matter of fact in settlement archeology not isolated to this site only. The excavation team reports destruction debris from the third quarter of the sixth century BCE possibly associated with the capture of the town by the Persians.

The Achaemenid period settlement had a series of terrace walls built in varying quality and material, the portions of which rise along the southeastern side, one segment reaching a length of 120 m. The northern end of this massive wall, preserved up to 3.75 m high, was built of mudbrick set on a stone foundation of well-worked rectangular limestone blocks. This wall also served as fortification and the upper terrace walls went through repairs and alterations over a stretch of time. The first excavation seasons in the 1950s in the southern sector of the mound revealed some direct evidence for the Achaemenid occupation: the discovery of several hundred bullae with seal impressions in a rectangular structure. It was re-excavated in 2004 (Erdoğan 2007: p. 181). In this area there are several rock-cut pits, foundations of other buildings including a three-unit structure, and a large paved courtyard with drainage (İren and Yıldızhan 2013: p. 213). The excavation team suggests that the satrapal residence/palace with attached units lay in this location. Overall the architecture of this sector is complicated, partly due to alterations and reuse, and partly to the ambiguities in our knowledge about the material evidence for civic and religious practices (Kaptan 2016: pp. 350–354). The architectural fragments of Proconnesian marble and andesite found in spolia clearly indicate that there were exquisite structures and tombs in and around the settlement, the earliest from the late sixth and second quarter of the fifth centuries BCE. They comprise volutes, lintel, and frieze fragments decorated with lotus, palmette, and rosette patterns rendered in the styles of Classical Greek Asia Minor, some attributed to Milesian workshops (Ateşlier 2001: pp. 152–160). Architectural elements also include Lydian painted terracotta tile and revetment fragments similar to those in Sardis. It is possible that such terracotta revetments were used on mudbrick structures with stone foundations, traditionally known in the region. On the northern side of the mound, an area of about 300 m² has been associated with the cult of Cybele.

The finds reveal a prosperous and cosmopolitan center. The pottery sequence, in particular, shows a rich record: Attic pottery was imported in high quantity and regional imitations were also available. Local gray ware, some bearing graffiti, continued to be produced. Adaptations of lobed and plain Achaemenid bowls constitute a significant category in pottery. Fragments of polished stone plates, some similar to those from the Persepolis Treasury and the western Anatolian burials, are among the luxury tableware. There are fragments of ivory utensils carved in animal style, horse-harness strap-dividers in the shape of boars' tusks, and tripartite socketed arrowheads commonly associated with Iranian tribes, and slingshot bullets.

The bullae, largely used on written documents (Figure 21.3), testify to the presence of administrative and economic activity (Kaptan 2002). Similar to the practice known from the Persepolis Fortification and Treasury tablets and the papyri of Arshama from Egypt, the perished documents of Daskyleion most likely recorded economic and administrative operations in and around the satrapal territory, such as records of goods, incoming and outgoing, e.g. grain, livestock, timber, related to the local warehouse/treasury and their management, the ratios and organization of the workforce, and other related issues in the area within the imperial organization. On the satrapal level, the Arshama dossier from Egypt offers an illustrious model for the perished documents of Daskyleion (Kaptan 2020). The seal impressions on the bullae provide a wealth of information about sealing practices and artistic styles. They represent scenes that have direct links to the styles and subjects known from the center of the empire, their regional adaptations, and images in Greek styles and subjects (Figures 21.3–21.6). This is a good cross section of the artistic complexity in the empire, representing images that could be recognized stylistically as Neo-Babylonian, Achaemenid, and Classical Greek, displaying an array of artists' hands at work (Kaptan 2013). The impressions of three discrete cylinders, making up more than half of the entire assemblage of bullae, carry royal names, Xerxes and Artaxerxes inscribed in Old Persian (Figure 21.6), and one bilingually in Old Persian and Babylonian (Schmitt 2002). The users of royal name seals in this regional center most probably followed a parallel practice documented by the royal archives in Iran, and carried out operations in office. There are also Aramaic inscriptions on the impressions of cylinders and stamps (Röllig 2002, Pl. 4). Overall, the inscriptions provide names of Anatolian, Greek, Babylonian, and Iranian origin, showing the seal owners/users who were involved in the transactions of the satrapal

Figure 21.3 Bulla and seal impression from Daskyleion. DS 72 on Erg. 278. Obverse and reverse (Deniz Kaptan).

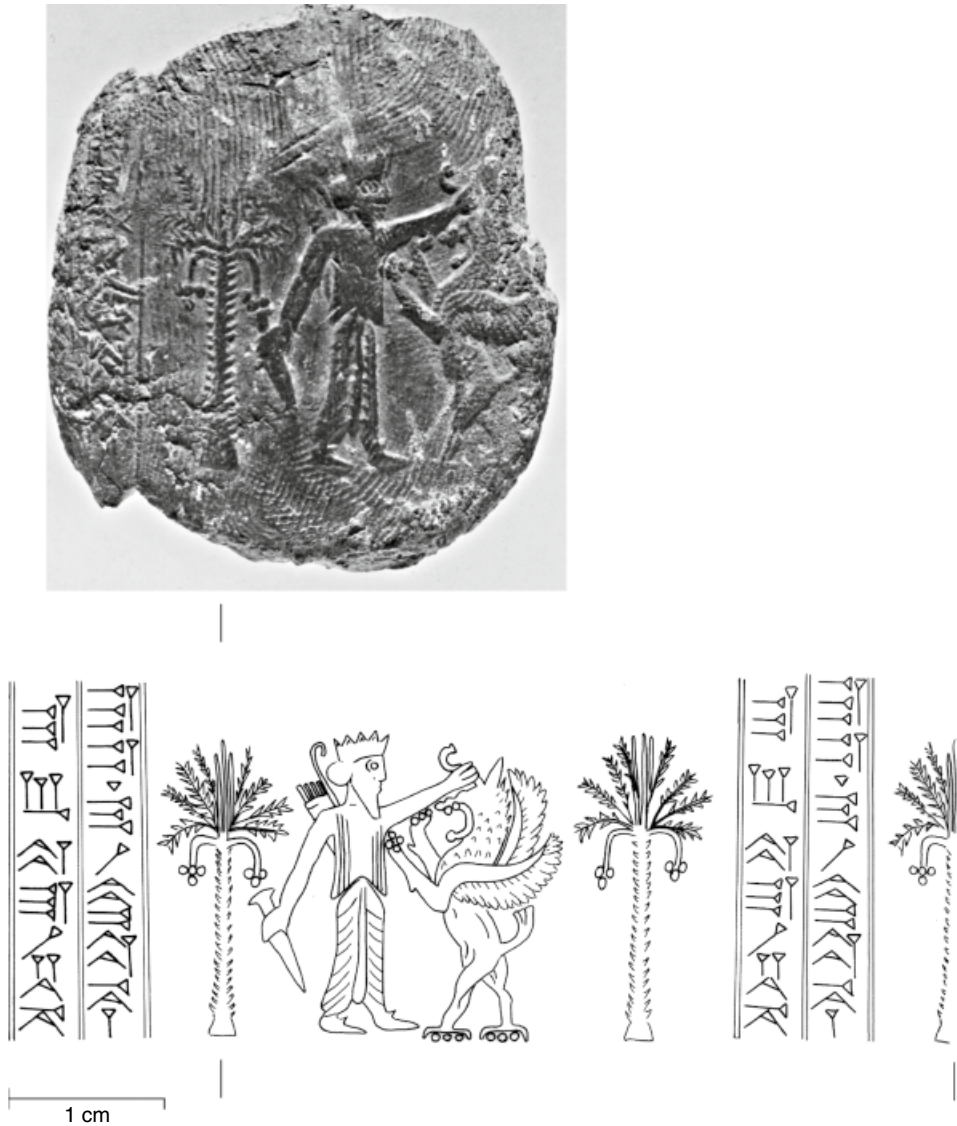

Figure 21.6 Bulla and seal impression from Daskyleion. DS 3 on Erg. 5. cylinder seal impression and composite drawing (after Kaptan 2002: Pls. 9–10).

center and could belong to any ethnic background present in the empire. The variety of artistic styles on the inscribed seals also indicates that the selection of imagery and ethnicity were independent of one another.

The fragments of relief slabs and stelai found around Daskyleion represent convoys, banquets, hunting, and rituals showing priests in long capes and women in courtly settings, some of which bear inscriptions in Aramaic and Phrygian (Borchhardt 1968: pp. 173–179, 192–208; Nollé 1992; Maffre

2007: pp. 230–240; Polat 2007; Draycott 2010: pp. 7–10). They had been removed from their original locations long ago and were reused for many purposes, such as grinding stones and troughs, and blocks in masonry. Their possible connection with the tumuli in the estates of local and Persian nobility has long been suggested.

Recent research in the area has systematically focused on settlement patterns, land use, and spatial organization, and mapped out the locations of burials and possible locations of the estates/farms/çiftliks. The survey team of the Granikos River Valley Project documented a number of sites in the area between the Kocabaş Çayı/Granikos River and Gönen Çayı/Aisepos River (Rose et al. 2007). The surface pottery shows a gap between the end of the Classical/the Achaemenid period and the Roman period, suggesting a significant change in the occupation pattern and land use by the end of Achaemenid rule. As the economy was not controlled by satrapal centers and protection was no longer available in the countryside, the estates appear to have disintegrated and people moved to the newly established Hellenistic cities.

The tumuli, which are often located near water sources and on natural ridges, blending well with the landscape, are emblematic of the prestige and social status of the elite. They also functioned as the markers of estates. At the top, stone balls, *phalloi* set into bases, were placed to mark the monument. Despite the plunder of many of the tumuli, the retrieved contents are sufficient to display the level of prosperity and the owners' affiliation with the empire. Among the numerous tumuli dating from the sixth to the end of the fourth centuries BCE, three burial sites – Kızöldün/Gümüşçay, Dedetepe, and Çan, also those near Daskyleion (e.g. Tepecik, Koru, and Kocaresul) – revealed extraordinary finds. Kızöldün, yielded two marble sarcophagi, one small and one adult size (Sevinç et al. 2001; Rose 2007). Because of its unique relief decoration the large one in Late Archaic style and dated to the end of the sixth century BCE carries significant art historical value. Known as the Polyxena Sarcophagus, it is the oldest decorated stone sarcophagus excavated in Asia Minor. The leftovers of the vandalized sarcophagus include the bones of an adult male, whereas, ironically, the relief decoration of the sarcophagus represents female-dominated scenes. The remains of a wheeled cart were also retrieved. As observed in some other tumuli in western Anatolia, the inclusion of wheels in burials appears to be a part of the funerary tradition. The brightly colored klinai in the chamber of the nearby Dedetepe burial parallel those at Aktepe and Laletepe in the south (Baughan 2008). The retrieved contents of both burials span from heirloom jewelry to wooden furniture that resemble the types in Iran, as well as musical instrument fragments that may have played a significant role in the region at funeral services. The third burial at Çan, also looted, yielded a marble sarcophagus with representations of hunt and battle on horseback. Like the tomb furnishings and spolia at the Daskyleion excavations, these sarcophagi were of Proconnesian marble, the quarries of

which seem to have been easily accessible to those around Daskyleion. Recent work at Daskyleion has also shown the inclusion of rock-cut tombs in burial practices (İren and Kasar 2015).

A small regional center was located at Seyitömer Höyük, about 25 km to the north of Kütahya. This is a strongly fortified settlement mound dating back to the early Bronze Age. The Achaemenid period levels yielded import Attic pottery, local adaptations of Achaemenid bowls in pottery, and a small group of bullae (Kaptan 2010; Coşkun 2015; Grave et al. 2016). The archeological contexts of some of the bullae associate them with a relatively large structure on the mound where subterranean silos for storage were also excavated. The settlement was conveniently located close to the intersection of an ancient route that was clearly in use in the Achaemenid communication network. There are two gaps in its occupation history, one between the end of the Middle Bronze Age and the early fifth century BCE, and the second toward the end of the fourth century BCE and the early Hellenistic period, indicating an evident resettlement during the Achaemenid period, most probably for its convenient location for the collection and distribution of revenues. Overall, the architecture and the bullae suggest the presence of a regional warehouse, located on a key point in the road system that connected northwestern Asia Minor to the inland and coastal areas.

Black Sea Area and Central Anatolia

Several rock-cut tombs in Paphlagonia, some decorated with reliefs, present a variety of types (von Gall 1966; Summerer and von Kienlin 2010). Their precise dating is difficult. Based on similarities to Achaemenid types, the bulls, lions, and winged creatures on the reliefs, as well as animal protomes used as column capitals, the tombs with temple-like façades at Kalekapı in the province of Kastamonu, and Direklikaya near Salarköy/Boyabat probably date from the Achaemenid period if not early Hellenistic with prolonged Achaemenid characteristics. Notable also are a few finds from Oluz Höyük, a settlement mound near Amasya; e.g. pottery bowls with offset carinated rims and Achaemenid period seals (Dönmez 2015, figs. 15–16, 28). Currently, several regional surveys have been mapping out the settlement and land use in this long-neglected area, one specifically focusing on the Achaemenid period (Johnson 2010).

Gordion, the former capital city of Phrygia, has been noted by its excavators as a dynamic settlement during the Achaemenid period even though it lost its famed political position. Its location on the juncture of major routes in the east–west direction played a significant role in maintaining the city’s vibrant life. The arrival of the Achaemenids was documented archeologically by the destruction of the Küçükhöyük fortress. The megaron plan, typical of the Phrygian period, was in use during the Achaemenid period. The production

of goods, bone, stone, ivory, and metal artifacts fed the prosperity, well displayed by the Painted House in architecture and its wall paintings, seals, fine pottery, transport amphorai of import wine, and the use of molded glass vessels in daily use among portable items (Voigt and Young 1999; Jones 2005: p. 116; Dusinger 2005: pp. 24–27, 51–73).

In the Phrygian highland, the architectural remains at Midas City point to the presence of a prosperous town (Haspels 1971: pp. 139–146). The tumbled fragments of the monumental reliefs of a rock-cut tomb, Yılan Taş at Köhnüş valley, impressively show the visual aspects of intricate military identities of the elite during the Achaemenid period (Draycott 2010: pp. 17–19; Haspels 1971: pp. 129–137; Akurgal 1961: p. 306, Figure 19).

The preliminary reports of a recently launched project at Ovaören-Yassihöyük reveal the presence of a significant settlement in Cappadocia (Şenyurt 2014: pp. 101, 106).

Karia and Lycia

The people in Karia and Lycia had complex ethnic backgrounds with connections to Luwians of the Bronze Age, and close contacts with the Dorian settlements in the west. Lycia occupied the rugged terrain of the western Tauros mountains, dominated by two massifs, Massicytos (Akdağ) in the east and Solymna (Beydağ) in the west, both rising steeply from the Mediterranean coast to inland with peaks exceeding 3000 m. To the northeast lie Milyas and Kibyrtis, with the Elmalı plain in the central plateau at an altitude of 1100 m. These mountain ranges and river valleys created natural boundaries within the region itself and played a significant role in the local rulers' (dynasts/*ağas*) control of their local communities, in the service of the Achaemenid king. The region's rugged terrain, however, did not obstruct its communication with the outside world. The local rulers left their mark on the archeological record most visibly through heroa and sarcophagi that reflected their competitive political and social identities in the display of monumentality and themes used in relief sculpture, e.g. the pillar tomb known as the Harpy Monument and the temple tombs, the Nereid Monument in Xanthos, the Gölbaşı-Trysa Heroon, the Heroon of Perikle in Limyra, and the Payawa sarcophagus. People in Lycia also commissioned rock-cut tombs of varying size and decorations, presumably based on their affordability. A recent study documents the rock-cut tombs in the territory of Limyra and demonstrates that they were predominantly produced during the first half of the fourth century BCE (Kuban 2012). The local mint coinage bearing the names of local rulers accompanied by portraits – and subsequently their disappearance later in the fourth century, probably due to the Hekatomnids' rise to power in the regional

administration – as well as inscriptions, including a multilingual in Greek, Aramaic, and Lycian on public display at Xanthos (Metzger 1979; Briant 2001: pp. 17–19), reflect the shifting dynamics in the region quite well.

The urban development in Xanthos during the Achaemenid period showed two different zones: the Lycian acropolis, densely occupied, with monuments and palatial structures, and the fortified city itself with buildings scattered in the empty space. A large elaborate structure in the southeast had a long occupation history, the first phase of which dated back to the seventh century BCE (des Courtils 2008: pp. 1634–1641, 1651; Marksteiner 2005: pp. 38–40).

Regional surveys have documented walls of watch towers and garrisons in strategic points widespread in the region, one for example at Köybaşı, comparable to those at Meydancikkale in Cilicia and Herakleia/Latmos in Karia (Marksteiner 2005: pp. 30, 37).

Lycia provides representations of city landscapes in relief sculpture, showing hilly terrains with pillar sarcophagi on terraces surrounded by fortresses and towers (Jacobs 1987: pp. 61–64; Childs 1978: pp. 10–16). Like the free-standing heroa at vantage points in the Lycian territory, commanding views of the area were chosen also for the tumuli with painted chambers on the Elmalı plain at Milyas. The largest settlement mound Hacimusalar Höyük/Choma is located nearby. The communities of Milyas lived in a contact zone of Lycia, Kibyra, Pisidia, and Phrygia together, and this seems to have found its reflections in the material culture, as illustrated by the painted tombs at Kızılbél tomb, dated to c. 525 BCE and at Karaburun dated to the 470s BCE (Mellink 1978; Mellink et al. 1998). The episodes of banqueting, military victory, funerary rites, and the realia in the paintings of the Karaburun chamber can be viewed as visual expressions of social identity, status, and prestige of the elite under Achaemenid hegemony. The phialai represented on the paintings find their counterparts in silver in the burials of the Achaemenid period (e.g. Uşak-Güre tumuli), as well as in bronze from the Phrygian milieu as demonstrated by the nearby tumuli at Bayındır on the Elmalı plain (Özgen and Öztürk 1996: p. 26). We are again reminded of the Phrygian past by the use of wood for the construction of the painted chamber of the Tatarlı tumulus near Dinar (Mellink et al. 1998: pp. 55–56; Summerer 2007; von Kienlin 2010: pp. 116–119; critical to the Achaemenid impact Jacobs 2014).

The architectural remains at Latmos display well-built fortification walls with 14 towers that enclosed a fort inside, dating from the first quarter of the fourth century BCE (Peschlow-Bindokat 1989). Another survey on the Karian landscape documented 48 sites with fortifications, about a half indicating strongholds, and a quarter with presumably palatial structures including the foundations of a large building at Halikarnassos attributed to Maussollos (Carstens 2011). Halikarnassos, the home site of Maussolleion, the most

well-known structure of the Hekatomnid era, has been explored by a Danish team since the mid-1960s (cf. Jeppesen and Lutrell 1986: pp. 13–113 for the testimonies of classical sources). The sanctuary of Zeus at Labraunda, with its immaculate *andrones* passibly used for ritual banquets, also might have functioned for palatial purposes, as audience halls by the Hekatomnids (Hellström 1991, 1996. Cf. recent work by Henry 2012; Henry et al. 2016). Used as acroteria, the sphinxes excavated in the sanctuary reflect the west Anatolian version of Achaemenid types (Gunter 1995: pp. 21–29). Like Lycia, the chamber tombs and rock-cut tombs in Karia mostly date from the fourth century BCE. The rock-cut tomb at Berber İni/Mylasa and the unfinished monumental tomb at Uzunyuva/Mylasa are exemplary in connecting the center of the empire and the local dynasts conceptually (Henry 2010; Rumscheid 2010).

Cilicia and the Southeast/Middle Euphrates

In the mountainous Cilician terrain, on a rugged hilltop between Silifke and Anamur, is Meydancikkale, ancient Kiršu. The name is mentioned in two Achaemenid period Aramaic inscriptions at the site (Davesne and Laroche-Traunecker 1998; Casabonne 2004: pp. 151–165). Ruled by the family of Appuāšu under Achaemenid control, Kiršu was a strongly protected local residential fort that could patrol the coast and the mountain zone, and manage the exploitation of timber resources. Some of the reused blocks, associated with a large structure, display reliefs reminiscent of the gift bearers represented in the reliefs of Persepolis. Images on Cilician coins issued predominantly between c. 450 and 375 BCE reflect the complex sociopolitical connections in the region.

Kinet Höyük near Issus plain was a fortified settlement during the fourth century BCE. A large mudbrick structure dated to c. 400 BCE bears similar features to those at Oylum Höyük near Killis and Hacinebi at the Birecik Dam area (Gates 2005: pp. 61–62).

Excavations of the earlier levels of Dülük Baba Tepesi by the sanctuary of the Roman god Jupiter Dolichenus, 10 km from Gaziantep, revealed that the hilltop of the site was already in use as a sanctuary earlier during the Iron Age (Schachner 2011). An Achaemenid-type bull capital of basalt, found in a fill, has been associated with a large structure that served as a main building in the sanctuary. This area also yielded rich finds consisting of seals and jewelry in Neo-Babylonian and Achaemenid styles.

The cemeteries at Tilbes and Hacinebi at the Birecik Dam area on the Euphrates, which yielded seals, jewelry, and pottery, appear to be contemporary to the Devehüyük cemetery (Gil Fuensanta and Crivelli 2010; McMahon 1996; Moorey 1980). The settlements at Tilbes, Surtepe, and Hacinebi show

no sign of destruction in the beginning of Achaemenid rule, nor after their demise, suggesting relatively smooth transitions to alternative hegemonic establishments. Excavations in these settlements revealed significantly large structures that were in use during the Achaemenid period. The structure at Surtepe, with mudbrick walls preserved up to 3 m in parts, finds its nearby counterpart excavated at Mezra Teleilat, located 7 km to the south of Birecik (comparable architecture also at Tille: Blaylock 2009). It is an impressive building with magazines and storage units that had access to a large courtyard in the middle (Şenyurt 2006). Fragments of tablets in late Neo-Babylonian cuneiform were found on the floor. This mudbrick structure appears to have served as a regional residence and a warehouse where revenues were stored and presumably distributed in the middle Euphrates area.

CHAPTER 22

Caucasus Region

Florian S. Knauss

While the written sources referring to the Caucasus in the Achaemenid period are widely quiet (Lordkipanidze 2000: pp. 4–7), the archeological evidence from the region south of the Great Caucasus is strikingly rich. The countries north of this mountain range, i.e. Dagestan, Chechnya, Ingushetia, north Ossetia, and the Kuban region, may be omitted here as we lack discernible Achaemenid remains from there, and the Persian domination of this area was certainly brief (Jacobs 2000, 2006).

According to Herodotus (3.97), in the fifth century BCE the Persian rule reached as far as the Caucasian mountains. While “Armina” is already mentioned as a Persian satrapy in the Bisotun inscription, the territories of the former soviet republics of Georgia and Azerbaijan, as well as the northern part of Armenia, became part of the empire at the latest when the Persian army marched through this region during Darius I’s disastrous campaign against the Scythians in 513/12 BCE. The Caucasus formed the northern border until 330 BCE (Gagoshidze 1996: pp. 125–126; Jacobs 2006; Knauf 2009: pp. 299–300; contra Hewsen 1983: p. 128; Lordkipanidze 2000: pp. 9–11; Bill 2010: pp. 24–25).

Already in the nineteenth century spectacular finds attracted the interest of scholars, the best known being the Akhalgori and Kazbeg treasure (Smirnov 1909, 1934; Boardman 2000: p. 191 fig. 5.73; Lordkipanidze 2001; Summerer 2006), often including Achaemenid metal vases and jewelry. Gagoshidze was the first to emphasize the important role of the Achaemenids in Georgia (1979) and treated the time of the Achaemenid Empire as a distinct

and important period in the development of Georgian art and architecture (1996). Tsetskhladze (1993/1994, 1994, 2001) has been very generous concerning the attribution of items to Achaemenid workshops. Armenian research mainly focused on Urartian monuments, whereas the Achaemenid era was fairly neglected. Even from major sites the evidence from the period of Persian domination has been published only briefly (Oganesjan 1961, 1980; Martirosjan 1974; Zardarian and Akopian 1994; Santrot 1996: pp. 178–179, 187–189, 196–203, 208, 212, 222–223; Ter-Martirossov 2001; Kanetsyan 2001). Recent investigations (Badalyan et al. 2008; Heinsch et al. forthcoming) may help to improve the situation. For the western part of Trans-Caucasia – belonging to Colchis and Armenia in antiquity, now Turkish territory – there is hardly any archeological evidence available. For Azerbaijan, diachronical overviews as well as detailed studies of single sites are still lacking. For the time of Achaemenid rule most of the country is *terra incognita* until the present day (Chalilov 1985; Schachner 2001: pp. 298–320). A few years ago (Knauss 2005a, 2006) I gave an account of relevant sites as well as important findings and results from the Caucasus. In the meantime, excavations have enlarged our knowledge significantly. Yet, the actual state of research still suffers from a considerable imbalance of archeological investigations. For a long time scholars emphasized the feebleness of Achaemenid traces in archeological records. The Achaemenid imprint was hardly visible in most of the provinces. All the more impressive are the archeological findings in the Caucasus (Figure 22.1), in particular in Georgia. Since the fifth century BCE precious luxury goods such as glass phialai, so-called Kohl-tubes, as well as stamp- and cylinder seals, can be found in rich Colchian and Iberian burials (Makharadze and Saginashvili 1999; Gagošije and Saginašvili 2000: figs. 1.1–6, 2.3, 3.1–2; Knauss 2006: p. 85 figs. 7–8; Dzhavakhishvili 2007; Kakhidze 2007). They had been produced in Achaemenid workshops in Iran, Asia Minor, or the Levant. Even metal fittings, remaining parts of wheels belonging to an Achaemenid type of chariot, have been found in a burial at Uplistsikhe in Iberia (Kipiani 2000; Knauss 2006: p. 92 fig. 15). From the late sixth century BCE indigenous potters adopted technological inventions as well as new shapes from Persia (Gagoshidze 1996: p. 125; Ludwig 2010: pp. 103, 109–112). In late Achaemenid times we find imports of “classical triangle ware” as well as locally made small jugs imitating the shape and decoration of Iranian prototypes. However, Persian gold and silver objects outnumber all other categories of eastern luxury. Possibly as diplomatic gifts, some of the characteristic Achaemenid bracelets and silver vessels reached the Caucasus (Treister 2007: pp. 83–92; Knauss 2009; Miller 2010). Several items may have found their way to ancient Georgia by trade. Especially in Colchis, rich burials often contained Greek imports, mostly pottery (Sens 2009), but sometimes we find Attic vases together with sumptuous Achaemenid tableware (Kakhidze 2004).

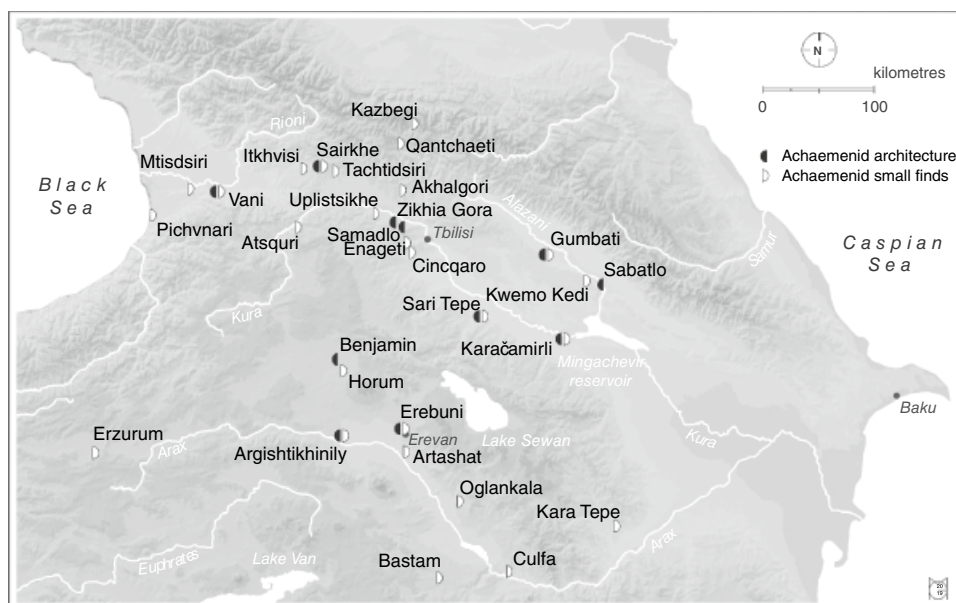

Figure 22.1 Achaemenid and Achaemenizing monuments in the Caucasus.

By and by, local Colchian and Iberian products, painted pottery, gold and silver bowls as well as jewelry show significant influence from Achaemenid models. It is obvious that the local aristocracy was keen on prestigious luxury items fashionable among the Persian elite at that time in order to set themselves apart from the ordinary people. However, the demand for Persian (as well as for Greek) luxury goods soon overtook supply. No wonder that the highly developed Colchian gold- and silversmiths produced copies as well as local variants of the Persian vessels and jewelry (Gagoshidze 1997; Boardman 2000, 196 figs. 5.80, 5.83; Knauß 2009).

Already the famous horse-shaped pendants from the “Akhagori treasure,” a rich burial of a woman, are of local production – for instance, the abundant use of granulation, the net pattern as well as the triangles on the back of the horses find no match in Achaemenid jewelry – but the Colchian goldsmiths had Achaemenid models in mind as the horse breed, the battlement pattern on the rim of the base plate, and the lobes on the breast of the horses betray (Smirnov 1934: pp. 23–29 Pl. 3.26; Gagoshidze 1997: pp. 135–136 Pl. 23.1; Knauß 2009: pp. 292–293 Pl. 1.4).

Gold diadems comprised of a twisted rod terminating in two rhomboid plaques and fastened by a central hook are a Colchian innovation. The iconography, however, repoussé decoration with animal combat scenes, is very much indebted to eastern, namely Persian, models (Kacharava and Kvirkvelia 2008: pp. 82–83 figs. 2–3). A silver rhyton with a goat-shaped protome was

found in a burial in Mtsdziri which can be dated to the fourth century BCE. Typologically it comes close to Achaemenid prototypes, however, some ornaments – cable pattern, ivy tendril – are of Greek origin. This combination as well as some local features – an indigenous mythological creature, triangle pattern – make sure that the rhyton from Mtsdziri has been worked by a local craftsman (Knauß 1999a). In the case of the golden bracelets, Achaemenid panthers or ibexes for the endings are sometimes replaced by wild boars (Knauß 2009: p. 294 Pl. 1.7).

Most of the metal vessels in Colchian tombs probably have been manufactured in Achaemenid workshops in western Anatolia (Miller 2007, 2010; Treister 2007: pp. 83–92. 97–101; Knauß 2009: pp. 294–299). There are goblets, rhyta, and numerous phialai with almond-shaped embossing, lotus palmettes, stylized swan heads. However, some pieces were made by local craftsmen, who copied such imports. After a while, they created new shapes and motifs combining foreign and local elements (Kacharava and Kvirkvelia 2008: Pl. 44b, 45b–c; p 209 no. 26; Treister 2007: figs 8, 9; Knauß 2009: pp. 295–296, 298, 299 Pls. 2.3; 3.5).

The Armenian delegation on the reliefs of the Apadana stairway is carrying metal amphorae with two griffon-handles. Hence, we may suppose that such typical Achaemenid vessels have been made in Armenian workshops. In fact, there are a few Achaemenid metal bowls, rhyta, and bracelets in Armenia (Santrot 1996: nos. 180–185, 194; Boardman 2000: pp. 187–188 figs. 5, 68. 69); however, at least the pottery does not display a similar external influence as in Colchis or Iberia.

From several sites in western and central Azerbaijan we know ceramic bowls of local manufacture which resemble Achaemenid prototypes (Narimanov 1960: fig. 3; Ismizade 1965: p. 215–217 fig. 19.1–3; Furtwängler 1995: fig. 15.6; Knauss 2006: pp. 98–99 fig. 19; Babaev and Knauß 2010: figs. 29.1–4). Therefore, we may assume that Persian luxury was prevalent here, too. Unfortunately, no extensive cemeteries of the Achaemenid period have been excavated in Azerbaijan so far.

The pottery as well as precious objects give ample proof of close contacts of the Albanian, Colchian, and Iberian population with the Achaemenid Empire. Nevertheless, these items may have found their way to the Caucasus through trade or as diplomatic gifts. They do not necessarily signify Persian presence in this region.

The value of monumental architecture is entirely different, especially since recent excavations have shown that the Iron Age architecture in central and eastern Georgia, i.e. Iberia, before the arrival of the Persians was rather modest (Knauss 2005b). The situation at least in western Azerbaijan seems to have been similar.

On the outskirts of Kazakh, Azerbaijan, in the Kura valley, the western part of an extensive structure was uncovered in the 1950s at a site named Sari Tepe. The outer walls with casemates, towers, and protrusions on its exterior lend this building a fortificational character; however, limestone column bases show that it was not a fortress. Several features remind us of oriental models. Bell-shaped bases of a type well known from Susa and Persepolis as well as the pottery confirm that the builder-owner in Sari Tepe had close ties with Achaemenid Persia (Narimanov 1960: p. 163 fig. 2; Kipiani 1993: Pl. 2–4).

Excavations at Karacamirli, a village near Shamkir in the Kura valley, approximately 80 km east of Sari Tepe, revealed a huge architectural complex of the fifth century BCE. An impressive mudbrick building (Figure 22.2) adorned with limestone column bases – bell-shaped (Figure 22.3) and torus bases – has been uncovered on a small mound called Gurban Tepe in the center of a walled area measuring 450 m × 425 m (Knauß 2011: pp. 399–407). A propylaeum on Ideal Tepe formed the gorgeous entrance to this area. Here, again, we find fine bell-shaped limestone bases (Knauss et al. 2010: figs. 3–4). A comparison with the Hadish, the private palace of Xerxes I at Persepolis, leaves no doubt that the great building on Gurban Tepe served as the palace of a Persian magistrate. The monumental gate house on Ideal Tepe likewise followed prototypes from Persepolis; it copied the ground plan of the so-called Central Building (Knauss et al. 2010: p. 117 figs. 2, 8; Knauß 2011: pp. 404, 406; Knauß and Babaev 2016). After they had passed through the propylaeum, visitors crossed a garden (*paradeisos*) before they entered the palace from the east. Chance finds of architectural sculpture indicate that there were even more monumental buildings in the vicinity. Some of them have been partially excavated: a storehouse on Rizvan Tepe some 750 m southeast of the palace, a large rectangular structure with columns in the southern front 300 m north of Gurban Tepe, served as residential building, whereas the ground plan and the purpose of a mudbrick building 900 m northeast of the palace remain unclear. Finally, a geomagnetic survey has revealed a large rectangular building near the northwestern corner of the enclosing wall (Babaev et al. 2009: pp. 316–317 fig. 4; Knauß 2011: p. 406 fig. 15). Despite the impressive analogies to buildings in Persepolis, the spacious architectural ensemble at Karacamirli rather reminds us of Cyrus' residence in Pasargadae. While in the vicinity, some older settlements of the local population apparently were abandoned in the late sixth or early fifth century BCE, contemporaneously with the palace pit houses were built on virgin soil just 950 m north of Gurban Tepe at a place called Dara Yatax. It is obvious that the Persian conquerors enforced a kind of *synoikismos* in order to have enough labor force available nearby.

The older indigenous architecture lacks not only the monumental size and complex ground plan but also a number of constructional details of the

Figure 22.3 Gurban Tepe: bell-shaped column bases.

such magnificent buildings. Ground plans as well as column bases and capitals show that the builder-owners had close relationships to Achaemenid Persia; architects and craftsmen must have been trained in Achaemenid workshops at least.

In eastern Georgia we find similar structures as in western Azerbaijan. The remains of a monumental mudbrick building in the Alasani valley at a site called Gumbati bear resemblance to the palace on Gurban Tepe at Karacamirli situated just 70 km to the south (Furtwängler 1995; Furtwängler and Knauf 1996; Knauf 2000). The bell-shaped column bases from Gumbati show marked similarities with bases from the site in Azerbaijan. Petrological examinations have proven that both of them come from the same quarry.

In Sabatlo, situated midway between Gumbati and Karacamirli in the Alasani valley, at an important junction chance finds of fine column bases hint at another important Achaemenid center.

Further west, in Zikhia Gora, central Georgia, a fragment of a column base of the same type came to light (Kipiani 1987: pp. 6–11 Pl. 2–5; Zkitiřvili 1995: pp. 88–89 figs. 5–6; Gagořidze and Kipiani 2000). More interesting is a bull-protome capital from this site. It is a provincial adaption of prototypes well known from Persepolis and Susa. The dating of this capital still is a matter of debate (Knauf 1999c: pp. 180–181).

In the late fifth or early fourth century BCE a tower was erected in Samadlo, central Georgia (Gagoshidze 1979, 1996: p. 130 fig. 3). The building recalls Achaemenid models such as the Zendan-e Sulaiman in Pasargadae and the Kaabah-e Zardusht in Naqsh-e Rostam. The archeological context supports a religious function of the tower in Samadlo.

Unlike in Georgia or Azerbaijan there already existed a local tradition of monumental architecture at least in the southern part of Armenia. The Urartian fortress Erebuni is situated on the eastern outskirts of Erevan. According to the archeological evidence, the fortress had not been destroyed at the time of the fall of the Urartian Empire, whereas Karmir Blur (Teişebai URU) on the northwestern border of Erevan, residence of the Urartian governor of Transcaucasia, was razed to the ground and abandoned in the second half of the sixth century BCE. It may be that in the southern part of Armenia a number of former Urartian residences has been reused with minor modifications during Achaemenid rule. This has been claimed for Erebuni and Argishtikhinily (Ter-Martirossov 2001; Kanetsyan 2001). However, recent investigations have raised serious doubts whether Erebuni was an important administrative center in Achaemenid times (Stronach et al. 2010: p. 126).

The situation was different in the northern part of Armenia beyond the boundaries of the former Urartian Empire. There must have been an important Achaemenid administrative center at Benjamin, about 10 km southwest of Kumairi (Zardarian and Akopian 1994: p. 187 fig. 6; Santrot 1996: pp. 187–189; Ter-Martirossov 2001: pp. 158–161). The shape of the column bases, worked in local black tufa, is reminiscent of the finds at Sari Tepe, Karacamirli, and Gumbati.

Bell-shaped column bases are exclusively known from the Achaemenid era and only within the Persian Empire. Outside the major centers in Iran and Babylonia the only findspot so far is the Caucasus (Knauf 1999b: p. 104 fig. 15), nowhere else within or beyond the borders of the vast empire.

The discovery of monumental architecture (Kipiani 1987, 1993), closely related to models from the center of the empire, proves at least temporary Persian presence on the northwestern border of the empire. The distribution of sites with Achaemenid architecture (Figure 22.1) suggests that there existed a kind of network of administrative centers. As the capital of the satrapy (Armina?) must have been somewhere else (at Van Kale?), the resident of the palace in Karacamirli certainly was a Persian magistrate below the satrapal level (Khatchadourian 2016: pp. 146–150). But how can we explain the enormous size and grandeur of the building on Gurban Tepe? Xenophon (*Anabasis* 4.4.2) reports that the satrap Orontes had a palace (βασιλείον) in a village in Armenia. Maybe the palace served as the satrap's residence when he stayed in Karacamirli during a journey through the land under his control.

The Persian residence in Karacamirli is a clear instance of *imitatio regis* which Xenophon mentions in his *Kyrou paideia* (8.6.10–14). The edifice on Gurban Tepe is the largest ancient building in the whole Caucasus. Moreover, genuine Achaemenid architecture on the periphery of the empire is most remarkable, since there was hardly any similar building outside of Persia until recently. To this day we are completely lacking excavated satrapal palaces all

over the Achaemenid Empire. Karacamirli may help us imagine their appearance. However, in other parts of the empire where the Persians met with developed cultures (e.g. in Babylonia, Egypt, Anatolia, Syria), the conquerors refrained from implementing their architectural models; instead, local traditions dominated (Knauf 2011: pp. 406–407).

The sheer number of Achaemenid and Achaemenizing artifacts found in Georgia is striking and it reflects a paradigmatic process of acculturation of the Colchians and Iberians. The local elite tried to copy the luxurious lifestyle of the Persian noblemen. Probably, it was not necessary to introduce the habit of the symposion in this region. However, the Colchian aristocracy appreciated the Persian (and Greek) paraphernalia. Furthermore, the iconographic evidence shows a spread of the oriental practice of balancing wine bowls on the fingertips (cf. Xenophon, *Kyroupaideia* 1.3.8–9). Such an attestation of Persian drinking manner can be found on a recently discovered silver belt as well as on the famous fourth-century gold finger-ring with the inscription “Dedatos,” both from Vani (Kacharava and Kvirkvelia 2008: pp. 41–42 fig. 17 [reversed image]; Sens 2009: p. 199 Pl. 53.4; Knauf 2009: p. 299 Pl. 3.6).

Future research in Georgia might concentrate on possible trade routes. In the light of silver phialai from workshops in Lydia especially, the archeological exploration of southern Georgia, e.g. in the Mtkvari River valley (Licheli 2007), and in southwestern Adjara seems to be promising. Of course, investigations in northeastern Anatolia would help significantly to complement our knowledge of the Caucasus in antiquity.

The lack of a similarly impressive archeological record in northern Armenia and Azerbaijan may be explained by a lesser degree of archeological fieldwork. An interesting site is Oglankala in Nahicevan. It is one of the largest late Iron Age fortified sites in Azerbaijan. The preliminary analysis of the pottery suggests a date in the time of the “Median” or Achaemenid Empire. There has been a monumental edifice with a hypostyle hall (Schachner 2001: pp. 310–311, 313, 318 fig. 42–44; Ristvet et al. 2009, 2012), yet, its dating remains doubtful.

The Persian impact on the material culture of ancient Georgia is impressive. We may suppose that the situation in Azerbaijan was similar; however, the sparse archeological evidence makes any judgment unwise. A close investigation of the local settlement at Dara Yatax in the vicinity of the Achaemenid palace in Karacamirli might help for a better understanding of the relationship between the local population and their foreign rulers.

The Persian conquest of Armenia did not have such far-reaching effects on the material culture as in Azerbaijan and Georgia. Yet, a thorough analysis of the transition from Urartian (via Median) to Achaemenid rule still has to be done. So far, it seems that the local tradition of Armenia was much stronger than in the neighboring countries. This is true not only for the architecture but also for the applied arts.

The aftermath of Achaemenid rule in the Caucasus is unique insofar as at several sites in Georgia there is strong evidence for continuity rather than a harsh break (Knauss 2006: pp. 107–114, 2008: pp. 52–62, 2014: pp. 141, 144). Obviously local vassals of the Great King stuck to Achaemenid traditions even after the fall of the empire because they owed their regional position of power and their legitimation to the foreign rulers.

CHAPTER 23

The Empire's Northeast

Claude Rapin

Extending to the east of the Caspian Sea and beyond the Hindukush range, the northeastern part of the Achaemenid Empire belongs, from a cultural point of view, to the Iranian world from the second millennium BCE. Its area covers the present northeastern Iran, northern Afghanistan, and part of the five Central Asian republics issued from the USSR. From its conquest by Cyrus and Darius I during the last third of the sixth century BCE until the expedition of Alexander the Great which concluded the reign of Darius III, the territory from an administrative point of view was distributed between Hyrcania, Parthia, Aria, Margiana and Bactria, Sogdiana, Chorasmia, and the northeastern peripheral Saka/Scythian territories (Vogelsang 1992).

Socioeconomic Context

The region is shared between sedentary populations dwelling along a net of irrigated oases and agro-pastoral and nomadic populations aligned along the foothills or in the large steppic areas bounding the oases.

To the west, the Parthian and Margian territories stretched between the Kopet Dag and the Kara-kum desert encircling the Murghab delta, while to the northwest, on the delta of the Amu-darya between the desert and the Aral sea, Chorasmia constituted a deeply sedentarized peripheral extension of the empire (Kidd and Betts 2010). To the east, along the Oxus frontier (Wakhsh river and Amu-darya), Bactria and southern Sogdiana formed a densely inhabited

area (the “Bactro-Sogdian depression”) centered on Bactra. To the northeast, the natural resources of the Zeravshan enriched Samarkand, one of the largest cities of the empire. Beyond Sogdiana, between the Tamerlan’s Gates and the Syr-darya/Iaxartes frontier, the Scythian satrapies (Saka Tigraxauda and Haumavarga) acted from the Aral to the Pamirs as an intermediary over the trans-Asiatic steppic belt (the Massagetes cannot be clearly located, however).

The deserts and the mountain ranges did not constitute any barrier for international contact. Several passes across the Hindukush connected the Oxus basin with the Indian world through the crossroads of Kapisa/Begram (future Alexandria on the Caucasus). Among the passes that crossed the Hissar and Alai ranges to the north, the Sogdian Iron Gates near Derbent (Rapin 2018) were the easiest way between Bactra and Maracanda/Samarkand.

The data relating to the occupation of the territory and its economic and administrative organization rely mainly on surveys and excavations (Koshelenko 1985; Francfort 2005; Lo Muzio 2017). Particular attention has been devoted to the irrigation development from the Bronze Age in Afghanistan (see the French researches in northeastern Afghanistan) and in the Central Asian republics (Francfort and Lecomte 2002). Besides the agricultural and pastoral economy, the region was inserted in the international system of exchanges thanks to its precious mineral deposits (see, for instance, the decoration of the palace of Darius at Susa or the luxurious tableware made of stones of eastern origin). In fact, the local excavations have provided rare testimonies of luxurious productions since the jewelry used mainly gold (see *infra* the treasures of the Oxus, of Mir-Zakah 2, and of Takht-i Sangin). The Achaemenid commercial exchanges seem to have been rather limited. To the north, along the lower Syr-darya, in Kazakhstan and Russia, precious merchandises dating to the very end of the Achaemenid or the beginning of the Hellenistic period are concentrated in the aristocratic burials of the upper classes of the nomad population shattered from the Ural to Altai and Siberia (see Francfort 2005, 2013). Even at the end of the Achaemenid period, the scarcity of coin finds to the north of the Hindukush shows that, in contrast to the Indian world, these regions were less monetarized, a situation which lasted until the Hellenistic period.

Chronological Frame

The Central Asian components of the Achaemenid Empire appear as a heterogeneous synthesis of cultural, social, economic, and political trends. The unity of the region as a part of this empire is more difficult to identify since the real marks of the Persian civilization symbolized by Persepolitan features are scarcely distributed in the archeological material. However, the cohesion is real. Beyond its Iranian roots, the Central Asian area has mainly inherited its

cultural frame from a long process which can be stressed in three cultural steps: the first, formed during the Bronze Age, is represented by the so-called “Oxus Civilization” or “Bactriana-Margiana Archaeological Complex” (BMAC), which interacted during the second millennium BCE with the “steppic” Andronovo culture. Into the same geographical frame, this period was succeeded during the second half of the second millennium BCE by a first step of the Iron Age characterized by a process of renewal of the architecture, the funeral customs, and the material culture. This new “entity” is known, among others, under the general name of “Yaz I” culture, according to the chronological scale established on the base of the excavation of the homonymous site of Yaz-depe in Turkmenistan. This period is characterized by the distribution of a handmade pottery with a painted geometric decoration and some gray ware. Whilst the large palaces and sanctuaries proper to the Bronze Age are absent at the beginning of the Iron Age, several settlements are erected on platforms or natural terraces.

Before the arrival of the Achaemenids, the so-called “Yaz II” period (c. ninth to sixth centuries BCE) is marked by an increase in wheel-made pottery and the diffusion of real iron objects. This period is more than transitional, since it is documented with new fortified centers dominated by monumental architecture (Ulug-depe I, Koktepe II, and Sangir-tepe II, etc.; dating is not sure for El’ken-depe III, Talashkan I). While irrigation generally developed from the Bronze Age onward, it is not clear to what extent some centers such as in Zeravshan then related to the ancient irrigation programs identified through the surveys.

As for the preceding periods, the few historical facts relating to the Achaemenid rule (“Yaz III” period) do not coincide with a visible transformation dated by direct Achaemenid cultural features. The strength of the regional traditions is represented, for instance, by the continuation of wheel-made cylindro-conical pottery, while the shapes linked to proper Persia are limited to very scarce vessels (Lyonnet 1997). The integration in the Achaemenid Empire was realized mainly through the local nobility.

Besides the fact that it must extend to other regions inside and outside of the empire, the study of this period cannot ignore the influences the Achaemenid presence exercised in the later historical phases among its Parthian, Graeco-Bactrian, and Chorasmian successors, as well as during the still later Kushan and Sogdian periods.

Written Sources of the Achaemenid Period

The texts relating to the Central Asian provinces are rather scarce and fragmentary. The most ancient references in the Iranian context are given by the *Avesta*, according to which eastern Bactria was the cradle of the Zoroastrianism

(*infra*). For the Achaemenid period, most of the sources belong mainly to the corpus of propagandistic and administrative documents from the heart of the empire. The local perspective is represented only by a group of recently discovered administrative Bactrian parchments of the fourth century BCE (Naveh and Shaked 2012). Among the Greek sources, the reports relating to pre-Achaemenid Bactria by Ctesias and Xenophon are controversial, while Herodotus knew little more than the earlier geographer Hecataeus. Similarly, the historicity of the presence in Bactria and Sogdiana of Mediterranean communities like the Barceans cited by Herodotus (4.204), or the Branchidae by Curtius Rufus (7.5.28–35), cannot be confirmed by any archeological site. Besides rare non-dated “Persian” short inscriptions (Kandahar and Ai Khanum), most of the texts related to the Achaemenid presence belong to the later Aramaic tradition (inscriptions of Ashoka and later evidences from Bactria, Parthia, Margiana, and Chorasmia). The administration illustrated by the Graeco-Bactrian inscriptions of Ai Khanum and Graeco-Bactrian parchments recently discovered to the north of the Hindukush must be partly considered as the Hellenistic heir of the Achaemenid financial and fiscal system. The glyptics, however, is practically not represented (Francfort 2013).

From a literary point of view, the analysis of the Achaemenid past of the region relies mainly on the Graeco-Roman sources relating to Alexander and his successors (Briant 2020; Rapin 2018).

Cities and Archeological Settlements

The field studies are rather scarce for fixing the precise hierarchy, nature, and evolution of the archeological sites (Figure 23.1). Besides the capitals of the satrapies, the territory comprised several large cities, probably at the head of the hyparchies, as well as regional castles, not to mention the villages or isolated settlements.

The capitals mentioned by the classical texts have been only partly excavated: Gorgan (in Hyrcania; Zadracarta was Sari in Tapuria), Merv (Erk-kala, founded during the early Iron Age, later named Antiochia of Margiana, while Alexandria of Margiana was possibly more to the south in the region of Kushka), Herat (Artacoana/Alexandria in Aria), Begram (Kapisa in Paropamisadae), Balkh (Bactra in Bactria), Samarkand-Afrasiab (Maracanda or Zariaspa in Sogdiana), and Nur-tepe near Kurkat (Cyropolis or Cyreschata in Scythia-Ustrushana, between Zaamin/Alexandria Eskhate? and Khojent/Antiochia Scythica). The capital of Oxiana (near which Alexander probably founded his Alexandria Oxiane) was somewhere in the center of the Sherabad-darya district, not far from Sherabad, Talashkan-tepe, or Jandavlat-tepe (Rapin 2018).

Though their status is not precisely established, several large cities centered on the main oases, on crossroads and strategical positions, were probably the

Figure 23.1 Map of the eastern part of Central Asia at the moment of the fall of the Achaemenid Empire and route of Alexander the Great in 330–327 BCE according to the most recent researches.

heads of the Achaemenid hyparchies. Besides Bactra, the south of the Oxus was controlled by cities such as Altyn Dilyar, Cheshme-Shafa (*infra*), and Kohna Qala ("Ville ronde") near Ai Khanum (*Oskobara/Eucratidia) along the "Ochus" river/Darya-i Panj. Mentioned by the Bactrian parchments and the classical sources, Khulm/Tashkurgane (Khulmi), Qunduz (Varnu/Aornos), Drapsaka in the region of Surkh-kotal, and Hulbuk (Cholbisina) have still to be explored. In Sogdiana, two cities controlled the Kashka-darya valley: Kiš/Nautaca near Shahr-i Sabz (sites of Uzunkyr, Padayatak-tepe, and Sangir-tepe)

and Nikhšapaya/Xenippa near Karshi (site of Erkurgan). Other cities are represented by Koktepe (probably ancient Gava and Gabai, capital of Sogdiana until Cyrus), Kyzyl-tepe (Gazaba? in Paretacene), Bandykhan, etc. North-west of Termez (later Antiochia Tharmata), sites like Shor-tepe (Tarmantis?) near Kampyr-tepe (later Pandokheion) controlled the principal ford on the Oxus. The situation of Chorasmia differs since its Achaemenid sites developed later.

A Sogdian City from the Iron Age to the Hellenistic Period

The reconstitution of the political, social, and economic institutions relies on rare excavated sites (Figure 23.2). The study is mainly limited to military features represented by a citadel and large lines of fortifications (Afrasiab,

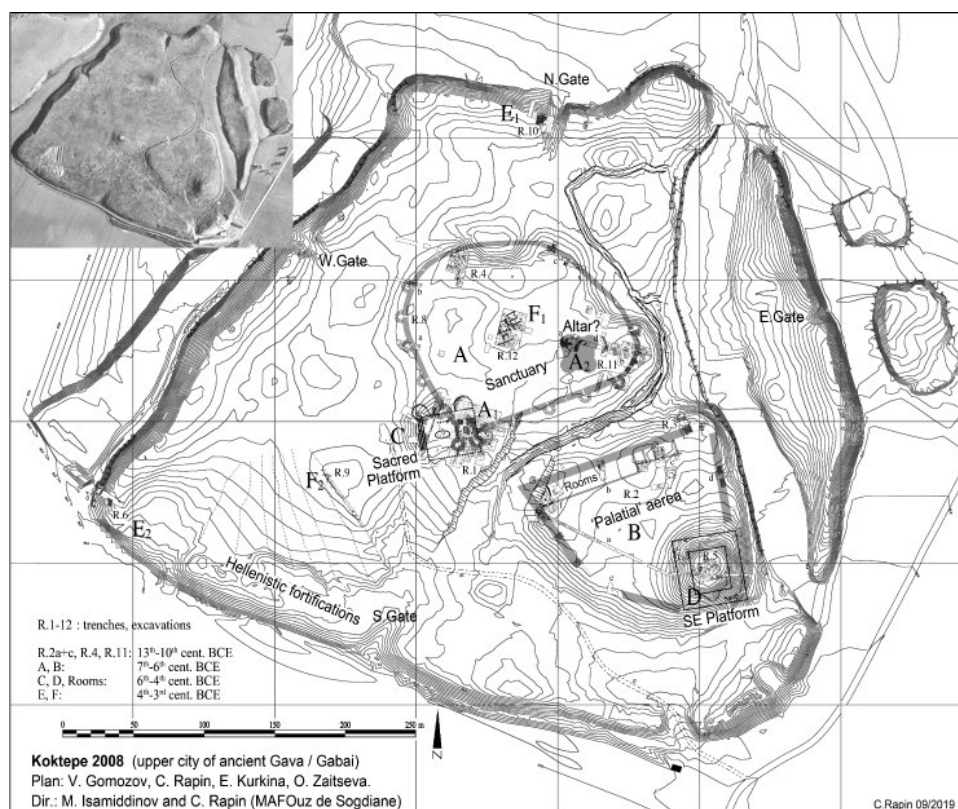

Figure 23.2 General plan of Koktepe/Gava (Sogdiana). *Koktepe II* (last pre-Achaemenid period): A and B) large monuments (A: sanctuary; A2: altar?). *Koktepe III* (Achaemenid period): C: central sacred platform; D: southeastern platform. *Koktepe IV* (early Hellenistic period); E: fortification; F: barracks.

Erkurgan, Uzunkyr, Koktepe, etc.), which not only englobed the proper monumental quarters but in times of danger had to shelter also the population of the region and the herds (these sites must be distinguished from the temporary fortresses or “rocks” occupied by the last Achaemenid Sogdian governors who opposed Alexander near the Iron Gates: Rapin 2018). The later Hellenistic cities like Ai Khanum reflected the same urban guidelines.

Mirroring the best explored Achaemenid cities to the south of the Oxus (Altyn 10 in Bactria with its close parallel of Dahan-i Ghulaman in Seistan), the site of Koktepe provides an example of long-term urban development of the northern areas, in both agricultural and nomadic contexts (Rapin and Isamiddinov 2013).

Since the artifacts do not usually provide easy benchmarks in absolute chronology, the analysis relies on the stratigraphy, mainly on the changes which affected monumental architecture of fortifications, palaces, and sanctuaries during the successive political transitions. Established on a natural plateau near the Bulungur canal to the north of Samarkand, the earliest urban settlement of Koktepe appeared in the Yaz I agricultural context. It is not clear whether the city was fortified like the similar sites of Chust and Dalverzin-tepe in Ferghana, but its regional importance was enhanced by the presence of apparently “official” monuments and a dense habitat. After it was abandoned, the site was devoted to pastoral activities for a couple of centuries.

Before the Achaemenids, Koktepe (Koktepe II period) appears as the major settlement of the Zeravshan, probably under the name of Gava, one of the cities mentioned in the early Avestan geography. Two large fortified courtyards appear on the plateau, one of religious function and the other, later complemented by a row of large rooms, grouping probably political, administrative, and economic functions. These buildings sheltered the primitive institutions of a “proto-urban” organization in the context of a regional power which probably emanated from the sedentarization of the Scythians and evolved into a first stage of the Sogdian state. A thick fortification several kilometers long around the plateau must probably be attributed to this period (rather than to the Achaemenids who later, probably under Darius I, fortified Afrasiab itself on a length of more than 5.5 km). It is not excluded that the other oases followed a parallel process, for instance in the Kashka-darya (ancient Kiš) and along the Kopet Dagħ (fortification program of El’ken-depe III, “Median” architecture of Ulug-depe I: Lecomte 2013).

From an archeological point of view, the transition toward the Achaemenids is rarely attested. Some sites are then abandoned (for example, Ulug-depe). At Koktepe the transition occurred apparently through a drastic change of architectural patterns marked by the erection of two platform buildings, the southeastern one having been built a little later than the central one (Koktepe III architectural phase). This renewal of the symbols of authority coincides

probably with the takeover of the region by Cyrus and Darius I. At the end of the Achaemenid period, however, Koktepe was no more than a regional fortress (known by the historian Arrian under the name of Gabae), while Afrasiab-Maracanda had reached the primacy between Zeravshan (the ancient Zariaspes/Polytimetus) and the Dargom canal (Dargomanes of Claudius Ptolemy).

The life of the main cities was partially interrupted during the first decades of the Macedonian power. Afrasiab and Koktepe are among the rare sites which present continuity as regards the location between the Achaemenid and Hellenistic periods, since several cities were rebuilt on adjacent sites during the Seleucid era.

Palaces

By its architecture, Koktepe represents one of the models of the proto-urban development of the Central Asian cities. In contrast to the domestic architecture, the large monuments can be dated more easily since their construction can be linked to the historical transitions during which new authorities – like either the central Achaemenid power or the local satraps and hyparchs – intended to settle their power by launching new architectural programs.

Although it is difficult to seize links with the West, the Achaemenids do not seem to have imposed a strong cultural unity. Some architectural features of the independent quadrangular buildings formed around open courtyards evidenced at Altyn 10 and Dahan-i Ghulaman seem to derive from traditions of the heart of empire (Persepolis, Pasargadae), but important monuments like the ones of Koktepe derive perhaps from a local or nomadic tradition. With the exception of some corridors, the satrapal palace on the citadel of Afrasiab (where Alexander murdered Clitus in 328 BCE) has not been explored enough for the identification of its main lines.

The origin of the schemes can be defined through the study of the much later Parthian royal complex of Old Nisa and Ai Khanum, two cities reflecting Greek, Bactrian, and Iranian (more than Mesopotamian) trends. While they are not systematically parallel to the general orientation of the sites, the buildings of both cities are structured by a network of corridors which allows us to distinguish private from public circulation areas, ensuring the movements around or between the units representing the various functions (residential, political, administrative, economic). Although they evoke a Mesopotamian tradition (see the Nebuchadnezzar palace of Babylon and the Darius palace at Susa), the corridors seem to have been already present in the local tradition from the beginning of the Achaemenid period. Other schemes like the quadrangular buildings organized around a courtyard (see above) originated in the

common – western and eastern – Iranian world. The structures comprising a central unit encircled by corridors and rows of rooms with an axial pronaos or a porch constitute a rather widespread scheme at Old Nisa and in Hellenistic and Kushan Bactria. In the western Iranian world some residences like the Ayadana of Susa are often unduly identified as temples for the confusing analogies with the “ateshgah” scheme of the much later Parthian and Sasanian periods.

In the northern periphery of the empire (Chorasmia and lower Syr-darya), the Achaemenid trends developed much later, from the fourth or third century BCE, under the form of large fortified settlements and cities (Koj-Krylgan-kala, Kalaly-gyr 1 and 2, Kjuzeli-gyr, Kazakl'i-yatkan/Akchakhan-kala, Babish-Mullah) (Minardi 2015).

The Platforms

The platforms supporting open or covered constructions cannot be grouped into a clear typology, especially as it is difficult to assess a possible western influence. Several examples reflect a clearly local origin since their foundation often goes back to the early Iron Age. The largest platforms – more than 15 ha – had the status of regional cities (Altyn-Dilyar-Tepe, plateau of Koktepe in Sogdiana), while the smaller ones corresponded to regional fortresses like Tillya-tepe in Bactria. The fortress of Kuchuk-tepe assumed possibly a religious function during the Achaemenid period (Francfort 2005).

Religious Life

Contrasting with the Bronze Age, at the end of the second millennium a fundamental change occurred in religious life with the abandonment of the burial practices by the sedentary societies. While the inhumation survived in the steppic societies (to the point that the study of their cultures relies almost entirely on their necropoles) and is represented by various mausoleums in the peripheral Chorasmia, the sedentary populations of Central Asia were devoted to new funerary rituals materialized by the absence of human remains, the corpses being exposed to open sky for emaciation. These changes coincide with the emergence of the Mazdaean and Zoroastrian religion during the early Iron Age.

Among the most ancient parts of the *Avesta*, the first chapter of the *Vendidad*, composed not long before the Achaemenids, refers to a geography whose scheme radiates in Central Asia across a territory which coincides with the area covered by the “Oxus” cultures of Yaz I and II. The center into which

this geography converges is not political but religious, since it corresponds to the place of the Illumination of Zoroaster, in northeastern Afghanistan (Grenet 2005). Therefore, at the arrival of the Achaemenids the Central Asian area is already inserted into the heart of a large common religious sphere.

The religious architecture is concentrated on a rather small corpus of sanctuaries and temples, whose identification and dating are often doubtful. One of the older performances of a fire cult has been evidenced at Koktepe/Gava in a pre-Achaemenid courtyard monument (period II), possibly in connection with an only partially excavated platform (Figure 23.2 A and P).

The Achaemenids did not impose a centralized religion, as the presence of varied types of monuments illustrates. According to Herodotus I, 131–132, and Strabo XV, 3, the most ancient rituals were practiced in the open air. This statement could correspond to sacred platforms whose tradition goes back to the Bronze Age (Nad-i Ali in Seistan) before a renewal at a more modest level during the Iron Age in the northeastern regions (Erk-kala in Margiana, and Koktepe, Sangir-tepe, Pachmak-tepe, and Pshak-tepe in Sogdiana). This architectural tradition lasted beyond the Achaemenids, as evidenced by the Hellenistic sacred platform and the stepped podiums on which stand the two main temples of Ai Khanum.

The existence of complex altars devoted to open-air rituals in courtyard sanctuaries like at Dahan-i Ghulaman is however not proved to the north of the Hindukush, although such a structure is not excluded for the unexcavated sanctuary of Cheshme-Shafa to the south of Bactra. In Chorasmia, the worship in the open air seems to have occurred in two circular sanctuaries (Kalalygyr 2 and Gjaur-kala 3). More to the east, it is not clear in what measure the Saka Haumavarga (in Ustrushana?) associated Zoroastrianism to their nomadic kurgan funeral practices.

It is usually considered that the covered temples (intended to house cult statues) appeared rather late in the Achaemenid period, perhaps even during the Seleucid period. Recent discoveries reveal, however, that in Central Asia both open-air and covered architectural types broadly coexisted already from the early decades of the Achaemenid rule. A covered temple at Sangir-tepe (period III, earlier phase) seems indeed to coexist with the sacred platform in Koktepe (period III: Figure 23.2C). The temple of Sangir-tepe was later replaced by a platform, whilst in the Surkhan-darya other covered temples were erected during the fourth century BCE (Kuchuk-tepe(?) and Kindyk-tepe near Bandykhan). It is not excluded that the Oxus treasure (*infra*) belonged to a similar temple.

The Graeco-Bactrian covered temples comprise a cella surrounded by sacristies and preceded by a porch or a pronaos. Since it appears rather late in Persia (see the Seleucid Frataraka temple at Persepolis), this scheme could derive from local early Achaemenid buildings (see Sangir-tepe in Sogdiana). It

is therefore not clear whether the ancient Mesopotamian area (see the sanctuary of Anu-Antum of the Bit-resh at Uruk) played a role in its development. A significant difference must be noted between the Mesopotamian and the Iranian worlds, since in the first case the lateral sacristies open on the pronaos (Bard-e Neshandeh and Masjid-e Solaiman), while in Central Asia they communicated directly with the cella. In this context, it means that the sacred treasure belonged somehow exclusively to the divinity.

While during the first centuries they were aniconic and addressed to the natural elements like fire and water, the Central Asian Zoroastrian cults progressed into an iconic polytheism which later differed from the proper Parthian and Sasanian aniconic cults of fire.

The scarce traces left by the earlier rituals are usually compatible with Zoroastrian features. Some of them correspond to rituals performed during the foundation of the sanctuaries (Koktepe and Sangir-tepe), while others evidence a worship centered on the natural elements (Sangir-tepe and Kindyk-tepe). The oldest iconic representations are known through the treasures of Mir-Zakah 2, of the Oxus, and of Takht-i Sangin. These treasures include Achaemenid, Hellenistic, and nomadic pieces of art such as statuettes, vases, bracelets, necklaces, rings, gems, votive plaques depicting Zoroastrian priests, donors, and animals dedicated to a temple and coins. The original context or dating of the Oxus treasure are the source of conflicting interpretations, but it can be considered that these objects were part of votive deposits sheltered in a monument which was replaced by the temple of Takht-i Sangin during the Graeco-Bactrian period.

Under the Graeco-Bactrian rule the Central Asian cults present a polytheist form whose divinities are iconographically Hellenized (Takht-i Sangin, Ai Khanum), while the sanctuaries are closely connected to the Achaemenid period through the artifacts of their sacred treasures. The Oxus river divinity was worshiped in Takht-i Sangin before the transformation of part of the temple in a "fire-temple" of Parthian-Sasanian tradition. The main divinity worshiped in Ai Khanum, in the temple with indented niches, at a distance of 100km from the Oxus, seems to have been rather a Zeus-Mithra or Zeus-Belos (hypothesis of Frantz Grenet). The common ground is enhanced by the discovery at Ai Khanum and Takht-i Sangin of two identical plaques illustrating Cybele associated to a ritual on a stepped altar raised on rocky ground which evokes also the traditional rituals on stepped platforms.

In conclusion, it appears that the intrusion of the Achaemenid power had no fundamental effects on Central Asian cultural life. Part of the transformations observed during this period results from a local evolution which began during the formative period of the Iron Age and continued long after the collapse of the empire. In this general context, marked by a slow evolution of cultural traditions, the appearance of innovative elements in pottery does not

immediately follow political changes. The objects related to the royal administration and to the aulic Persian art are limited to the treasuries, but the main impact of the real power of the Achaemenians can be identified through the best dated examples of monumental architecture, that is the palaces and sanctuaries.

CHAPTER 24

The Empire's Southeast

Rémy Boucharlat

Today, the southeast of the empire covers the entire southeast of Iran (the provinces Kerman, Sistan-Baluchistan, and Hormuzgan), the south of Afghanistan (the provinces of Kandahar and Nimruz), the western part of Pakistan until the river Indus (Baluchistan and Sind, and its northern region, ancient Gandhāra), and, very likely, part of the Arab shore of the Persian Gulf and the Arabian Sea (the United Arab Emirates, the Sultanate of Oman).

In the Achaemenid period these are the satrapies from west to east: Carmania, Drangiana, and south of the latter Makā, moreover Arachosia, India, Sattagydia, and to the north Gandhāra. But not even the borders between Fars and neighboring Carmania (Kerman) have been ascertained, due to the scarcity of information we have on the historical geography of this part of the empire. To define specific cultural horizons of each region is difficult due to the dearth of known archeological sites (Vogelsang 1992).

When looking for settlements of the Achaemenid period, the archeological research has to concentrate along ancient roads, known from Alexander's itinerary as reported by Classical authors, and in the rich valleys. Among the natural resources of that region, the Achaemenid royal inscriptions in Susa mention *yakā* wood from Gandhāra and ivory from India. A special green stone, chert, from Arachosia, was used for making series of mortars and pestles found in the Persepolis Treasury (Bowman 1970). The corresponding quarries have not been located yet.

Initial archeological exploration is sporadic; it begins seriously with the reconnaissances of intrepid Sir Aurel Stein in Gedrosia in 1927, then, in 1932,

in Kerman down to Bandar Abbas (Stein 1931, 1937). Although he is mainly interested in prehistoric periods, he is careful to take down the late prehistoric sites that lie on his way (first millennium BCE) as well as later ones. From the great British explorations in the Indus valley and Gandhāra, information with regard to settlement in the Achaemenid epoch is sporadic. As a result, our information on the Achaemenid southeast derives from the exploration of just a few sites, barely one per region, in northern Pakistan (Akra, Charsadda, Taxila), Afghanistan (Kandahar), and Iran (Dahaneh-i Ghulaman, Tepe Yahya, Bam, Qaleh Kutчек). This meager state of knowledge and difficulties in interpreting the results of the surveys have so far prevented a precise periodization. A map of the population and of human activities in those regions remains to be designed.

Deviant from most Near Eastern regions which were populated – almost without interruption – from the Bronze Age to the Achaemenid period, the eastern half of Iran and the south of Afghanistan seem to have been unoccupied in the second millennium BCE until the beginning of the first millennium (Azarnoush and Helwing 2005: Map 4); this gap is real, but it is also a reflection of the paucity of research. The situation is not much different in the southern Indus valley, where this period has been described as a “Dark Age” (Franke-Vogt 2001). The resettlement is no by-product of the Achaemenid Empire; actually, it begins before, starting in the first half of the first millennium BCE in Iron Age II or III.¹ According to a hypothesis which gains more and more approval, this fresh start was set in motion by a new irrigation technique using subterranean galleries, instead of capturing episodic run-off and tapping springs in use since millennia. This dramatic change of technique, a response to the increasing desiccation of the climate, is well attested on the Arab shore of the Persian Gulf at about the same time, and certainly before the Achaemenid epoch (Potts 1990: pp. 391–392, 2004: pp. 78–79; Magee 2005; Wilkinson et al. 2012: pp. 167–169). A gallery like this did not lie very deep, thereby in my opinion differing from the famous *qanāt*, which taps a deep-lying aquifer, probably a later technique (Boucharlat 2001, 2017).

To the east of the imperial centers in Fars, three sites dated to the Achaemenid epoch are at present known in Carmania. At Qaleh Kutчек in the Halil valley, 18 km southwest of Jiroft, resettlement starts in the Iron Age and expands in the Achaemenid epoch, when it shows an urban organization with a citadel of more than 2 ha in its center, surrounded by an Inner and an Outer Town (Azadi et al. 2012). The site has been surveyed but not excavated yet. Southwest of Qaleh Kutчек, the high hill of Tepe Yahya, abandoned sometime in the second millennium BCE, was occupied again in the Iron Age (Level III, 800–600 BCE). A mudbrick platform that was rebuilt once follows. Its dimensions have not been ascertained as they surpass the limits of the sounding. Radiocarbon datings put both platforms between 650 and 500

BCE, that is, before and at the beginning of the Achaemenid epoch. They are seen as the work of a local authority which, according to the excavators, disappeared when Darius consolidated his power (Lamberg-Karlovsky and Magee 1999). Contemporary and later structures of Level II dated from 500 to 250 BCE consist of modest multiroom mudbrick and stone buildings (Magee 2004: pp. 73–75). Further to the east, around Bam, following upon the terrible earthquake in 2003, an intensive exploration of the region under reconstruction by Iranian archeologists brought to light several pre-Islamic settlements; an Achaemenid fort of about 400 m² and habitations have been identified. Here, too, the use of subterranean galleries, some of which seem to belong to that period, may explain the reoccupation of the region after a long hiatus (Adle 2006: pp. 43–47).

Along the Arabian Sea, east of the Strait of Hormuz, in the inhospitable region of coastal Baluchistan, the first millennium BCE sites consist often of large fields of cairn-burials, which were certainly used in the Parthian epoch, as is attested by the coins, but perhaps also earlier (Stein 1937). Not a single town of that period has been located (Franke-Vogt 2001: p. 270). This coast poses the problem of Makā, which has long been associated with the modern name of Makran. Today the satrapy named Makā is thought to have extended mainly to the other side of the sea into the Oman Peninsula (Potts 1990: pp. 393–400). There is, admittedly, no indication, for instance in the shape of Achaemenid-inspired objects and pottery, that the region belonged to the empire, but interestingly some pottery classes from the region are paralleled with Tepe Yahya (Magee 2004), one more argument for continuation of the traditional cultural relationships between the two sides of the Gulf also in that epoch.

The only candidate for the capital of Drangiana, Zarin according to Ctesias, is Dahaneh-i Ghulaman, near Lake Hamun at the border of Afghanistan and Pakistan. This exceptional Achaemenid site was founded and occupied at that period, but soon abandoned, probably due to the change of the Hilmand river bed. Of about 30 buildings discovered in the 1960s (Scerrato 1966; Genito 2012) and a dozen more in the past decade, five are large square structures with an ample central court. In QN16, measuring 53 m each side, the courtyard is surrounded by a corridor divided into a series of long rooms on the four sides. QN15 with a series of parallel narrow rooms on the sides is very close to the “Winter Palace” of Altyn 10 in far distant Bactria, dating from the Achaemenid period but deriving from a Bronze Age tradition (Sarianidi 1977: figs. 46 and 48). Besides the ovens and platforms found in several rooms, this building contained remains of wall paintings depicting a camel, horses, and an archer driving a chariot (Sajjadi 2007). QN2 with the courtyard divided into two parts by a series of long rooms can be compared to the square “Summer Palace” of Altyn 10 (Sarianidi 1977: fig. 45). This architecture is clearly linked

to Central Asian traditions, which are very different from the royal architecture in Achaemenid Fars. The most famous of those buildings, QN3, 53.20×54.30 m, consists of four porticoes with two rows of six mudbrick pillars, between four blocks in the corners. Due to numerous fireplaces in the porticoes and to its large courtyard with three rectangular platforms in the middle, the edifice has often been interpreted as a cultic monument, but there is no agreement as to the religion it served: whether Zoroastrian or pre-Zoroastrian (Gnoli 1993). The functions of the buildings mentioned are still to be understood. All those buildings, as well as clusters of multiroom houses between them, are built on either side of an artificial main canal and along a secondary branch. Apart from this main part of the site, there is another building with a completely different plan: in the middle of an enclosure of 190 m², the building measuring 50×55 m consists of a rectangular central space (courtyard or large room?) flanked by four corner rooms; the general layout recalls the type of the Pasargadae palaces (Mohammadkhani 2012).

Dahaneh-i Ghulaman is completely built of mudbricks of 33 cm side length, as known from Persepolis and Susa, or 50×50 cm; baked bricks appear rarely, stone is totally missing. The multiyear excavations and recent surveys have provided a valuable corpus of pottery which is a reference (Genito 1990). The time-limited activity at this major but isolated site and the lack of regional settlements around it which have sustained the city (according to recent careful surveys) remain a challenge for understanding the functioning of this satrapical center set in a harsh environment.

In Old Kandahar, the capital of Arachosia, the British excavations of 1974–1978 were interrupted by the wars in Afghanistan but carefully published (McNicol and Ball 1996; Helms 1997; summary Ball 2019: s.v. Kandahar). On this huge site, two of the soundings 600 m afar show that the rampart (“casemate curtain”) with a moat protected a vast surface in the Achaemenid period. Other trenches at different places inside the site brought to light thick *pakhsa* (pisé) walls and a platform belonging to a citadel testifying the extension of the Achaemenid occupation. The foundation of the city of Kandahar and its fortification are clearly dated to the Achaemenid period but follow earlier occupation periods. The discovery of fragments of two Elamite-Persepolitan-type tablets inside the fortification confirms the integration of the region into the empire (Fisher and Stolper 2015). The study of the pottery, which includes carinated bowls, has made it possible to assign to that same epoch some other sites in Pakistan (Franke-Vogt 2001; Magee and Petrie 2010).²

In the regions on the western shore of the southern Indus valley, excavations or surveys have been more intense than in the arid regions of the southeast; occupation in the first millennium BCE is well attested, including the Achaemenid epoch, but while cultural changes toward 600–500 BCE can be shown up, it is difficult to distinguish the Achaemenid period from following

periods because of the continued presence of the shapes of the hallmark artifacts of this vast region, such as the S-carinated bowls and the deeper “tulip bowls” appearing c. 400 BCE here as well as in several Iranian regions, from where they originate (Franke-Vogt 2001: pp. 258–260). That difficulty is also apparent by their presence further north, in Gandhāra, on Taxila and Charsadda (Marshall 1951; Wheeler 1962), major sites of the Hellenistic period and the centuries following. On these sites the Achaemenid occupation is still under discussion, but an Achaemenid settlement on the Bhir Mound of Charsadda is very likely (Magee and Petrie 2010: pp. 514–515), and it is not the first on that site. At both sites, tulip bowls probably date from the late Achaemenid or post-Achaemenid period. The same can be said of the so-called Graeco-Persian seals; very few came from excavations (Bhir Mound). They might have been locally produced (Callieri 1997: pp. 235–237). The first evidence of coinage with (silver) bent bar “coins” at Charsadda is generally attributed to the very late fourth century BCE (Marshall 1951: Pl. 234). To the southwest the excavations at Akra in the Bannu Basin in 1995–2000 brought to light evidence of an Iron Age settlement extending over more than 30 ha. On Area B, a series of soundings evidences an Achaemenid occupation with pottery, including the distinctive tulip bowls, which can be compared to sixth to fourth century BCE assemblages from Iran and Afghanistan. Because of the size of the site and on the ground of epigraphic and historical data, the excavators suggest Akra was the capital of Thatagush (Magee et al. 2005; Magee and Petrie 2010).

NOTES

- 1 Dahaneh-i Ghulaman in Sistan is a remarkable exception. See below.
- 2 On the other hand, Iron Age III installations, such as Pirak Level III in Pakistani Baluchistan and Nad-i Ali, in southwestern Afghanistan (near Dahaneh-i Ghulaman), are supposedly abandoned in the Achaemenid epoch (Franke-Vogt 2001).

**PREDECESSORS
OF THE PERSIAN
EMPIRE AND ITS RISE**

CHAPTER 25

The Median Dilemma

Robert Rollinger

It is no easy feat to correctly ascertain the role of the Medes in the historical and political development of the Ancient Near East. This is mostly due to two distinct problems, the first being a disparate and heterogeneous source tradition. Just as importantly, however, scholarly “tradition” has led to the calcification and entrenchment of certain ideas and preferences, as regards, for example, which source genres to use in trying to write Median history. At times, the salient issues are thus not grasped in their entirety or are ignored in favor of a narrative reconstruction of historical events allegedly based on a solid foundation in the sources. As recently as the late twentieth century, it was accepted historical knowledge that the fall of the Assyrian Empire was followed by the rise of a Median “empire” which ruled vast tracts of the Ancient Near East for half a century, until Astyages, the last Median ruler, was overthrown by one of his own vassals, namely Cyrus the Great. Only relatively late, the important works of the late Heleen Sancisi-Weerdenburg pointed out the many difficulties and inadequacies of this view (Sancisi-Weerdenburg 1988, 1995; see also Kienast 1999). Sancisi-Weerdenburg was particularly critical of the alleged “imperial” structure and character of Median rule and identified a number of striking dissimilarities with other imperial entities of the Ancient Near East. She also emphasized the almost complete dependency of modern historiography on Classical (i.e. Greek) sources, to the nearly complete disregard of Ancient Near Eastern sources. Unfortunately, Sancisi-Weerdenburg’s work was met with very little acceptance. On the contrary, her hypotheses and

conclusions were ignored, and the problematic nature of previous scholarship was marginalized.

An international symposium held in Padua in 2001 attempted to rigorously review all available sources and to present a secure (as far as possible) narrative of Median history (Lanfranchi et al. 2003). While the participants were largely successful in their first aim, no consensus on an accepted narrative could be reached due to the frustratingly incomplete and fragmentary nature of the sources. There was, however, a general consensus that the existence of a Median “empire” cannot be conclusively proven and should not be treated differently from other hypotheses. Opinions were divided on any further detailed characterization of historical events: whereas many of those present rigorously refused it or attempted to follow through on the theses of Sancisi-Weerdenburg by questioning the geographic extent of Median influence (Liverani 2003; Rollinger 2003a, b; Henkelman 2003; Jursa 2003), others still chose to accept the notion of a Median “empire” (Roaf 2003). The discussion has continued up to the present (Tuplin 2005; Lanfranchi 2021; Rollinger 2004, 2005, 2009, 2010, 2011, 2020a; Waters 2005). What follows is an attempt to tackle this “Median dilemma”¹ and to throw a more general light on the Medes and their “history,” the available sources, the problems, and what we can state with some certainty.

In the reign of the Neo-Assyrian king Shalmaneser III (858–834 BCE), Medes (Madāya) are mentioned for the first time. In the following centuries, they appear again and again in Neo-Assyrian sources, especially in royal inscriptions, but also in archival records, mainly as opponents encountered when the Assyrian armies campaign in the central Zagros area – where they are primarily localized – but also as vassals of the Neo-Assyrian super power (Radner 2003; Bagg 2020, pp. 379–382). Although it is unclear how far to the east the Assyrians reckoned with the presence of a Median population, there is evidence that it was as far as the region of the modern cities of Teheran and Rey (Rollinger 2007).

Not only for the Neo-Assyrian era of the ninth through seventh centuries BCE but also for the following Neo-Babylonian and early Persian times (sixth century BCE) our sources exclusively exhibit an external view of the Medes (Liverani 2003). There is not a single indigenous source representing a “Median” perspective on their matters, their history, or their agenda. Nor do we know whether there was a shared Median identity and whether the Medes of our sources called themselves Medes (Lanfranchi 2003: p. 84). Sometimes the Neo-Assyrian sources refer to “mighty Medes” and “distant Medes.” At least these qualifications look very much like projections from outside in order to organize the expanding knowledge of an area becoming increasingly well known by the Assyrians. Some of these “Medes” were localized inside the empire, some of them outside; this makes them, as seen through an Assyrian lens, a border population. The Medes within Assyrian reach were regarded as

vassals and had to swear the loyalty oath to the Assyrian heir apparent Esarhaddon (672 BCE).

The origin of the term *Madāya* is unknown, its specific trans-regional usage evidently derives from Assyrian practice. Like in antiquity the ethnic term “German,” picked up from a very local and indigenous usage and artificially spread over the entire population east of the Rhine river by Caesar himself, the Assyrians might have taken up a local designation somewhere in the central Zagros area and transferred it to a far larger population covering the whole of the central Zagros and farther to the east.

Although the most popular one, the designation *Madāya*/Medes was not the only one used for the population of the central Zagros area. In the second half of the eighth century BCE appears the designation “Arabs of the east” (Radner 2003: p. 55). We do not exactly know what this actually means but it seems to reveal some kind of uncertainty about how to label the peoples of the central Zagros regions. “Arab,” a term that also appears for the first time in world history in the inscriptions of Shalmaneser III, may, at least initially, represent not an ethnically or linguistically determined designation but one referring to a specific mode of living, where transhumance or trade with camels might have played a major role (Lanfranchi 2003).

In Neo-Babylonian and (retrospective) Persian sources the term *Ummān-manda* appears for the Medes (Adali 2011). The term clearly is a designation deriving from outside and has a pejorative connotation. Moreover, it is evident that the term *Madāya* and the Neo-Assyrian concept attached to it – i.e. a rather homogeneous and substantial population of the central Zagros area – became part of a tradition and was adapted by contemporary and later, adjacent and more distant languages and cultures, like the Urartians, Babylonians, Hebrews, Greeks, and Romans.

As we do not know whether these *Madāya* had a supra-regional Median identity, we are also ignorant about whether they represent a homogenous linguistic group. Although the many “Median” proper names that we have, thanks to the flourishing cuneiform and later especially Greek sources, reveal a dominant Iranian background of these people, one should be cautious about claiming that this evidence definitely proves a homogenous and well-defined Iranian language, generally and simplistically labeled “Median.” Such a hypothesis, although very common and likewise broadly accepted as fact, does not rest on firm ground (Schmitt 2003; Rossi 2010, 2017). It is highly probable that behind these proper names lurks a much larger and more complex diversity of local Iranian dialects/languages. And certainly, we have to reckon with a larger ethnic diversity in general in these areas where Urartian, Hurrian, Elamite, Assyrian, Babylonian, and other languages played a certain role (Fuchs 2011).

Over the 200 years of rather extensive Neo-Assyrian documentation there is not a single piece of evidence for a unified political entity in the central Zagros

region, let alone for a Median “empire.” Instead, these sources depict a highly fragmented political landscape in the Zagros mountain region, with no discernible tendencies toward greater centralization. The Assyrians encounter a plurality of small political units, whose rulers they call not “king” but “city lord” (*bēl āli*). Although transhumance was highly important in these regions, horse breeding and trade/robbery also played an important role, since the Khorasan road, i.e. the predecessor of the Silk Road, crossed the central Zagros area. In any case, the Assyrian sources never describe the Medes as nomads but always as a sedentary population. Intensive contact with the Assyrian super power and its gigantic economic space was highly influential in these regions, especially when with the reign of king Sargon (721–705 BCE) the Assyrians began to establish provinces. These contacts certainly transformed local societies and may also have triggered developments toward political unification that can be described as “secondary state formation” (Brown 1986; Rollinger 2020b), although this process never became a supra-regional phenomenon. This conclusion is confirmed by archeological sources that, likewise, do not indicate the existence of a unified Median state. Important sites like Nush-e Jan, Godin Tepe, Baba Jan Tepe, or Ozbaki Tepe do not represent “imperial centers” but rather **seats of “city lords” with no more than a local reach** (Liverani 2003; Stronach 2003; Gopnik 2011). Previously identified seats of power of an alleged Median “empire” in western Iran, like Hamadan, or outside the proper central Zagros area, like Kerkenes Dağı in Asia Minor, do not hold up to critical scrutiny and have been revealed as optimistic academic mirages, constructed to fit preconceived notions of imperial Media (Boucharlat 1998; Sarraf 2003; Rollinger 2003b).

By about the middle of the seventh century BCE Assyrian sources on the Medes become scanty. They reappear on the political stage when the Assyrian Empire fights a final struggle for existence in the last third of the seventh century BCE. Our main source for these events is a Babylonian chronicle, the so-called “Fall of Nineveh Chronicle” (Grayson 2000: pp. 90–96). Although the Chronicle reveals a Babylonian perspective on the events, it does not deny that it was not only the Babylonian forces under their usurper king Nabopolassar (626–605 BCE) that brought the Assyrian super power to an end but a coalition of Medes and Babylonians, who even concluded a formal treaty of alliance (Rollinger 2003a, 2010; Fuchs 2014). The Medes are described as Ummān-manda and led by a certain Umakištar (Cyaxares in Greek). Obviously they “descend” to Assyria but the origin and reach of Umakištar’s reign remain obscure. They destroy the city of Assur in 614 BCE and, together with the Babylonians, Nineveh in 612. With this event Umakištar disappears again from the historical scene, although some Medes may have participated in the Neo-Babylonian campaign to the last Neo-Assyrian residence Harran to deliver the failing Assyrians their final blow (Rollinger 2003a).

The Medes prominently reappear in the inscriptions of the last Neo-Babylonian king, Nabonidus (556–539 BCE) (Rollinger 2003a, 2010, 2020a). Three events focus on the Medes through a Babylonian lens. The first one is once more the city of Harran in Syria. Nabonidus claims that the Babylonians were unable to rebuild the temple Ehulhul of the moon god Šin, allegedly destroyed by Medes during the final struggles of the Neo-Assyrian Empire in 609 BCE, because the Medes were supposedly still “roaming around” for more than 50 years. This is clearly an ideologically biased view where an allegedly permanent Median presence in Syria during the first half of the sixth century BCE is made accountable for Babylonian inactivity to rebuild the temple. In the same way, the Medes are presented as archetypical temple destroyers, an uncoordinated and destructive mass of people, and thus as true barbarians. This also goes for the second event, when Nabonidus looks back on the fall of the Neo-Assyrian Empire and describes the Medes as a destructive flood that ruined not only Assyria but also Mesopotamian cultic rites and cult centers. The third event is contemporaneous to Nabonidus, when he focuses on the end of Median dominance in the central Zagros area. In this context another Median leader is introduced 60 years after Umakištar. His name is Ištumegu (Astyages in Greek). The event in question is also addressed by the so-called Nabonidus Chronicle originating in Persian times, although inscription and chronicle are not in accordance concerning the dating of the event (553 vs. 550 BCE). Ištumegu seems to have ruled a political entity of medium size around its center, Hagmatana (Agbatana or Ekbatana in Greek; Hamadan in modern times), which controlled a territory no larger than the central Zagros region. He is not presented as a relative of the former Umakištar, and his political and especially military instruments appear to have been much less developed than those of his predecessor. He is in control neither of northwestern nor of southwestern Iran. He is not characterized as suzerain and superior of the king of Anshan, i.e. later Cyrus the Great. Rather, it was the latter who took the initiative and campaigned against his northern neighbor and rival, whom he quickly overthrew, and plundered Hagmatana (Rollinger 1999, 2010, 2020).

With this event the Medes do not disappear from cuneiform sources. Media has a coda in Darius’ Bisitun inscription (Rollinger 2005). It figures as a kind of supra-regional entity reaching from eastern Anatolia to central western Iran and farther to the east, and as far as the southern Caspian Sea. At first glance, one may take this as evidence for the extension of a former Median “empire.” But a closer look reveals that this is still a politically fragmentary and heterogeneous area, where several individual uprisings with different usurpers took place, only one claiming to be a descendant of the already legendary Umakištar. This evidence is thus best explained as a reflection of the reach of a very short-termed confederation that owes its brief existence mainly to the special historical circumstances around the fall of the Neo-Assyrian Empire.

The persistence of local traditions in a politically still fragmented landscape in these areas during early Persian times is also demonstrated by a much-disputed passage of the so-called Nabonidus Chronicle (ii 16) (Rollinger 2009; Rollinger/Kellner 2019). The passage deals with a campaign of Cyrus the Great in 547 BCE (the ninth year of king Nabonidus) toward a land which cannot be defined with absolute certainty because the text is partly broken. Only traces of the country's first sign are preserved rather badly, and it has been argued for about 100 years how to read this sign (Rollinger 1993: pp. 188–197). The discussion is characterized by the fact that such readings/interpretations have nearly always been presented as a “fact,” the tablet's bad state of preservation and the many different readings put forward notwithstanding. From the very beginning there was a mainstream opinion that the first sign of the country has to be read as Lu-[xxx] and the country thus to be interpreted as Luddu, i.e. Lydia. This is the main reason for dating Cyrus' conquest of Lydia in 547 BCE. Divergent opinions concerning the reading of the sign have always been pushed aside, and this is also true in current discussions. In this context, astonishingly, it has been totally ignored that this discussion should not be based solely on the reading of the sign in question. Obviously the many differing opinions expressed on this problem in the last 100 years more than clearly demonstrate that the tablet's state of preservation is simply not sufficient to claim that the problem can be definitely solved by presenting this or that solution (cf. van der Spek 2014: pp. 256, n. 184; more cautiously: Payne and Wintjes 2016: p. 14 with n. 6). Rather, one has to contextualize the problem and look at the whole passage in question. There it is stated that

King Cyrus (II) of Parsu mustered his army and crossed the Tigris downstream from Arbēla (Erbil) and, in the month of Iyyar, [march]ed to X [???]. / He defeated its king (or: put its king to death), seized its possessions, [and] set up his own garrison [there]. After that, the king and his garrison resided there (Nabonidus Chronicle ii 15–18; Grayson 2000: p. 107).

The document's geographical perspective reveals an important dimension of argumentation, although this crucial point is generally nearly totally ignored, for the alleged statement that Cyrus crossed the Tigris and marched toward Lydia is very difficult to explain. According to Google Maps, the distance between Erbil and Sardis is 1739 km, calculating the shortest route through upper Mesopotamia crossing the Euphrates at Birecik and continuing via Gaziantep to the west. But, Cyrus could not have taken this short route, for most of the area was, at least at that time, controlled by the Babylonians (Jursa 2003; Rollinger 2003a). If the reading Lu-[???] is supposed to be correct, he must have taken a route via eastern Anatolia that was about 2000 km in length. This is slightly less than the distance between

Cologne and Moscow (about 2300 km). From this perspective, such an interpretation becomes hardly tenable. It is as if a nineteenth-century central European chronicle on Napoleon's campaign against the Tsar had described the event as follows: "The French emperor crossed the river Rhine below Cologne and marched against Moscow."² Lydia is therefore not really an option, whereas the reading Ú-[??] is still a very attractive one. But even if this reading cannot be proven definitively, it is clear that Cyrus marched against a still independent country in the immediate reach of a route along the Tigris, and a region in eastern Anatolia is a very good candidate. Thus the chronicle becomes an important testimony also for Median history, for it proves that Cyrus' conquest of Ekbatana did not mean that he was also in control of eastern Anatolia. Apparently, there still existed an important political entity in this area that was only conquered by Cyrus in 547 BCE. There is further indirect evidence for this.

We know that Darius I and Xerxes set up inscriptions not only in their favorite residences, like Persepolis and Susa, but also in residences of those former political entities that were conquered by Cyrus and in which the early Achaemenids presented themselves as true and legitimate successors of their Teispid predecessors (Rollinger 2015: pp. 118–120). This is true for Hamadan and Babylon, for example, but also for Van. The inscription placed at a steep rocky flank of the former Urartian capital was obviously tremendously important, for Xerxes explicitly mentions that his father Darius already intended its construction, but only he was able to achieve this. The inscription only makes sense, however, if the choice of the location commemorates the former capital of a substantial political entity that ended through Teispid conquest. Together with the evidence from the Nabonidus Chronicle, this means that in the first half of the sixth century BCE the Medes cannot have been in permanent control of eastern Anatolia. Their power was mainly limited to the central Zagros area.

This now brings the Classical sources into play, for there is, for example, Herodotus' testimony that during an eclipse generally dated to 585 BCE, the Medes and the Lydians met at the river Halys in central Anatolia to forge an alliance. Although many historians still treat Herodotus as sourcebook, simply used like a quarry to rephrase history, it is increasingly clear that he has to be dealt with as a literary work completed during the Peloponnesian War, presenting a view on the past, first and foremost, through a Greek lens of around 420 BCE. In his *Histories* he skillfully elaborates ancient Near Eastern history as a sequence of empires, where empire is modeled according to the Persian-Achaemenid empire of Herodotus' own time (Bichler 2000; Rollinger 2003c, 2014; Rollinger et al. 2011). This is also the guiding principle of Ctesias' work, which survived only in fragments, developing Herodotus' concept of a Median "empire" even further (Wiesehöfer et al. 2011; Waters 2017). It is Herodotus, and especially Ctesias, who formed the basis for later Classical

sources that structured world history as a sequence of empires – a view that was adopted by late antique Christianity and passed on through the Middle Ages to modern times (Wiesehöfer 2003, 2005). It is mainly this reception history that saved for the Medes a prominent place in a Western view of world history canonized over a lengthy period. Both Herodotus and Ctesias describe Median history as a succession of kings ruling a united and far-reaching territory from the beginning to the very end (Rollinger 2010, 2011, 2020a). Apart from the name of the last king, Astyages, however, they completely disagree about the number of these kings, their names, and the duration of the Median period. With indigenous ancient Near Eastern sources they share only two facts: it was the Medes who brought the Assyrian Empire to an end, and it was Cyrus who overcame Astyages. It was apparently the fall of the Assyrian Empire that directed historical attention toward the Medes, yet without much further information on what these Medes really were. Herodotus, moreover, reports a famous story about how the Medes established monarchy. But this story has been decoded as a mix of Iranian mythology and sophistic Greek theories of the end of the fifth century BCE on how states come into being (Panaino 2003; Meier et al. 2004; see also Gufler 2016, and Degen/Rollinger 2020). Whereas Ctesias' Medes control the entire Ancient Near East, those of Herodotus do not. Their reach extends as far west as the river Halys (Kızılırmak) where they allegedly share a border with the Lydians. This border looks very much like a Greek construction of the fifth century BCE to organize ancient Near Eastern history, however (Rollinger 2003a). And to prove such a construction it is connected with a legendary story. This is exactly the “historical” context for localizing the Median-Lydian treaty at the Halys river and for the famous story about the sage Thales, who predicted an eclipse of the sun that brought Median-Lydian strife to an end. The Medes might have been roaming through Anatolia for a very brief period of time, and they may indeed have concluded a treaty with the Lydians, but there was no permanent Median control of eastern – let alone central – Anatolia in the sixth century BCE.³

Finally, some additional evidence demonstrates that the claim for a Median “empire” lacks a solid basis.⁴ There are no archeological remains of imperial centers, nor are there documentary archives surviving from a supposed Median administration. Not a single document has come down to us from their supposed domain, since multiple documents previously thought to have done so have been shown to be untrustworthy. There is also no contemporary correspondence between foreign kings and Median rulers, neither from Babylonia nor from any other country. In the entire 3000-year history of the Ancient Near East, the Medes would thus have established the only “empire” from which no kind of textual documentation, neither from inside nor from outside, has survived to this day.

In addition to these negative findings, which result from careful reevaluation of existing evidence, the model of a geographically and chronologically limited political “confederation” dominated by Iranian peoples has been developed as an alternative to the notion of a Median “empire.” In the short term, this confederation likely played an important role in the immediate aftermath of the fall of the Neo-Assyrian Empire, though it was never to develop comparable imperial structures. Indeed, a prime motivation of the members of this “confederation” is said to have been raids reaching as far as central Anatolia. There was no organized “rule” as such, no stable authority, as the “confederation” was in itself a short-lived collective brought together by momentarily overlapping goals and ambitions. As such, it was more likely dominated by short-term alliances and dependencies which would scarcely have endured beyond the next raiding season. If any coherent order of rule developed at all, as this theory goes, it could only have happened in the central Zagros region between Lake Urmia and Elam. The loose, mixed structure of the short-termed Median confederation is also confirmed by the wording of the Nabonidus inscriptions, which carry clear connotations of disorder and chaos when dealing with the Medes. The Medes’ appearance is characterized as a great flood and their military organization is described as a loose confederacy with primitive hierarchies. Significantly, this confederation revolving around a charismatic leader is circumscribed by the formulation of “Kings who march at his side” (Rollinger 2003a: p. 318). Moreover, particular verses in the Book of Jeremiah paint a similar picture by describing Median kings (plural!) as part of a larger federation (Liverani 2003).

It should be pointed out that, in all honesty, these arguments are likewise more probabilities than conclusive proof. There is room for interpretation, in any case: one may or may not agree on the applicability of the “secondary state formation” model and its implications for the Zagros region. Likewise, one may find the terminology of the Nabonidus inscriptions too vague or too obviously following Neo-Babylonian preconceptions of Medes as “barbarians” to be helpful, or even doubt the historical value of biblical texts in general. The synonymy of “Medes” and “Persians” for Greeks could be explained in a different way: the relationship between Persians and Medes could still be conceived as one between vassals and overlords, and, finally, the new interpretation of Nabonidus Chronicle ii 16 could be challenged.

Still, taken together with negative evidence for a Median “empire,” the evidence presented in favor of a loose confederation of peoples does seem to comprise a sustainable basis for this hypothesis. It must, of course, remain a hypothesis, but one with a relatively coherent and dense line of argumentation that is more plausible than previous explanations.

NOTES

- 1 It is interesting to note that some recent and very prominent handbooks on Iranian history even appear reluctant to deal with the problem at all and do not include a chapter on the Medes: Daryaei (2012) and Potts (2013).
- 2 Additionally, one has to stress that the perception of space is not an absolute value – 2300 km was a much larger distance in Cyrus' times, when Lydia was perceived to be at the western fringes of the world.
- 3 The adoption of the term "Mede" as a general synonym for "Persian" in Greek sources, attested since the later sixth century BCE, can be seen as evidence of an ephemeral contact between Medes and Greeks in Asia Minor that originated in Median raids to central Anatolia.
- 4 The alleged intermediary role in transmitting Neo-Assyrian artistic traditions with political connotations subscribed to the Medes by modern scholars can be ascribed to Elam or to the Neo-Babylonian Empire (Seidl 1994; Liverani 2003; Waters 2005: p. 527).

FURTHER READING

Lanfranchi, Roaf, and Rollinger 2003 (together with Waters 2005 and Rollinger 2020a) present the best and most comprehensive overview on all available sources of the “Median dilemma” and the problems connected with this issue. Adali 2011 offers a broad introduction to the concept of the ethnic term Umman-manda in Mesopotamian sources. Sancisi-Weerdenburg 1988 and 1995, as well as the less well-known but nevertheless excellent paper Kienast 1999 are still masterpieces of historical analysis of the problem. This also goes for Liverani 2003. On Herodotus and Ctesias see the various contributions in Rollinger, Truschnegg, and Bichler 2011, and Wieschöfer, Rollinger, and Lanfranchi 2011; cf. also Waters 2017. For the problems connected with the reconstruction of the Median language, Rossi 2010 and 2017 are excellent introductions.

CHAPTER 26

Urartu

Mirjo Salvini

On the southern slope of the Rock of Van, on the eastern shore of Lake Van in eastern Turkey, still today one can admire this trilingual inscription by Xerxes, son of Darius (Figure 26.1):

“A great god is Ahuramazda, the greatest of gods (...) (16–27) Saith Xerxes the king: King Darius, who was my father, he by the favour of Ahuramazda built much good (construction), and this niche he gave orders to dig out, where he did not cause an inscription (to be) engraved. Afterwards I gave orders to engrave this inscription. May Ahuramazda together with the gods protect me, and my kingdom, and what has been built by me” (Schmitt 2009: pp. 180–182: XVa).

In spite of its generic content, there is a symbolic and programmatic significance in the very fact that this inscription was engraved in the central part of Van Kalesi (Figure 26.2), the old Urartian capital Դաշքա, beside the monumental rock chambers and inscriptions of the Urartian kings of the ninth and eighth centuries BCE. This is the only royal Achaemenid inscription outside of Persia. Its position proves that Darius and Xerxes were fascinated by the site and recognized the importance of the old kingdom of Urartu – henceforth part of the Achaemenid Empire as the satrapy of Armina (Old Persian § 6 I: Schmitt 2009: pp. 36–91)/Uraštu (Accadian § 6.23.24: Malbran-Labat 1994) – for the ideology of their kingship (Seidl 1994).

Figure 26.1 Van, trilingual rock inscription of Xerxes I.

Figure 26.2 The Rock of Van in 2008.

Although *Ṭuṣpa* at Xerxes' time had been abandoned for one and a half centuries, the monumental achievements of the Urartian kings were certainly visible between the end of the sixth and the beginning of the fifth centuries BCE.

It would be astonishing if the Persian kings, knowing the accomplishments of this civilization, which was older than the Median one, were not somewhat influenced by it.

Assyrian Records on Urartu

In the Assyrian annals we first encounter the name of Urartu (in the forms Uraṭri/Uruaṭri), which was one of the principal objectives of the Assyrian expeditions toward the northern mountains from the Middle Assyrian period on, that is to say starting from the thirteenth century BCE (Salvini 1995: 18 ff). The populations that settled north of the Taurus range were repeatedly invaded by the Assyrian armies of Shalmaneser I (1273–1244), Tukulti-Ninurta I (1243–1207), Tiglath-pileser I (1114–1076), and Aššur-bel-kala (1073–1056). The name Urartu is attested in the Assyrian annals from the ninth century onward. But also Nairi (RIA s.v.) is important for the history of Urartu, because the first Urartian kings of the ninth century BCE, Sarduri I (RIA s.v.) and his son Išpuini (in the Assyrian version of his bilingual stela of Kelišin: CTU A 3-11) claimed to be “king of the country of Nairi,” thus linking up with a prestigious political tradition of the independent mountain populations. The cuneiform inscriptions of Išpuini and the following kings designate them even as “King of the country of Biainili,” a local name which later corresponds to Urartu in the Assyrian version of the bilingual stelae by Rusa I (CTU A 10-3, Movana, and 5, Topzawa).

One of the natural gates through the eastern Taurus lies on the modern road connecting Diyarbakır with Bingöl. In the eleventh century BCE Tiglath-pileser I, and after him Shalmaneser III in the ninth century, left written records on the border of the Urartian territory: the famous reliefs and inscriptions on the “Tigristunnel” (RIA s.v.). The annals of Shalmaneser III record the conquest of Sugunia, the city of “Aramu, the Urartian,” in 858 BCE and his “royal city” of Arzaškun in 856 BCE. In 832 BCE the Assyrian field marshal crossed the river Arsania (Murad Su) and defeated “Seduru, the Urartian” (RIA s.v. Salmanassar III). This new name is the link with the indigenous Urartian documentation, namely with Sarduri I (RIA s.v.).

Tušpa, Center of the Urartian Power: Sarduri I

The oldest building in Van Kalesi is the “Sardursburg,” defined thus by Lehmann-Haupt during his “Armenische Expedition” in 1898–1899 (Lehmann-Haupt 1926: 18 ff). This structure of huge well-squared limestone blocks laid in five regular courses was probably a quay or wharf. Six cuneiform inscriptions are carved into these blocks in the Assyrian language and Neo-Assyrian ductus. They are all duplicates of the text of Sarduri I (c. 840–830 BCE), who must be considered as the founder of the Urartian capital Tušpa (Salvini 1995: pp. 34–38):

Inscription of Sarduri, son of Lutipri, great king, powerful king, king of the universe, king of Nairi, king without equal, great shepherd, who does not fear the fight (...). Sarduri says: I have brought here these foundation stones from the city of Alniunu, I have built this wall (Wilhelm 1986: p. 101).

With this written document, which was discovered by the pioneer Schulz together with other 41 Urartian inscriptions (Schulz 1840), begins not only the history of the Urartian kingdom but also the written documentation for the entire mountainous region stretching across eastern Turkey, Armenia, and Iranian Azerbaijan.

We have no other written records signed by Sarduri I documenting his deeds, but the very fact that he fought against the powerful Assyrian king Shalmaneser III demonstrates a certain political importance and military power.

Sarduri's Successor

Sarduri's son Išpuini (end of the ninth century BCE) introduced the use of the indigenous Urartian language, the language of the dynasty. He left us some building inscriptions celebrating the construction of a system of fortresses around Van (CTU A 2). Very soon he involved his son and heir apparent Minua in his military expeditions directed to far-lying countries such as the region north of the river Araxes, the basin of Lake Urmia, and the province of Nakhičevan.

The two kings campaigned against the tribes of Luša, Katarza, and Uiteruḫi in today's Armenia (CTU A 3-4–A 3-7) and in the modern territory of Nakhičevan (CTU A 3-8).

King Išpuini, "Lord of the city of Țuṣpa," achieved the final unification into one state of all the peoples settled over a wide territory of the Armenian highland, and also the annexation of the territory east of the Zagros mountains, the modern territory of Iranian Azerbaijan. We have no idea of the ethnic composition of the new state. All we can say for the Urartians, who were the driving force and center of the kingdom, is that according to the language of the royal inscriptions, they were neither Semites nor Indo-Europeans. They were related only to the Hurrians who are attested from the end of the third to the beginning of the first millennium BCE in many regions of the Near East (Salvini 2000). However, the element binding the peoples unified in the Urartian kingdom was not only the use of the Urartian language in progressive substitution of the Assyrian one.

The Religion as “*Instrumentum Regni*”

Išpuini was the first Urartian king who knew how to exploit the religious element, which would become the basis of the state. There are two major written documents testifying to this policy. The first is the Kelišin stela (CTU A 3-11), erected on the 3000 m high pass of the Zagros range, which deals with a political pilgrimage by Išpuini and his son Minua around 810 BCE to the temple of the god Țaldi in Mušařir. The Kelišin stela shows that the city-state and international sanctuary of Mušařir, situated in today’s Iraqi Kurdistan, was controlled by the Urartians around 820–810 BCE, the period in which we must date the numerous joint inscriptions of Išpuini and Minua.

The most meaningful evidence of Išpuini’s policy is the open air sanctuary of Meher Kapısı near Van, with its rock inscription (CTU A 3-1) fixing the whole Urartian pantheon headed by the supreme triad: the god Țaldi, the weather god Teiřeba (cf. the Hurrian Teřub), and the sun god řiui. It is an inventory of animal sacrifices offered to a long list of gods and goddesses, in connection with the seasonal labors of agriculture. Such a monument and its ideology were the consequence of the conquest and the establishment of a protectorate over the city-state of Mušařir and its international sanctuary of god Țaldi. Išpuini, introducing the cult of Țaldi in his realm, must be considered as the second founder of the Urartian state on a theocratic basis. From that time the Urartian kings stood under the “protection” (Urartian *uřmaře*, Assyrian *řillu*) of their national god Țaldi.¹ They gave, in fact, enormous importance to Țaldi’s temple at Mušařir, at least from the time of Išpuini up to Rusa I, when the final clash with the Assyrians took place, namely in 714 BCE with the Eighth Campaign of Sargon and the sack of Mušařir (Thureau-Dangin 1912).

During the time of the co-regency between Išpuini and Minua (c. 820–810 BCE) the most important military expeditions were directed eastward, beyond the Zagros range. The Karagündüz stela (CTU A 3-9) records a single campaign directed against Meřta and three other cities, and the land of Parřua, an early mention of Persian tribes. The name of the city of Meřta is the link with the plain between Nagadeh and Miyandoab, south of Lake Urmia in Iranian Azerbaijan. In fact, it is mentioned also in the later inscription of Minua in Tařtepe (CTU A 5-10). Thus I suggested the identification of Meřta with Tappeh Hasanlu (in Pecorella and Salvini 1984: pp. 19–21) because it was the main city in that region at the end of the ninth century BCE (Salvini 1993). This seems to fit well with the burned level of Hasanlu IV and with its radio-carbon dating (Muscarella 2012). However, one cannot exclude an alternative

identification with another site, for example Nagadeh, in the same region, but this would not change the matter. Even Paršua, or part of it, should be located in this period not far from the southern shore of Lake Urmia. But this contrasts with the location of Paršua (RIA s.v.) further to the south, even on the basis of the Assyrian texts of the ninth century BCE itself (Salvini 2009).

The Urartian presence at Hasanlu, in level IIb, has to be stressed particularly: the so-called “Fortification Wall II” was built by the Urartians around the eighth century BCE (Dyson 1989: pp. 6–7). Moreover, with regard to the northwestern shores of Lake Urmia, we must add the presence of the Urartians in the valley of Salmas, as is attested by level III at Haftavan Tappeh (Burney 1971).

The Citadel of Van Kalesi and Its Historical Monuments

The acropolis of the Urartian capital lies on the central section of the rocky crest (Figure 26.2). Situated on the highest point of the rock (approximately 90 m), its perimeter follows the line of the rock, as may clearly be noted from the south side.

The northern wall of the citadel reveals different building phases. The great size and quality of the squared-off stone blocks at the base of the wall show similarities with the “Sardursburg” and must date back to the time of Sarduri I, although we do not have a foundation inscription to confirm this.

On the southern slope of Van Kalesi are the chambers of Horhor, the main monument left to us by Argišti I, son of Minua (André-Salvini and M. Salvini 1992, with previous bibliography). The long inscription of his annals with the deeds of the king, decorating the entrance of this rock mausoleum, is the most extensive document in Urartian cuneiform epigraphy (CTU A 8-3). Not only the conquests in Transcaucasia and in northern Iran are celebrated here but even the foundation of two important towns in Armenia, namely Erebuni and Argištiḫinili. Many rock tombs (beside some other huge chamber complexes of unknown purpose) are still visible on the south slope of Van Kalesi, which can be linked with the later Achaemenid rock tombs (Calmeyer 1975). An important architectural feature which connects the two civilizations is the Urartian tower temple (high, square with edge buttresses, and with one single cella), which is perhaps the precedent of the Kaba-ye Zardušt (Stronach 1967, 2012).

The Annals of Sarduri II in Hazine Kapisi (CTU A 9-1-3)

On the northern slope of the eastern sector of Van Rock the Russian expedition of 1916 unearthed the famous text of the Annals of Sarduri II, son of Argišti (Marr and Orbeli 1922). The first successful military expeditions of

this king, who reigned between 755 and c. 730 BCE, are summarized at the beginning of his annals: the conquest of the lands Uelikuhî in Armenia, Tulihû in Transcaucasia, and, most importantly, a victory over the Assyrian king Aššurnirari V (754–746 BC) in the first years of his reign (Salvini 1995: 66 ff). Following his father, Sarduri made expeditions against the countries of Mana (Assyrian Mannea: RIA s.v.), Babilu, and Baruata in Iran, and Etiuni and Erikuaḫi in Armenia, with the conquest of the southern shore of Lake Sevan. Furthermore, he reached the northern land of Qulḫa, in which we identify the oldest record of classical Colchis.

The expedition against Miliṭia (modern Malatya), recalled in the annals (in CTU A 9-1 rev.), was recorded on the rock (CTU A 9-4) overlooking the Euphrates on the bank opposite to the Melitene. Beyond the Euphrates, in the region of Commagene (Assyrian Kummuhî, Urartian Qumaḫa), one of the greatest struggles between the Assyrians and the Urartians took place in 743 BCE (RIA s.v. Sarduri). The Annals of Tiglath-Pileser III relate the Assyrian victory in the battle of Commagene, pushing the Urartians back to the east of the river which marked the western frontier of the Urartian kingdom (Tadmor 1994: pp. 100–101).

The Urartian expansion in Iranian Azerbaijan, toward the Caspian sea, is testified by the rock inscription (CTU A 9-8) and the fortress of Seqendel (Kleiss and Kroll 1980), east of Tabriz, recording the conquest of the country of Puluadi and its capital city Libliuni together with many fortresses. In the Annals of Sarduri (CTU A 9-3 D 8-13) the same episode is narrated.

The War Between Rusa I and Sargon for the Control of Northwestern Iran

The Assyrian sources tell us that under Rusa I (c. 730–713 BCE), the contacts between Urartians and Mannaeans became more intense, and we can assume the existence of a direct influence of Urartu on the northern Mannaeen territories: a kind of protectorate. The Mannaeen prince Metatti of Zikirtu is presented as a vassal of king Rusa, and this situation soon led to a war with Assyria (Salvini in Pecorella and Salvini 1984: pp. 35–51).

During Rusa I's reign, west Azerbaijan was the center of important historical events (RIA s.v. Rusa). The three bilingual stelae erected by Rusa I on both sides of the Zagros range (CTU A 10-3, 4, 5) show that the road along the western shore of the Urmia lake and through the pass of Kelišin was still the main access route of the Urartians through the Zagros to the city and temple of Muṣaṣir. The common text of those three documents tells us of the defeat of the local king Urzana, who had behaved like an enemy against Rusa, preventing him from entering Ḫaldi's sanctuary.

Rusa was at the height of his power: he had conquered the lands in Transcaucasia, at the expense of the tribes living beyond Lake Sevan (CTU A 10-2). Moreover, he ruled a large part of the Mannaeen territory and Muşasir, even reaching the valley of the Lesser Habur river.

But Rusa's "days of joy" were suddenly interrupted by two political-military catastrophes, which would be fatal to him. These are the Cimmerian invasion and Sargon's Eighth Campaign in 714 BCE (Thureau-Dangin 1912). The relative chronology of the two events, as well as their "geography," is controversial (one can read the different opinions in *Biainili-Urartu* 2012).

The news of a military clash between Urartu and the Cimmerians (Gimirra) appears in the letters of the Assyrian intelligence service. Some letters to king Sargon refer directly to this event, and they speak of the Urartian's defeat and losses. Other letters deal with the Urartian preparations for the expedition against the "land of Gimirra" (Lanfranchi and Parpola 1990).

The letter SAA V 145 (Deller in Pecorella and Salvini 1984: pp. 102–103. No 2.1) clearly says that the Cimmerians came "from the land of Mana," that is from the southeast, not directly from the north, i.e. from the Caucasian mountains, as the traditional reconstruction maintains. I think that this episode took place not long before the Eighth Campaign, perhaps in 715 BCE.

The Last Century of the Urartian History

During the seventh century BCE the relations between Urartu and Assyria apparently became peaceful. Argišti II, successor to Rusa I, was concentrated in the northern territories, as we learn from his rock inscriptions in Azerbaijan and a stele in Armenia (CTU A 11-3,4,5,6), and his son Rusa II excelled in the construction of beautiful fortified towns and residences like Karmir-blur, Bastam, Kef Kalesi (literature by Zimansky 1998), Ayanis (Çilingiroğlu and Salvini 2001), and Toprakkale. The construction of Toprakkale (RIA s.v. Rusaḫinili) was probably begun by Rusa II and completed by Rusa III, son of Erimeña. He was the reformer of the Urartian state organization, introducing writing on clay tablets and bullae, unknown before, and the parallel use of a linear (hieroglyphic) script for administrative purposes. The excavation of his towns has restituted a great quantity of bronze objects, which is the most known achievement of the Urartians (Seidl 2004). Rusa III, son of Erimeña, constructed the huge dams of the Rusa Lake (modern Keşiş Göl) for the irrigation of the plain of Van and the residence of Toprakkale (CTU A 14-1,2). The succession of both homonymous kings is controversial (Seidl 2007; Salvini 2007), and the circumstances of the end of the Urartian kingdom are still obscure (different solutions are reflected in some contributions of *Biainili-Urartu* 2012, especially by Ursula Seidl and Michael Roaf).

Robert Rollinger (2009), on the basis of a new reading of the Nabonidus Chronicle, maintains that Urartu was not destroyed by the Medes in the seventh century BCE but survived until the campaign of Cyrus in 547 BCE. It is possible that some form of state survived after the extinction of the written records, but it was no more the imperial power of the preceding centuries. A few decades later, with his equation Armina = Uraštu, Darius testifies the presence of the new ethnic element, the Armenians, in the old Urartian territory. If we speak of political continuity, we have to stress that no one of the usurpers against whom Darius fought presents himself as the king of Urartu, and there is no reference to the old capital city of Tušpa. However the name Haldita (Bisutun § 39) proves that at least the cult of the god of Muşaşir survived after the end of Urartu.

The last mentions of Urartu, in the Babylonian form Uraštu, refer to a geographical area more than to a policy. Nevertheless, some cultural influences could have entered the Achaemenid Empire. Besides the abovementioned elements we can find a precedent for the phenomenon of inscriptions written in the name of the ancestors, like those of Pasargadae (Schmitt 2009: CMA, CMb→DMc), written by Darius in the name of Cyrus, and of Genç Nameh, written by Xerxes (Schmitt 2009: p. 10) for his father Darius: the duplicate inscriptions of Işpuini's fortress in Zivistan (CTU A 2-2A–E), south of Van, were certainly engraved in the second part of the reign of his son Minua (CTU IV pp. 321–322).

Urartian Chronology

Assyrian kings	Synchronisms (see Fuchs 2012)	Urartian kings
Shalmaneser III (859–824 BCE)	Quotes Ar(r)amu the Urartian (years 859, 856, 844 BCE)	[no written records]
Shalmaneser III	Quotes Seduri, the Urartian (year 832 BCE)	[written records of:] = Sarduri I, son of Lutibri ^a (c. 840–830 BCE)
Shamshi-Adad V (823–811 BCE)	Quotes Ušpina (year 820 BCE)	= Işpuini, son of Sarduri (c. 830–820 BCE) Co-regency of Işpuini and Minua (c. 820–810 BCE)
	[no synchronism]	Minua, son of Işpuini (c. 810–785/780 BCE)

Assyrian kings	Synchronisms (see Fuchs 2012)	Uartian kings
Shalmaneser IV (781–772 BCE)	Quotes Argištu/i (year 774 BCE)	= Argišti I, son of Minua (785/78–756 BCE)
Ashur-nirari V (754–745 BCE)	Quoted by (year 754 BCE)	Sarduri II, son of Argišti (756–c. 730 BCE)
Tiglath-pileser III (744–727 BCE)	Quotes Sarduri, Sardaurri (years 743, 735? BCE)	= Sarduri II
Sargon (721–705 BCE)	Quotes Ursā/Rusā (years 719–713)	= Rusa I, son of Sarduri (c. 730–713 BCE)
	Quotes Argišta (year 709 BCE)	= Argišti II, son of Rusa (713–? BCE)
Sennacherib (704–681 BCE)	[no synchronism]	
Esarhaddon (681–669 BCE)	Quotes Ursā (year 673/672 BCE)	= Rusa II, son of Argišti (first half of the seventh century BCE)
		Erimena (^{LÚ} ašuli?) ^b
Ashurbanipal (669–627 BCE)	Quotes Rusā (year 652 BCE) ^c	= Rusa III, son of Erimena
Ashurbanipal	Quotes Ištar/Issar-dūri (year 646/642 BCE)	= Sarduri III, son of Sarduri

^a No written records of him.

^b Cf. my attempt to interpret the seal of Erimena, and the chronological problems concerning the seventh century BCE: Salvini 2007.

^c We have to take into consideration the new dendrochronology following which Rusaḫinili Eidurukai (Ayanis) was built in the second half of the 670s BCE: Manning et al. 2001, p. 2534; Çilingiroğlu 2006, 135.

Last Records on Uraṣtu

Nabopolassar (625–605 BCE): pīḫāt ^{KUR}Uraṣtu (years 608, 607 BCE)

Sedekias, King of Juda (568–587 BCE): ʾrrt (year 594 BCE)

Nabonidus Chronicle 7, 15–18 (year 547 BCE): ʾÚl-[raṣ-tu (Cyrus II)

Babylonian sources of the sixth century: ^{LÚ}Uraštaja (nisbe)

Babylonian Map of the World: Uraṣtu

Darius I (521–486 BCE), Bisutun: Uraṣtu/Armina

Xerxes (485–464 BCE): Uraṣtu/Armina

Darius II (424–404 BCE): Uraṣtu

Artaxerxes II (404–359 BCE) or III (359–358 BCE) (Persepolis):
Arminiya

CHAPTER 27

From Assurbanipal to Cambyses

Robert Rollinger

Introduction

Having a look at handbooks dealing with the history of the Ancient Near East, older as well as more recent ones, there appears to be a general agreement on the outline of the political history of the first millennium BCE. The epoch is conceptualized as a succession of three clearly defined empires. The first one, the Neo-Assyrian Empire, is regarded as representing a turning point in history by its establishment of imperial structures that are connected with the claim to rule the world. It is succeeded by the Neo-Babylonian Empire and the Persian Empire which, on the one hand, follow the imperial trajectory introduced by the Assyrians but, on the other hand, have their own individual and distinctive conceptions of empire and state.

This more or less canonized modern view of the historical development of the first millennium BCE has its merits. The three empires are dealt with as different states that created different bureaucracies and ideologies. They are ruled from different core areas and are controlled by distinctive social elites who are the decisive pillars of the state and give it structure and meaning. More precisely, the Neo-Assyrian empire had a well-defined core area formed by the River Tigris and its two major tributaries, the Upper and the Lower Zab, where all major centers of the empire were located, i.e. from north to south, Dūr Šarrukīn, Ninua (Nineveh), Arba'ilu, and Assur (Libbi-āli). The empire, including the provinces, was conceptualized as “land Aššur” (māt

Aššur) and ruled by a king who acted in accordance with and as an agent of the god Aššur (cf. Lanfranchi and Fales 2006; Radner 2014; Frahm 2017).

The Neo-Babylonian Empire's core region was Babylonia, i.e. the alluvial plains to the south of modern Baghdād including the area along the lower Diyala river. There was only one royal seat, i.e. Babylon, and the core area was defined as the "land of Sumer and Akkad." The king who, in contrast to his Assyrian counterpart, did not also act as a priest, ruled as an agent of Marduk and Nabû (Jursa 2014).

With the Persian kings another shift took place. For the first time the imperial core area was outside Mesopotamia proper, although there was a royal palace in Babylon and the city still enjoyed a high level of prestige. However, the king's and the leading elites' identities were no longer Babylonian but were bound to western and southwestern Iran. Anšan/Pārsa (modern Fārs), Elam, and Media (central western Iran) were defined as the new core areas, where the kings resided in newly constructed palace complexes at Ekbatana (Hamādan), Susa, Pasargadai, and Pārsa (Persepolis) (Wiesehöfer 2009; Rollinger 2014a). Beginning with Darius I the god Ahuramazda played a major role, and the leading imperial elites were distinctively Iranian and formed an "ethno-classe dominante" (Briant 1996) all over the empire (Jacobs 2012; Rollinger 2015; Wiesehöfer 2016). In the core areas the kings started to erect inscriptions in three different languages, and additional translations were made and distributed in other parts of the empire. The imperial and multilingual character of the state is also visible in the fact that, beyond this general outline of imperial representation, the kings presented themselves differently in different parts of the empire. In Babylonia they acted as Babylonian kings, whereas in Egypt they presented themselves as Egyptian pharaohs. This kind of political flexibility and diversification was only partly anticipated by the Neo-Assyrian kings, when some of them tried to engage as kings of Babylon as well. As far as we know, the Neo-Babylonian kings never acted in a similar way, but were eager to demonstrate the Babylonian character of their kingship. Seen through this lens the traditional view of these three empires as distinct and individual entities appears to be justified. But there are other aspects that deserve to be considered as well.

On the one hand, the idea of three distinctive empires is to some extent a very modern one. Although, as has already been indicated, there are good arguments for this idea, it is only one side of the coin. When we look at the Babylonian king lists, as far as they are preserved for this period and as far as they cover the entire period of Neo-Assyrian, Neo-Babylonian, and Persian history, there is no clear distinction between these empires. This is astonishing, for Babylonian king lists dealing with other periods definitely provide the dynastic affiliation for a number of rulers: see, for example, Babylonian King List A, which even notes different branches of Neo-Assyrian kings originating

from just one family (Fales 2014). It is evident that the king lists in question exhibit a specific perspective, although other more contemporary sources, for example Nabopolassar's royal inscriptions, are keen to underline the fact that a new era started with this king's reign (Da Riva 2013: pp. 5–9). Thus, the king lists demonstrate that a retrospective emic view could ignore the breaks between different dynasties and highlight continuity.

The Uruk King list covers a period from Kandalānu (647–627 BCE), who reigned as Assurbanipal's puppet king in Babylonia, to Seleucus II (246–226 BCE). Without any notation or dividing line, Nabopolassar (625–605 BCE), the founder of the Neo-Babylonian Empire, succeeds Sin-šarru-iškun (627–612 BCE), the last Neo-Assyrian king who was inaugurated as king in the city of Assur. The same is true for Cyrus the Great who follows Nabonidus (556–539 BCE), the last king of the Neo-Babylonian Empire. And it also applies to Alexander the Great who seamlessly succeeds Darius III, and to Antigonos Monophthalmus who follows Alexander's half-brother Philip III, as well as to Seleucus I who follows Antigonos, although it was he who founded the Seleucid Empire. What we have is an apparently continuous line of kings without a marking of "state" or dynasty. There is no distinction at all between these rulers. The same applies for another important document that is still the backbone for our chronology of the first millennium BCE. The so-called Ptolemaic Canon is a king list that is preserved in a considerable number of manuscripts (Depuydt 1995). It starts with the Babylonian king Nabu-nasir and continues through Neo-Babylonian, Persian, Seleucid, and Ptolemaic times until the Roman Empire. In this case too shifts in the conception of empire are only recognizable indirectly. This is especially true for the shift from Babylon (Neo-Babylonian, Persian, and Macedonian kings) to Alexandria (Ptolemaic kings) and from there to Rome. Concerning the layout of the document there is no distinction between the Babylonian and Persian kings. Together with Alexander the Great they form a continuous line of kings that all subscribe to the era of Nabu-nasir. Only with Alexander's half-brother Philip III does a new era start that continues through Roman times (Depuydt 1995). It is true that the document was only used for astronomical counting, but it is nevertheless interesting to note that our modern conception of empire did not play any role in it at all.

On the other hand, it becomes increasingly obvious that major developments in the history of the Persian Empire can only be adequately understood when they are seen in larger historical contexts. The three empires share a common stream of tradition that cannot be ignored, which affects culture, kingship, ideology, world view, and bureaucracy. This also applies for general political developments that concern conquest, dynasty, self-perception, and the fundamental question of the stability or weakness of these three empires. Thus, for a better understanding of the Persian Empire it is necessary to

develop a broader perspective and locate it within the context of a succession of Ancient Near Eastern empires, a context that starts with the evolution of the Neo-Assyrian Empire some centuries before.

General Aspects of *Longue Durée* Developments: Conquest and Growth of Empire

Where conquest and growth are concerned, the Persian empire can be described as a direct successor of the Neo-Assyrian Empire. From the time of Ashurnasirpal II (883–859 BCE) and Shalmaneser III (858–824 BCE) the Neo-Assyrian state developed as an empire. The backbone of this progression was a powerful and increasingly multiethnic army that was successfully professionalized (Fuchs 2011). With this powerful instrument the Neo-Assyrian kings started to conquer all the core areas of the Ancient Near East beginning with northern Mesopotamia, parts of southern Anatolia and northwestern Iran. Under Tiglath-pileser III (746–727 BCE) the regions to the west of the Euphrates were organized as provinces and permanently integrated into the empire. Babylonia was ruled in personal union, and southern Anatolia and western Iran became part of the empire. Sargon II (721–705 BCE) and his son Sennacherib (705–681 BCE) consolidated these achievements. The last independent city-states on the Upper Euphrates and in southern Anatolia were eliminated, Cilicia became a province, and the city-states of Cyprus were controlled as vassals. Assyrian influence reached as far as Tabal (Cappadocia), parts of the central Zagros area were provincialized, and Urartu, a cumbersome political competitor, was beaten and reined in. Only Babylonia continued to create problems, which were not solved until the reigns of Esarhaddon (680–669 BCE) and Assurbanipal (668–631 BCE), when Assyria reached its apogee. Control of Tyre meant that the Assyrian perspective now included the whole Mediterranean as far as the Straits of Gibraltar (Rollinger 2008, 2014b). The delta of the Nile and Upper Egypt were conquered, and Arabian tribes in Syria and on the Arabian peninsula acknowledged Assyrian suzerainty. An ensemble of tribes that the Assyrians called *Madāya* (Medes) was also controlled by the empire, whose influence in the east probably reached as far as the region of modern Teheran (Radner 2003; Rollinger 2007). Another political competitor, Elam in southwestern Iran, was beaten decisively, and diplomatic ties were established with the emerging power of Lydia in western Anatolia. The Assyrian Empire ruled the “world,” and this claim was verbalized and disseminated by the inscriptions of the Neo-Assyrian kings (Rollinger 2014b). So far, the history of the empire was a history of ongoing conquests and imperial growth and contemporaries may have thought that this empire would never come to an end and soon subdue all the remaining independent

states in the Middle East. Yet, this was a fallacy, or, at least partly, an erroneous belief. It was a fallacy because within 20 years of the death of Assurbanipal the empire crumbled and disappeared from the political landscape (Liverani 2001; Fuchs 2014). But at the same time it was only partly an erroneous belief since the Assyrian heritage remained intact because the structure and idea of an empire established by the Assyrians survived and kept its dynamics for the next 300 years at least.

From a higher and overarching perspective that focuses on the expansionist structure of empires (Gehler and Rollinger 2014), the Neo-Assyrian Empire was succeeded by a period of about two-thirds of a century when no new dynasty could be established. The ruling monarchs were eager to maintain the imperial idea, but this idea was expressed in an entirely new form. Although the empire was reestablished after the conquests of Nebuchadnezzar II (605–562 BCE), this did not happen on the same scale as before, and the empire's ongoing expansionist dynamic clearly faded. It is true that Neriglissar (560–556 BCE) and Nabonidus waged wars in the west and that the latter was heavily engaged on the Arabic peninsula. But the general outline of their politics was much more focused on preserving what had already been achieved than on opening up new areas of conquest. This defensive element in imperial policy was a distinctive characteristic of the Neo-Babylonian Empire, and it comes as no surprise that in its royal inscriptions military affairs only play a minor role (Da Riva 2008). Apart from some areas on the northwestern Arabian peninsula, which were controlled by Nabonidus, not a single region was subdued that had not already been under the sway of the Neo-Assyrian Empire. Preserving what had already been part of the Neo-Assyrian Empire was the motto, not subduing regions and areas which lay beyond its boundaries.

This period of imperial stagnation radically changed with the conquest of Babylon by Cyrus the Great in 539 BCE. With the Teispid Cyrus a new imperial power entered the stage of the Ancient Near East and, after about 70 years of expansionist standstill, reestablished a military vigor that not only vied with that of the Neo-Assyrians but eventually outperformed it and gave the idea of world empire entirely new dimensions. Because of a lack of sources we are not very well informed about each single step of the various conquests of Cyrus (about 550–530 BCE) and his son Cambyses (530–522 BCE). But these were major events that went far beyond the imperial achievement of their Neo-Assyrian predecessors. Already some time before the conquest of Babylonia, Cyrus had established a potent power base in Anshan, i.e. modern Fārs, from where he started to expand toward the north. We do not know exactly when he took control of the region of ancient Susiane, i.e. modern Khuzistān, but he certainly took a major step toward empire building when he subdued the mighty confederation of the Medes that ruled the central Zagros. This event

can be dated to 550 BCE, and from that time onward Cyrus controlled most of the resources of western and probably already central Iran (Rollinger 1999). In 547 BCE, Cyrus subjugated eastern Anatolia, where some successor states of the former Urartian Empire had stood the test of time (Rollinger/Kellner 2019). Sometime in the 540s he celebrated a further major victory, when he subjected the Lydian kingdom in western Anatolia. If we believe the account of the Greek historian Herodotus, other parts of western Anatolia were subdued by Cyrus' generals (Bichler 2000: pp. 263–266). This fits well with what we know from the Neo-Assyrian Empire where, besides the king, it was mighty magnates who were responsible for waging war (Mattila 2000). In any case, from this time onwards also Greek city-states in western Anatolia became part of the new empire being established by the Teispids. Thus, when Cyrus conquered the Neo-Babylonian Empire, he was no longer a nobody acting out of nowhere, but already ruled a strong and powerful state. This new empire included Mesopotamia and Syria as well and reached as far as the borders of Egypt. But this was by no means the end of the expansionist story.

We do not know exactly when Cyrus subjugated eastern Iran and vast regions of modern Central Asia as far as the river Iaxartes (Syr Darya). According to Greek sources it was toward the end of his reign (Bichler 2000: pp. 266–269). But this should not be taken uncritically as historical fact. The conquest of vast areas of central and eastern Iran could very well have been achieved step by step and Cyrus' son Cambyses may also have been involved in this major undertaking. In general, Greek sources have a very positive view on Cyrus. He is hardly ever described as aggressive, but much more as a heroic figure who only reacts when he is attacked or in danger (Shayegan 2018). This only changes when Cyrus started to campaign in Central Asia. Again, this campaign is only mentioned by classical sources (Bichler 2020). One of them, Herodotus, claims that Cyrus was killed in action while fighting against Central Asian nomads, whom the classical sources dub Scythians or Massagetae. Whether this is true or not cannot be verified, but the fact that some years later Darius I considered his victory over the Scythian leader Skunkha of such importance that he ordered a complete reshaping of the Bisitun monument in order to add a relief image of his opponent suggests that it was seen and celebrated as the defeat of an enemy who had even been able to resist Cyrus the Great (Waters 2014: p. 76; Rollinger/Degen 2020). In any case, with Cyrus, a new conqueror king entered the scene after the Neo-Assyrian kings. The astonishment and admiration aroused by these achievements are echoed not only by classical sources but also by the small Jewish community in Palestine and Babylonia, in whose eyes Cyrus represented the new Messiah. Yet, this new phase of expansion did not come to an end with Cyrus himself. Since the time of Esarhaddon and Assurbanipal, Egypt had been considered to be a part of the new Ancient Near Eastern imperial system. Where Nebuchadnezzar II had failed, Cambyses

achieved a major success. In a single campaign he subdued the land on the river Nile. As once again only classical sources testify, Cambyses probably also tried to get control of Cyrenaica and Nubia (Bichler 2000: pp. 270–272). Whether he failed and it was left to Darius I to include these countries in his empire is difficult to say (Giangiulio 2011). In any case, in the lists of lands which first appear in Achaemenid royal inscriptions in the reign of Darius I, Nubia/Ethiopia (Kūšā) and the people to the west of Egypt (Putāyā) were claimed to be part of the empire. The same is true for Cyprus, which was under control of the Persians from Darius I onwards at the latest (Wiesehöfer 2011).

Although the change from the Teispids to the Achaemenids was accompanied by a disastrous war that afflicted the whole empire, expansion did not come to an end with the establishment of a new dynasty by Darius I (521–486 BCE). With the first two kings, Darius I and his son Xerxes I (486–465 BCE), the expansionist agenda continued. As already mentioned, Darius I partly subjected the nomads of Central Asia and he enlarged the empire in the east as far as India, western regions of which, i.e. modern Pakistan, became part of the empire. The Scythian campaign to the north of the Black Sea, on which classical sources report, might never have taken place (Tuplin 2010; Rollinger/Degen 2020). But Thrace became a part of the empire and Macedonia a vassal state (Boteva 2011; Zahrnt 2011; Vasilev 2015). For the first time in the history of Ancient Near Eastern empires, the expansionist agenda was not only pursued via land forces. With the help of the city-states of the Syrian coast an imperial fleet was created, probably already under Cambyses, when he campaigned against Egypt and took control of Cyprus (Müller 2016). This navy became even more important when Darius began to operate in the Aegean (Klinkott 2020). With these endeavors, however, the empire appears to have suffered from imperial overstretch and it had to renounce direct control of the Greek world. Xerxes did at first try to follow the policy of his father and his Teispid predecessors, but in the end he established a new political doctrine and the empire entered a new stage in its history. As in Neo-Babylonian times, expansion was given up and the preservation of what had been achieved started to be the primary goal. Once again, this development was accompanied by new ideological positions in the royal inscriptions. Not only did waging war disappear from these texts, but history was regarded as having come to an end, since the Achaemenids claimed to rule the whole world. According to this ideology there was no power left that needed to be subdued (Rollinger 2014a). It is no surprise that this form of ideology was an integral part of the agenda of imperial preservation. And the empire was still very effective in this respect. Although the Aegean and Egypt were lost for some time, Persian influence could be successfully reestablished after some decades, in the first case indirectly with the King's Peace in 387 BCE, in the second directly with the reconquest of Egypt by Artaxerxes III in 343 BCE (Ruzicka 2012: pp. 66–82, 177–198).

When viewing Ancient Near Eastern history from this overarching perspective, the phase of preservation did not come to an end with the Achaemenids. It continued with Alexander the Great, who conquered huge parts of the Persian empire but was not able to add a single piece of land that had not already been under Achaemenid control. And the same holds true for about the first 100 years after Alexander's death, when first Perdikkas and Antigonos Monophthalmus and then the early Seleucids tried to secure what had been achieved by their Achaemenid predecessors. Only when the Seleucids failed with Antiochus III (222–187 BCE) and Antiochus IV (175–164 BCE) did the history of the Ancient Near Eastern empires, as it had been established by the Neo-Assyrian Empire, finally come to an end. This history had lasted for about 700 years, and the Teispid-Achaemenid Empire had been an integral part of it. Times of conquest had been followed by times of stagnation, which in turn gave way to periods when the expansionist agenda was reestablished. In the end, after the downfall of the Achaemenid Empire, people once again faced about 100 years of stagnation of imperial growth. In this long period imperial traditions were preserved to a considerable degree. Although dynasties changed and new imperial centers and regions emerged, the core areas of each imperial predecessor remained under the sway of the new empire. For this reason, it is not by chance that **the last preserved royal inscription in cuneiform originates from the time of the Seleucid king Antiochus I (281–261 BCE)** (Stevens 2014). Tradition still loomed large. But when the Seleucid Empire started to disintegrate, a new horizon of empire building emerged. There was no political power left that was capable of taking over the previous empire as a whole even simply to preserve it, let alone as a basis for a new expansionist agenda: the Achaemenid Empire remained the climax within this long-term development. Instead, with the Roman and Parthian Empires two new superpowers emerged on the fringes of this huge and ancient imperial structure. Neither of these two, however, was able to reconquer the whole; in the end, it was divided between them and a new era of two opposing empires started. This is another story, although in the succeeding centuries both opponents again and again tried to breach the newly established border at the river Euphrates. But neither the Roman emperors Trajan (98–117 CE) and Justinian (527–565 CE) nor the Sasanian Shahanshahs Khosrau I (531–579 CE) and Khosrau II (590–628 CE) were able to preserve their impressive short-term conquests for more than some years.

As we have seen, new powers emerged on the fringes of established empires and, after a period of coexistence, were prepared to challenge the older empire successfully. This phenomenon deserves attention and further explanation, since it is a characteristic of the long-term historical development of the Ancient Near East and has considerable relevance for the Achaemenid Empire.

Historians have long been aware that, both in antiquity and later, dynamic processes of “secondary state formation” take place on the fringes of empires and result in a sustained transformation of the societies in contact with those empires. Unfortunately, our written sources are frequently entirely ignorant about these revolutionary developments. They become visible only after the event, when political and military conflicts arise and we suddenly observe the results of what has been a long-term process. The encounters between, on the one hand, empires with comparatively highly developed bureaucracies and forms of political and administrative praxis, and, on the other hand, societies where political authority was less developed (often involving highly fragmented entities and an illiterate local culture) considerably changed the worlds of the latter. Both “center” and “periphery” became part of an imperial matrix that was defined by asymmetric relations. The newly established ties between these different worlds took various forms (Brown 1986; Harrison 2012: 633f.; Routledge 2016; Rollinger 2020).

On the one hand, trade and economic ties played a major role in the transformation of local systems and the introduction of new forms of exchange and economic mentalities. Smaller regions with their local economies and local production and exchange networks now became part of an imperial world system that not only triggered new kinds of specialization, but also opened up new markets and modes of exchange. These new conditions converted processes of production as well as the products themselves. Advances of this sort not only transformed local infrastructure and modes of production, but also had a big impact on the local elites who were in charge of these processes. These elites had previously focused on local networks, but suddenly entirely new possibilities of income and generating revenues emerged. These developments took place on the peripheries of empires, although these “peripheries” were not themselves a homogeneous world but were highly diversified. Increasingly they became crossroads of interaction, where local leaders, looking to their own interests, took advantage of the new basic conditions by monitoring and controlling transregional networks that were to a varying degree and with different nuances part of overarching imperial structures. How far these networks actually reached is difficult to say. But it has been demonstrated in recent decades that the networks triggered by the dynamics of the Neo-Assyrian Empire reached in the west as far as the Straits of Gibraltar and in the east as far as Central Asia and India.

On the other hand, the peripheries were open to various forms of sociopolitical influence from the adjacent empire. As already mentioned, the new streams of goods and commodities had to be organized and channeled. This in itself fostered political centralization and boosted the development of new political structures with transregional perspectives. But, again and again, the empire also demonstrated its presence on the “periphery” by political and

military intervention. The trajectory for such interventions was provided by the empire's thirst for expansion and the permanent and dynamic process of establishing new zones of direct and indirect rule. Empires do not have strictly fixed borders in the manner of modern national states, but develop border zones that are characterized by different modes of influence (Gehler and Rollinger 2014). Especially from the second half of the eighth century BCE onward there was a trend toward provincializing conquered areas and establishing direct rule via imperial bureaucracies. But, there were also various vassal states, where, on the surface, political control remained in the hand of local dynasties, but which actually became part of the empire (Lanfranchi 2011). And there was a zone beyond these structures, where there was still some indirect influence, be it through the vassal states and their governors or through diplomatic and economic ties. This ongoing process of political integration, which was also triggered by different modes of contributions, taxes, tribute, and "gift," substantially transformed the political structures of the "peripheries". Ways of ruling, political practice, imperial bureaucracy and administration, political ideology, political expression of power, and the economic basics for these new developments became common knowledge, were eagerly adapted and adopted, and created an entirely new type of local leader, one who copied and imitated imperial behavior but also became more and more aware of the possibilities of his own political agendas. Since these local leaders and their subjects generally contributed troops to the empire's army, they came into contact with the latter's superior military technology, and that was also taken up and readily acquired. Finally, there was the sophisticated high culture of the empire with its cities, temples, huge buildings, and material wealth, which not only established a measuring stick for local developments and orientations, but also generated a conception of pomp and circumstance that became an ongoing object of desire. This object could be sought by imitation and cultural transfer, but it could also provoke an appetite for appropriation, conquest, and plunder. With this a change in local mentalities went hand in hand. The empire was looked upon with fear and respect, admiration and hate (Melville 2015). One was part of the system, but at the same time able to develop new identities. The "periphery" had to find its place in a new world that was accomplished by integration and alienation at the same time. The new modes of thinking, exercising political power, and generating economic wealth were only possible because one was part of an imperial world system. Simultaneously, however, there was an overriding desire to ignore these bonds and to pursue one's own political ambitions in line with newly developed ethnic and sociopolitical identities. Complex developments of this sort were not an invention of the first millennium BCE, but the establishment of the Neo-Assyrian Empire provided an unprecedented stimulus for them to occur.

The result can be observed on all the “peripheries” of the Neo-Assyrian Empire but, at least for the time being, it took a somewhat different trajectory in the west, where the Mediterranean Sea hampered further territorial expansion. Things were different in the north, south, and especially in the east. Whereas in the west some kind of indirect control was guaranteed by taxing and monitoring the Levantine city-states (Bagg 2011), a process that went hand in hand with a spread of cultural and economic dynamics to the western regions, the exertion of influence on the political level was stronger in the other directions. The emergence of Urartu in the late ninth century BCE, the formation of Phrygia in the eighth century BCE and of Lydia in the seventh century BCE, as well as the establishment of the Neo-Elamite state in the seventh century BCE and the emergence of a united Babylonia in the same century, are developments that presuppose the existence and example of the Neo-Assyrian Empire. The same dynamics are operative in the east although the lack of suitable sources means that we are only able to understand these processes superficially. What we call “the Medes” is a conglomerate of different populations in the central Zagros that the Assyrians dubbed *Madāya* (Medes), and one that only latterly developed some kind of unified identity (Rollinger 2003, 2005; Rossi 2010). Iranian-speaking groups with a variety of local dialects probably formed a major group within this conglomerate, which came under Assyrian influence from the ninth century BCE onward (Radner 2003). We do not know exactly when these tribes were united by a commonly accepted leader, but this development appears to have been connected to the demise of the Neo-Assyrian Empire after the death of Assurbanipal in 630 BCE. The same is true for the unification of Babylonia, which was triggered at about the same time (Fuchs 2014). We also do not know how far the power and influence of the newly formed Median confederation reached to the east, but it may have exercised direct control at least as far as the region to the south of the Caspian Sea. The Median center was located in the central Zagros and, for a short time, i.e. between about 630/20 and 550 BCE, it appears to have developed an enormous political force (Rollinger 2010; Rollinger 2020). At any rate, the Babylonian Chronicle, our major source for the political history of this period, makes it clear that the newly formed Neo-Babylonian Empire would not have been capable of destroying the Neo-Assyrian Empire and its capitals without the help of its Median allies (Rollinger 2003: pp. 291–295).

At about the same time another process of secondary state formation took place in an area that had originally been controlled by the Neo-Elamite Empire. Probably around 600 BCE, a new political power emerged in the modern Iranian province of Fārs, which clearly exhibited an Elamite sociopolitical and cultural background, but at the same time involved political agents and elites with Iranian roots (Waters 2000; Henkelman 2008, 2011). The new political entity labeled itself Anshan and very soon developed a desire for

expansion as its Median neighbor to the north had already done (Rollinger 1999). Sometime in the first half of the sixth century BCE, Susiane, modern Khūzistān, became part of this state, and in 550 BCE, the Median confederation was subdued by Cyrus the Great, who presented himself as king of Anshan. Cyrus' success is reported not only in the Babylonian Chronicle but also in an inscription of the Neo-Babylonian king Nabonidus. This is important in its own right for, generally speaking, Ancient Near Eastern royal inscriptions refer to foreign regions only when they are subdued by or come under the direct or indirect control of Mesopotamian rulers. But times had already changed, and the dynamic processes of state formation that occurred on the periphery of the Mesopotamian empires could no longer be ignored (Rollinger 1999).

These processes are not only important as political facts, but are also significant for the history of the Mesopotamian empires. The formation of new states and new elites in the "peripheries" had repercussions for the empires themselves. As already mentioned, elites of this sort arose in contexts that were fundamentally shaped by imperial models, yet at the same time they devised political agendas and concepts of their own. All of this went alongside the emergence of enormous political and military power. The result was not only the destruction of the old empires by forces originating from these "peripheries", but also a takeover of the old empires by the new elites of these regions. Thus discontinuities and continuities were present at the same time. The idea of empire (its general structure and representation) survived, but the new elites set it against new backgrounds. This is true not only for the Median conglomerate and the Neo-Babylonian empire but also for the state of Anshan, which in a very short time developed into the strongest political power in the Ancient Near East. It has already been stressed that we only know a tiny amount about the different stages of its military expansion to the east. But, however much the emergence and structure of this state owed to its close contacts to the Elamite and Babylonian cultures, its astoundingly rapid expansion to the east can only have been possible because of pre-existing and probably transregional political structures. Just as the Median conglomerate, a result of secondary state formation on the fringes of the Neo-Assyrian Empire, finally overran that empire, so the state of Anshan, a product of secondary state formation on the peripheries of Elam and Babylonia, not only eliminated Elam, but eventually subdued the Neo-Babylonian Empire as well in 539 BCE. Once again, then, it was from the "periphery" that a new empire emerged, and this empire was not only powerful enough to take over the old one, but was capable of shaping a new one of unprecedented dimensions. During the reigns of Darius I and Xerxes I this empire was the largest one the world had ever seen. But, of course, it did not cover the entire world, and the principles of secondary state formation of previous times also applied on its fringes. In the

east it was again Iranian tribes that were mostly affected by these developments, in the west, it was the territorial states of Macedonia and Thrace, and then, half a century later, the Athenian Empire and Sparta. Although it is not a common approach in western scholarship, the confrontation of the Persian Empire with Athens, Sparta, and Macedonia can be explained and described as the result of evolving processes of state formation on the “periphery” of an empire. The only difference is that this time our sources mainly originate from the “periphery” and have specific perspectives on the events in question. These subjective and ideologically motivated perspectives have been generalized and become part of the western tradition. But, if we try to leave Hellenocentrism and Eurocentrism aside, we immediately recognize that we are dealing with general political trends and long-term trajectories that are less dependent upon a particular nation or race than on underlying structures. And as Cyrus emerged on the fringes of a world empire, which he eventually conquered, the same applies to Alexander and his conquest of the Achaemenid empire. A new power arose on the “periphery” of an empire that was eventually captured and subdued by that peripheral power. But this proved to be the last successful conquest of an entire empire in Ancient Near Eastern history. With the Parthian Arsacids in the East and Rome in the West new empires did again show up on the peripheries, but neither was now capable of regaining what the Achaemenids had established. They faced each other on the Euphrates and had to share the Achaemenid heritage.

Dynasty and Succession

In this discussion of various continuities and discontinuities between the Neo-Assyrian and the Persian-Achaemenid Empires one point remains to be dealt with, namely the problem of dynasty and succession. The Neo-Assyrian Empire is one of the empires (like those of the Sasanians and Ottomans) that was always ruled by a single family. But there are also empires that display a totally different character in this regard, e.g. the Roman empire. This means that the existence or non-existence of a single dynasty does not in itself reveal much about the stability or instability of these political structures. It is more important to focus on how firmly anchored and accepted the concentration of political power in the hands of one family was and how the state reacted to challenges to this power. The Persian Empire was ruled by two different dynasties, the Teispids and the Achaemenids (Rollinger 1998a, 2014a). But a closer look at political developments immediately reveals that it is appropriate, at least when focusing on the establishment of political power, to conceptualize the formation of the Teispid state within the context of the history of its Neo-Babylonian predecessor. With the Achaemenids, by contrast, a new and

much more successful idea of the state arose. Let us start once more with some remarks on the Neo-Assyrian Empire.

As already stressed, all Neo-Assyrian kings belonged to one single family (Eder and Renger 2004: pp. 18–19). They formed a stable dynasty, and their right to rule appears to have been not only generally accepted but also regarded as a fundamental feature of the empire. But this does not mean that the rule of Neo-Assyrian kings was not challenged. These challenges were various, and they should not automatically be equated with a crisis of the state. Usurpations took place fairly often, but as far as we can tell, it was nearly exclusively members of the royal family who challenged the reigning king or the crown prince's right to become the reigning king (Frahm 2016; Radner 2016). Since Ancient Near Eastern empires did not accept primogeniture, such revolts were not an extraordinary eventuality and they could occur without major turbulences.

The case was different when the murder of the king led to longer civil wars and different factions fought for the throne. This happened when the usurper did not gain immediate acceptance by the elites. In these cases, when conflicts were not limited to the capital and the entire empire was affected for a longer period of time, we can recognize a crisis that might in principle endanger the very existence of the empire. Such times of civil war and inner turbulence were not very frequent. We may identify examples in 826–820 BCE, when the aged Shalmaneser III withdrew from politics and important courtiers started to dominate political affairs, or in 763–746 BCE, when the once powerful courtier Šamšī-ilu gradually lost influence (Fuchs 2008). With Tiglath-pileser III (746–727 BCE) and his son Sargon II (721–705 BCE) crisis of this sort appears to have come to an end, although both were usurpers and there was considerable unrest at the very beginning of their reigns. But, after the murder of Sennacherib in 681 BCE, a major conflict arose about the succession that appears to have affected the entire empire. As often before (and later in the case of Xerxes I), the victor in this civil strife, Esarhaddon (680–668 BCE), was not the eldest son of the former king. And, like Xerxes I, he frankly referred to this fact and sought to legitimize his selection as crown prince and later king by reference to divine will and assistance. What is more, he also reported on the civil war after the death of his father. That, of course, does not reflect a love of historical truth, but the promotion of a particular perspective and agenda, one that was underpinned by continual allusions to divine support of victory and to the sacrilege of opponents who did not accept the divine will (Leichty 2011: pp. 11–15: Esarhaddon I, line i 8 – ii 39). Something similar had already been done by Šamšī-Adad V (Grayson 1996: p. 183: A.0.103.1 i 39–53), who legitimized victory over his brother Aššur-da'in-aplu in 826–820 in the same way. On a structural level, all this is very reminiscent of the civil war after the death of Cambyses in 522 BCE, Darius I's claim to power and legitimacy, and the monument of Bisitun (Rollinger 1998a, 2016).

At least in the cases of Šamšī-Adad V and Darius I we can be fairly sure that it was the usurper who eventually succeeded, while insisting upon the legitimacy of his rule. This legitimacy was dependent upon acceptance, and the people who had to do the accepting were the royal family and the elites of the empire. If there was homogeneity within this latter group, usurpation could not endanger the empire. But these elites had to be convinced, and this was achieved by legitimization strategies and ideological concepts that were announced in public via royal inscriptions, the contents of which were to be disseminated throughout the empire. Esarhaddon made some effort to avoid civil strife in the future. It is possible that he faced a revolt by a non-royal member of the imperial elite, a certain Sāsî, but this attempt at usurpation can only be reconstructed from indirect references in royal letters that hint at harsh measures against elite factions around 670 BCE (Radner 2007). In any case, in an unprecedented act, Esarhaddon sought to ensure the succession to the throne by administering an elaborate loyalty oath to the elites of the whole empire, i.e. the members of the royal court and of the central administration as well as each governor and his staff (Fales 2012; Lauinger 2012). As a result Esarhaddon's younger son Assurbanipal became king of Assyria, whereas the elder one Šamaš-šumu-ukīn was installed as king of Babylon. At the beginning, after Esarhaddon had died, this arrangement appears to have worked fairly well but in the end another war was unavoidable. This confrontation can also be described as a civil war, and it took Assurbanipal four years, from 652 to 648 BCE, to subdue his brother. But since the Assyrian elites appear uniformly to have assisted Assurbanipal and since there was no serious external enemy at this time, the empire as such was not in danger.

The situation dramatically changed with the death of Assurbanipal in 630 BCE. The heir apparent, Aššur-etel-ilāni (630–627 BCE), was a child, and the actual ruler was a powerful courtier, Sîn-šumu-līšir. But he appears not to have been able to gain the general acceptance of the imperial elites. This, at least, is what is implied by the unsuccessful usurpation of a certain Nabû-rehtu-ušur. This loss of community spirit among the imperial elites together with serious external threats sounded the bell for the last round of the Neo-Assyrian Empire. What followed was a combination of external and internal strife that lasted for about 20 years. Sîn-šumu-līšir tried to usurp the throne for himself but was thwarted when Sîn-šar-iškun (627–612 BCE), another son of Assurbanipal, appeared on the scene. Sîn-šar-iškun's primary task was then to save the empire, but unfortunately he had to face two rebellions at the same time, and to suppress both of them was something that exceeded the resources of the empire. One usurpation, that of a certain Itti-ilāni in the west, is only mentioned in passing in our sources. But the rebellion of Nabopolassar in Babylonia is reported in more detail in the Babylonian Chronicle and the king's own inscriptions. When the Medes

showed up as allies of the Babylonians, the resistance of the Assyrian Empire was finally broken and its traditional capitals were devastated, Assur in 614 BCE and Nineveh in 612 BCE. Egyptian intervention allowed the Assyrians to create a temporary refuge around Harran, but, when this city was captured in 609 BCE, the last Neo-Assyrian ruler Aššur-uballiṭ disappeared (Fuchs 2014).

With the successful campaigns of Nabopolassar and his son Nebuchadnezzar II a new empire with new elites and a new center arose. The Egyptians were expelled from Syria and the whole of Mesopotamia was under its firm control. But the sort of stability that had been achieved by the Neo-Assyrian Empire in its heyday could not now be reestablished. This is reflected in the fact that even militarily powerful and effective kings did not succeed in creating a new dynasty. They tried to do so, but they failed, and the dynastic sequence always broke down at the latest in the third generation with the appearance of a successful usurper. This unrest was due to tensions in the Babylonian elite that also became obvious when Nabonidus, the last Neo-Babylonian king, left Babylonia for about 10 years to hold court at Tēma in the Arabian peninsula. The fact that some of the usurpers of this period did not have royal ancestry, and did not even claim to have one, may hint at a certain loss of legitimacy and may have added to the political instability.

Thus, Nebuchadnezzar II installed his under-age son Amēl-Marduk (565–560 BCE) but the latter was eliminated by Nebuchadnezzar's son in law, Neriglissar. The latter's son Lā-abāš-Marduk only reigned for some months, when he again was removed by Nabonidus (556–539 BCE). With Bel-šarru-ušur a crown prince was introduced, but the military defeat against Cyrus once more prevented the establishment of a dynasty. Things did not immediately change with Cyrus. Cyrus appointed his son Cambyses as king of Babylon and some time later as crown prince of the empire (Petschow 1988; Peat 1989; Zawadzki 1996; Joannès 2020), and, after Cyrus' death, Cambyses duly became king in 530 BCE. But when he died, the very short reign of a certain Bardiya, who was probably Cambyses' brother, gave way to a major civil war, and the Teispids were wiped out. After more than a year of harsh fighting that affected the whole empire a new king, Darius I, entered the scene in 522/1 BCE. Soon he too installed a crown prince, and this time a new Achaemenid dynasty was founded that ruled the empire until the death of Darius III in 330 BCE.

Thus it was only with the Achaemenids that a dynasty was successfully reestablished in the manner familiar from Neo-Assyrian times. But the idea of dynastic succession was conceptualized in a new way, a fact that might also reflect an increased need for legitimization. In Neo-Assyrian times dynastic affiliation was expressed in royal inscriptions by multi-part filiations which

might also mention a common ancestor, as when Esarhaddon claimed succession from all Assyrian kings from Adasi onwards. The same approach is seen in king lists that referred to common and age-old ancestry. In the period between the Neo-Assyrians and the Achaemenids, this idea was both entirely given up and yet retained as an aspiration. Nabopolassar radically broke with the previous mode of legitimization and presented himself as “son of a nobody” (Da Riva 2013: p. 57: NaplC12, line 12; 94: NaplC32, line i 8).¹ Neriglissar frankly referred to his non-royal ancestry by naming his father Bēl-šumu-iškun (Da Riva 2013: p. 116: NeglC21, line i 11; 136: NeglC011, line i 11’; 128: NeglC23/7, line i 12; Negl23/1, line 14), and Nabonidus did not hide his non-royal background either (Schaudig 2001, 487f.: 3.1, i 7–9). At the same time in his inscriptions Nebuchadnezzar II again and again expressed his wish for the eternal reign of his progeny (*līpu*) and this idea was adopted by Neriglissar, although in both cases it was, as we know, a pious hope. By contrast, in his famous cylinder inscription Cyrus not only referred to his father and grandfather as kings, but also to a royal ancestor (*līlīpu*), Teispes by name (Finkel 2013: p. 131, line 20–22; Rollinger 2014c: p. 191). This was an obvious return to Assyrian practices, although, in the end, not a successful one. Darius I went one step further by combining old and new in an entirely novel manner. With eight members his line of antecedents was much longer than any previous one, but he only indirectly claimed that all of them had been kings. He also only adduced by name some members of this lineage, but, when he did so in the case of his father or grandfather, they were presented without any royal title (Rollinger 1998a). There was, however, another ancestor who was attributed much more importance than any other previous figure: for Darius did not content himself with just referring to this Achaemenes, but, for the first time in Ancient Near Eastern History, a new term was derived from his name to label the entire lineage “Achaemenid.” Whereas the term “Teispid” is a modern invention, “Achaemenid” is an authentic neologism, coined to convey the idea of a common royal house in new terminology. It was a royal house that prospered for a very long time. Of course, there was also conspiracy and regicide during this period (Dusinberre 2016; Waters 2016; Thomas 2017), but the dynasty was not in danger for almost 200 years. Kings were murdered (Xerxes I in 465, crown prince Darius in 465, Xerxes II in 423, Artaxerxes III in 338, Arses in 338) and there were rebellions in Egypt (Ruzicka 2012) and Babylonia (Rollinger 1998b; Waerzeggers 2003/2004; Henkelman et al. 2011) as well as a short period of civil strife when Artaxerxes II was challenged by his younger brother Cyrus in 401 (Lee 2016), but opposition against the reigning king mainly arose from within the royal lineage itself. In the end, the newly established empire of Darius I remained stable for two centuries.

NOTE

- 1 But since Adasi, founder of Assyrian kingship, is called “son of a nobody” in the Assyrian Kinglist (Waters 1998), one could also interpret Nabopolassar’s self-presentation as an adaptation of an Assyrian concept.

CHAPTER 28

Elamite Traditions

Javier Álvarez-Mon

Introduction: The Elamite Foundations of the Persian Empire

Almost a century ago one of the foremost authorities on Greek and Iranian history M.I. Rostovtzeff (1926: p. 125) suggested: “The Median kingdom was conquered by Cyrus, the fifth king of the Persian tribe, which had probably been long connected with Elam and had inherited from that source its civilization and capacity for political development.” In a similar vein the renowned archeologist and Iranologist W. Hinz (1972: p. 178) stated: “When Elam was incorporated into the Achaemenid Empire in 538, the Persians inherited its art and civilization. For some time before this, they had profited from an Elamite education; they had been countrymen and neighbors on their eastern border since about 695.” The likelihood that the genesis and key characteristics of the Persian Empire should be linked in time and space to the older Elamite civilization presented a model of continuity that, at the time, could not be substantiated by archeological evidence. Additionally, these specialists faced deeply entrenched scholarly attitudes that had prevented the recognition of continuity between Elam and Persia. Particularly influential was the privileging of classical sources – apparently unaware that the land where the Iranian-speaking ancestors of the Persians settled had been home to an ancient civilization – coupled with the belief that the Elamite kingdom ended or was broken up by the Assyrian incursion of 647 BCE. In recent years an

improved understanding of the Neo-Elamite period (c. 1000–525 BCE) has led increasing numbers of scholars to embrace the thesis of continuity between Elamite traditions and Persia. For D.T. Potts (1999: pp. 306–307): “the Achaemenid empire, however ‘Persian’ it may have been, in one sense evolved from the Neo-Elamite social, cultural, linguistic, and perhaps even political milieu.” Indeed, the notion that Elam played a major role in the genesis of the Persian ethnos and the formation of a complex state in Fars has been straightforwardly summarized by M. Liverani (2003: p. 10): “Persia is the heir of Elam, not of Media” (see Álvarez-Mon et al. 2011: p. 8, n. 26). This model of continuity highlights a phenomenon of contact, coexistence, and acculturation between Iranian and Elamite populations that culminated in the “Persian ethno-genesis” (Miroschedji 1985: p. 295). Expressed in simplistic formulaic terms, the scholarly community is invited to consider a new historical paradigm, namely: Elamites + Iranians = Persians. The present analysis does not attempt to offer an exhaustive review of all evidence, related scholarly discussions, and theoretical positions regarding the nature of the “ethno-genesis” phenomenon and possible models of acculturation. Instead, it seeks to offer a synthesis and new insights into aspects of the religious and artistic Elamite legacy of Persia. I will begin by outlining the urban landscape during the seventh and beginning of the sixth centuries BCE, which in many ways provides the historical framework for the ensuing discussions.

Urban Landscape: Textual and Archeological Evidence

The existence of Elam as a major political and cultural entity of the ancient Near East is deeply entrenched in the unique lowland/highland physical setting of the Iranian provinces of Khuzestan and Fars. This setting conditioned the material wealth, cultural resiliency, and longevity of the Elamite civilization. Throughout the centuries, however, its territorial and sociopolitical character underwent significant alterations, forcing reformulation of the identity and the notion of Elam. By the mid-seventh century BCE the inhabitants of southwestern Iran were embedded in landscapes bearing the marks of thousands of years of Elamite civilization defined by a legacy of settlements, agricultural and pastoral economies, communication networks, and natural and artificial religious landmarks. According to Ashurbanipal’s account of his 647 BCE Elamite campaign which reached the eastern boundary of the district of the city of Hunir/Huhnur (next to present-day Ram Hormuz), the lowland included no fewer than 14 royal residencies, 12 districts, and countless small towns. The highlight of his campaign was the infamous looting and devastation of Susa. In 626 BCE the Babylonian king Nabopolassar mentions returning

“the gods of Susa,” implying the existence of a political authority at Susa and the restoration of its shrines. A half-century later, the Acropole texts (c. 575–525 BCE) indicate Susa had reemerged as the hub of a commercial and administrative network linking the Elamite palace with towns and groups of peoples located broadly in the present-day Khuzestan province. About 50 years later, the Persepolis tablets (509–493 BCE) reveal the existence of 20 supply stations located in towns and villages along the Royal Road in territories formerly associated with eastern Elam. These tablets outline a regional economic system that was managed from Persepolis and stretched west to east from Behbahan (or perhaps Ram Hormuz) to Niriz, i.e. a larger part of modern Fars.

Despite textual evidence for networks of settlement and centralized administration during the years 647 BCE, c. 550 BCE, and 500 BCE, precise locations for the many toponyms mentioned in the texts remain wanting (e.g. the Neo-Elamite royal cities of Madaktu and Hidalu) and those towns whose location seems to be secure (such as the old city of Huhnur, Tol-e Bormi near Ram Hormuz) have yet to be properly excavated. The Neo-Elamite period is scantily represented in the archeological record of Susa and, so far, excavations at Anšan (Tall-e Malyan) have failed to unveil any seventh and sixth century BCE remains. Lowland Susa (c. 80 m above sea level) is a typical Near Eastern multilayered tell reaching 38 m high and follows vernacular agglutinative “urban planning” principles. In comparison, highland Anšan (c. 1600 m above sea level) is a heavily eroded tell (the highest ground reaching 8–10 m) marked by a massive mudbrick wall enclosing more than 200 ha of land. The former eastern Elamite capital of Anšan is mentioned in the Assyrian Annals as a key participant in the Elamite-led coalition against Sennacherib in 691 BCE. It also played a prominent role as the nominal ancestral kingdom of Cyrus the Great and his forebears, and, judging by the Persepolis tablets, was inhabited at the time of Darius.

The above summary highlights the gap between textual and archeological evidence regarding the settlement composition of late Elam and early Persia during the seventh and sixth centuries BCE. Textual evidence from Susa (c. 550 BCE) and Persepolis (500 BCE) outlines the presence of administrative networks composed of towns and villages and institutional and economic centers. Conversely, the absence of occupation at Anšan (and Fars generally) from c. 900 BCE has been interpreted as reflecting a phenomenon of deurbanization instigated by the increasing influence of Iranian-speaking populations engaged in a pastoral nomadic way of life. It is apparent that additional survey and archeological work is required in order to reconcile this evidence. As it stands, we have to grapple with two, not incompatible, socioeconomic realities – sedentary and pastoral – while bearing in mind that the existence at this time (or earlier) of *nomadic* pastoral communities cannot be demonstrated (Potts 2010a).

Religious Heritage: Divinities, Highland Ceremonies, and Funerary Practices

Recent examinations of the Persepolis Fortification Archive by W.F.M. Henkelman demonstrate a richer and more complex landscape of Persian religion than previously envisaged. Underpinning these investigations is the notion that Elam contributed significantly to the ideological and practical infrastructure from which core Persian religious beliefs and practices emerged. Persian religion at the time of Darius is presently conceived to exhibit religious acculturation, in the words of Henkelman (2008: p. 59): “the heterogeneous unity of religious beliefs and cultic practices that emerged from long Elamite-Iranian coexistence and were considered as native by the inhabitants of Achaemenid Fars and its rulers.”

Elamite royal inscriptions illustrate the diverse personality and remarkable continuity of Elamite religion, which was dominated by divinities from the lowlands (Suso-Mesopotamian gods) and the highlands and plateau (sometimes called Anšanite gods). The early Persian religious pantheon as represented in the Persepolis Archive incorporated deities of Suso-Mesopotamian background (such as Adad and Nabu) and deities of Elamite “Anšanite” pedigree (such as Humban and Napiriša) with deities of Iranian origin (such as Ahura Mazda). The longevity of the god Humban is particularly exceptional. He joined the Elamite pantheon as a deity of highland-Awanite background attested in the treaty of Naram-Sin (2260–2223 BCE) and, judging by his prevalence in royal onomastics, was one of the most important Neo-Elamite gods. He is by far the most conspicuous god in the Archive and, like the lowland great god of Susa, Inšušinak, had the function of bestowing kingship (*kiten*) upon the ruler. In this regard, it has been proposed that Humban provides an important theological template for Ahura Mazda as king maker.

Within the Archive there are references to state-supported ritual offerings, which in terms of frequency and quantity of foodstuffs allocated appear to have occurred predominantly in the context of a ceremony known as *lan*, followed far behind by *šip*, *bašur*, and *šumar*. The most important ritual involving the king (or a representative) was a sacrificial communal banquet known by the Elamite term *šip*. It was enacted in fall and entailed the sacrifice and consumption of large numbers of slaughtered cattle and sheep/goats. Striking visual evidence of a ceremony that could be identified as *šip* is exhibited on Neo-Elamite monumental relief panels situated in the highland valley of Izeh/Malamir, which lies c. 850m above sea level and links the gateway urban center of Huhnur with the plateau.

Kul-e Farah is a ravine nested on the eastern side of the valley, marked by a seasonal creek bed and six Neo-Elamite bas-reliefs carved over the cliff face (KF I, IV, and V) and boulder faces (KF II, III, and VI). The most significant

reliefs in terms of the present discussion are the monumental KF IV, KF III, and relief KF I. Kul-e Farah IV (c. ninth to eighth centuries BCE) is a c. 18×6m composition exhibiting a communal feast presided over by a seated king surrounded by more than 140 standing participants partaking in the ritual consumption of a morsel of food, probably meat. Amongst the participants are rows of individuals wearing long or short garments, an orchestra, and bow-bearers. Most have a distinctive long, braided hairstyle. Kul-e Farah III (c. eighth to seventh centuries BCE) represents a procession with about 200 participants accompanied by flocks of rams and zebu. Heading the procession are four kneeling males with head caps supporting a large platform on which stands a large male figure (representing perhaps a king or a deity). Kul-e Farah I (c. seventh to sixth century BCE) depicts a large-scale individual identified by an inscription as Hanni, “prince” or “chief” (*kutur*) of Aiapir and vassal of the Elamite king Šutur-Nahhunte son of Indada, and two court officials (a weapon bearer labeled “Šutruru, the Master of the Palace” and a long-garment bearer). They face a trio of musicians as a zebu is butchered next to ram carcasses and a fire altar or censer (Álvarez-Mon 2013).

These highland ceremonies are intimately connected to the notion of place and natural landscape (Kul-e Farah and the Izeh/Malamir valley), group identity defined by distinctive physical features (most particularly, long braided hair), social structure, and prescribed order (hierarchical displays organized along registers), and custom and ritual (animal sacrifice, a communal meal, religious worship, and an altar or censer). All together: place, self-representation, hierarchy, communal ritual, and worship provide a nexus of identity markers defining a population, religious attributes, and sociopolitical ideology. Furthermore, the Neo-Elamite reliefs of Kul-e Farah offer significant artistic blueprints for Persian palatial and funerary sculptural arts (Álvarez-Mon 2019).

Of five places mentioned in the translated texts from the Persepolis Archive as locations hosting the Persian *šip* feast, three included royal plantations (*partetaš*). The better known is Pasargadae/Batrakataš, which also hosted *lan* sacrifices and *šumar* funerary sacrifices enacted at the tomb of Cyrus. The documented association of a (royal) tomb garden/plantation with the burials of Cyrus (at Pasargadae), Cambyzes (at Narezzaš/Niriz), and other members of the Persian nobility (e.g. at Dasht-e Gohar and probably at Buzpar) is echoed in Assyrian texts and Neo-Elamite archeological evidence. According to Assyrian accounts of the 647 BCE desecration of the royal Elamite burials from Susa by Ashurbanipal’s troops, the Elamite kings were buried in “sacred groves” (*busa*) situated in the religious heart of the city next to the Ziggurat and associated temples. Judging by the archeological evidence unearthed in the course of excavations at Susa by R. de Mecquenem and P. de Miroschedji, the *busa* may have included mudbrick vaulted funerary chambers, typical of the lowlands.

In contrast to the Elamite burials from Susa, the recently discovered elite burials from Arjan and Ram Hormuz (c. 600–550 BCE) are found in piedmont gateway areas linking the highlands with the lowlands. The Arjan tomb was located on the left bank of the Marun River and the Ram Hormuz burial on the left bank of the Ala River (the remains of Tol-e Bormi/ancient Huhnur are on the right bank). Both burials are rectangular chambers with stone-lined walls, and both contained bathtub-style bronze coffins and exceptionally luxurious grave goods.

It may be premature to further stress the significance of the differences between the lowland/mudbrick/urban setting of Susa's burials versus the piedmont/stone/riverside (apparently) isolated burials of Arjan and Ram Hormuz. At the same time, the burials from Arjan and Ram Hormuz offer a new captivating view of Neo-Elamite funerary traditions attested in piedmont areas (Wicks 2015, 2017). Both elite lowland and piedmont funerary traditions reveal continuity with the two elite burials containing bronze coffins excavated at Susa by J. de Morgan. The most prominent was unearthed in the former Elamite sacred quarter of the Susa Acropole and included a coffin (probably deposited inside a mudbrick chamber) containing precious jewelry with close parallels in the Ram Hormuz burial. The skeletal remains (and associated jewelry), presently dated to the fifth century BCE, were interpreted as belonging to a "Persian princess" (Wicks et al. 2018).

Artistic Heritage (i): Mudbrick Architecture and Vitreous Industries

A widespread opinion, largely based upon interpretation of comments made by Herodotus, asserts that the Persians were tribal (pastoralist nomadic) peoples whose culture lacked a tradition of monumental and sculptural arts. A redefinition of "the Persians" as peoples with a shared Elamite and Iranian heritage raises questions over the validity of this creed. In concrete terms it suggests that Persian monumental architecture was informed by *both* Elamite and Iranian traditions. Evidence of continuity between Elamite architecture and related decorative arts and those of the Persian palaces of Susa and Persepolis is observable in one of the main signatures of Persian art: the so-called Apadana or hypostyle hall.

Two different but complementary architectural traditions converge in this monumental building: one conversant with the use of mudbrick, the other with the use of (wooden and stone) columns. Appreciation of the crucial role that mudbrick played in the building of the Persian Apadana and related monumental architecture has been impeded by emphasis on the solid, visible parts of the archeological record. Indeed, earlier archeologists at Persepolis

struggled to determine whether the Persian Apadana had any walls; some reconstructed the palace as an openly exposed forest of columns, while others interpreted the interruption of the floor tiles as evidence that the hypostyle halls were hidden from the outside world by mudbrick walls. Revelation of the fundamental role and characteristics of the massive mudbrick walls enclosing the columned halls and the defensive mudbrick walls of Persepolis came about with the excavations by E. Schmidt (1934–1939) and careful studies and reconstruction by F. Krefter. It is at Susa, however, that parallels with Elamite mudbrick architecture and decorative arts can be best established; keeping in mind that these are not the only references and that outstanding mastery of mudbrick architecture and associated (wooden) columned halls is evident in the “Median” heartland at Tepe Nush-e Jan.

We still lack knowledge of almost every aspect of the layout of Elamite palaces. Despite this absence, archeological evidence from the Old Elamite (c. 1900–1500 BCE) monumental villa compounds in the Ville Royale (Chantier A, levels XV–XII) at Susa suggests that a central planning principle, which determined Elamite (monumental) secular architecture, was the association of an open courtyard with a long, rectangular, “reception” hall comprising the heart of the living quarters. The unity of this domestic layout takes a further conventional dimension at Elamite Susa with the addition of two pairs of pilasters positioned close to each end of the “reception” hall (*salle-aux-saillants*). The exact function of these pilasters is debated but in all probability they marked the end piers of a vaulted ceiling (which, judging by the thickness of the mudbrick walls forming the hall, might have supported a second floor).

Excluding the Apadana hall, the Persian palace of Darius at Susa follows traditional Elamite and Mesopotamian architectural layout. It is a mudbrick-built monumental complex organized around three main courtyards. The ceremonial and private living quarters ordered axially along the “western” courtyard (C1 or *court d'honneur*) retained palpable evidence of the “pilaster-hall plus courtyard” tradition. The most noteworthy examples are two consecutive massive pilaster halls (rooms 752 and 753) linking the courtyard to the “throne hall” (or royal chamber). In addition, situated along the southern wing of the palace is a sequence of five (?) compounds of living quarters organized along pilaster halls and open courtyards (e.g. room 1414). Finally, a sequence of two consecutive pilaster halls (rooms 358 and 357) connect the central courtyard with the Apadana (Ladiray 2010: pp. 208–221).

A similar planning principle is attested on a smaller scale at Persepolis in living quarters thought to have housed palace guards and artisans. This compound (E Complex) is situated to the east of the Treasury (between a 6 m wide avenue and the defensive mudbrick city wall). The partially excavated mudbrick buildings here include a “pilaster hall plus courtyard” (room 9; Schmidt 1953: p. 201, fig. 84). Finally, to the northeast (east of the “unfinished

gate”) there are two consecutive perpendicular monumental pilaster halls (it is uncertain whether they may originally have opened into courtyards). Several scholars have supported the opinion that Darius’ architects borrowed the monumental “pilaster hall plus courtyard” tradition from the late Neo-Babylonian palaces built by Nebuchadnezzar II (604–562 BCE; the *Südburg*, courts D and E; the *Hauptburg*, and the *Sommerpalast*); current reassessment of the archeological evidence, however, suggests they were additions made to the Babylonian palaces by the Persian kings (Gasche 2010).

A further characteristic of mudbrick architecture exhibiting Elamite influence is the addition of royal inscriptions on an undetermined number of mudbricks, glazed bricks, and tiles found in the palace of Darius at Susa. These inscriptions are formulaic in nature: most include Darius’ “signature” (name, titles, and his father’s name); some are more elaborated and state his piety and the special support of Ahura Mazda (DSI); and a few contain a remarkable statement which could refer to esthetic properties of the palace “*may it seem splendid to everyone* (who sees it)” (DSa). The original placement of these inscriptions is unknown. That some were on glazed bricks and tiles suggests they were probably exposed on visible sections of the palace’s walls (Lecoq 1997).

These inscriptions recall a well-attested Elamite tradition of (glazed and unglazed) mudbricks inscribed with royal building dedications to Elamite divinities (Malbran-Labat 1995; Potts 2010b). The most outstanding examples belong to series of baked bricks from Tchoga Zanbil by Untaş Napiriša (1340–1330 BCE) and from Susa by Šutruk Nahhunte I (1190–1150 BCE). In the holy city of Tchoga Zanbil a repetition of 662 hand-inscribed mudbricks was exhibited along the facade wall forming the base of the ziggurat. A unique example from Susa by Šutruk Nahhunte (inscription EKI 18) refers to the construction of the *hiyan/ian*, a monumental building dedicated to Inšušinak which incorporated a columned hall or portico (Vallat 1999). Indeed, numerous mudbrick column bases were found in the course of excavations conducted in the Susa Acropole, although no further information exists about their arrangement. The inscribed mudbricks from the palace of Darius at Susa reflect the adaptation of an Elamite “writing on the wall” tradition advertising the king’s agency and religious duty as *roi bâtisseur*. Both temple and palace mudbrick inscriptions convey an expression of royal agency materializing in the form of a wondrous monumental building.

Since the 1946 publications by H. Frankfort and G. Richter (see references), the trilingual foundation inscriptions left by Darius at Susa – of which we have three versions (DSf, DSz, and DSaa) – have been presented as evidence of the foreign contribution to Persian art. These inscriptions provide accounts of the workers from different satrapies participating in the construction of the palace. Varying interpretations of the “foundation chart” inscription DSf have

resulted in nuanced approaches regarding the extent to which these workers ought to be considered artists (in the sense of generating artistic blueprints otherwise absent from Persian tradition), artisans (in the sense of skilled labor), or general labor force. It is becoming increasingly apparent that the massive enterprise required for the building of Susa and Persepolis (and other Persian palaces) needs to be placed in the context of a Near Eastern literary tradition of royal building (and related royal inscriptions) together with the employment of a multiethnic (skilled and unskilled) *corvée* labor force for the menial tasks of state-supported projects as attested in texts from Babylon and Persepolis (Uchitel 1991; Henkelman and Kleber 2007).

The decorative program of the palace of Darius at Susa, and to a minor degree at Persepolis, was almost entirely dominated by the industry of molded mudbrick, and monochrome or polychrome siliceous bricks (using a mixture of sand and lime or chalk) assembled to form large compositional frieze reliefs. It has been estimated that only c. 13 000 – representing about 10% of the total bricks decorating the palace walls of Susa – were recovered. Articulated already in 1891 by M. Dieulafoy, recent scientific analysis has confirmed the colossal endeavor of a project requiring sophisticated levels of technology, specialized labor force, and great expenditure (Daucé 2010). Some of the imagery exhibited in the brick panels from Susa is replicated in stone at Persepolis, suggesting a cohesive monumental visual program which, in many ways, continued a well-established tradition in terms of expertise, materials, and iconography.

Siliceous (glazed or unglazed) bricks are a signature of Elamite art attested since the time of Šutruk Nahhunte I (1190–1150 BCE). This type of brick was also employed at Persepolis and, most startlingly, at Achaemenid Babylon where previously the bricks had been made of terracotta. Faience industry during the Neo-Elamite period is also characterized by wall panels with imagery made with a black outline glaze (used to delineate the contour of the design) and compartmentalized colored glaze. Persian siliceous brick panels use a similar technique, which has been compared to “*cloisonné*,” where the contours in relief were delineated with a dark, raised glaze forming compartmentalized spaces filled with colored glaze (Álvarez-Mon 2010).

Artistic Heritage (ii): New Discoveries

In Álvarez-Mon (2010) devoted to the analysis and interpretation of the artifacts found in 1982 inside the Arjan tomb, I noted artistic parallels between Neo-Assyrian and Neo-Elamite art. These correspondences were interpreted as the result of emulation of Assyrian elite art and its adaptation into Elamite artistic format and tastes. The sociopolitical context that fostered such a phenomenon of interaction is characterized by a sequence of events related to the

peace treaty between the Assyrian king Esarhaddon and the Elamite king Urtak in c. 674 BCE, the exile of the House of Urtak in Assyria (664–653 BCE), and the post-647 BCE destruction of Susa. Consequently, I proposed the existence of a period of Assyrian artistic (and political?) influence in western Elam which lasted until about 626 BCE.

The Arjan material has assumed further significance following the chance discovery in April 2007 of the Ram Hormuz burial, which enclosed two fragmentary “bathtub”-style bronze coffins occupied by the skeletal remains of females. The coffins held a sumptuous array of gold jewelry, including bracelets (some with animal terminals), pins (analogous to those found at Susa), pendants, rings, beads, and more than a thousand assorted bracteates. The bronze metalwork is represented by chalice-style vessels (identical to those found at Susa and Arjan), inkwell-style vessels, and five candelabras (one with three duck-head feet supporting a trio of elongated leaping bulls holding the central shaft of the candelabrum). Equally original are a small bronze figure of a lady balancing a vessel on her head and long-handled bronze and silver pans mounted with “mermaid” ladies with long fish tails, sophisticated hair-styles, bracelets, and flounced skirts. The burials also contained glazed vessels and ceramics, including large amphorae clearly associated with the Neo-Elamite II period assemblages encountered at Susa (Álvarez-Mon 2010).

Based on striking correspondences with objects found at Susa and Arjan, the Ram Hormuz burials ought to be dated to c. 600–550 BCE (or based on related inscriptions, perhaps as low as 539 BCE). Both Arjan and Ram Hormuz introduce a new chapter in our understanding of the genesis of Persian art. The luxurious characteristics of the materials together with the inscriptions advocate elite, if not royal, status for their occupants. The materials bridge the last manifestation of Elamite tradition (incorporating the legacy of Assyrian elite art) with key recognizable features of Persian art. This phenomenon can be readily observed in, for example, the tribute scene exhibited in the Arjan bowl (which links the Assyrian tribute scene with the tribute procession from Persepolis), the *couchant* bulls in the Arjan stand candelabrum (which perpetuate Elamite tradition and provide a prototype for the Persian Apadana bull capitals), the stylized representation of lion heads from the Arjan beaker and stand candelabrum (which also share analogies with Persian lion heads in both monumental and portable art), and the bracelets with animal terminals decorated with granulation from Ram Hormuz (similar to those found in the “Persian princess” burial at Susa). A prominent iconographic element of continuity is the lion-headed griffin, which features on the Arjan “ring” and later plays a privileged role in monumental architectural relief sculpture of the Achaemenid Empire. Far from being the manifestation of abrupt change or of a disintegrating culture, this artistic production suggests the revitalization of Elamite traditions in the late seventh and sixth centuries BCE and a historical nexus where the process of transference and continuity can actually be documented.

Concluding Remarks: The Legacy of Elam

If, as stated by many commentators, Fars became home to Iranian-speaking populations as early as c. 1000 BCE (or earlier), Elamite-Iranian acculturation may have lasted for many centuries and taken multiple forms. Salient political and social forces were at work during the first half of the millennium. Amongst the most relevant: an increasing presence of populations bearing Iranian names; the wars and peace treaty between Assyria and Elam; the looting and devastation of Susa and much of western Elam in 647 BCE; the Elamite “renaissance” period (c. 626–520 BCE); and the collapse of the Assyrian Empire in 612 BCE. These and other phenomena undoubtedly conditioned the stage on which cultural differences and similarities were negotiated, manipulated, emphasized, or suppressed, according to individual as well as group interests.

Much remains uncertain, but it is possible that after 694 BCE the city of Anšan, relatively sheltered from the upheavals of the west, enjoyed a substantial degree of political sovereignty which became cemented under the leadership of the House of Teispes: Cyrus the Great, “son of Cambyses, king of Anšan, grandson of Cyrus (Elamite Kuraš/-uš), king of Anšan, great-grandson of Teispes, king of Anšan” (Babylonian Cylinder, Lecoq 1997: p. 183, 7). Indeed, judging by the presence of Elamite and Iranian names amongst Cyrus the Great’s eminent ancestors, and the evidence for continuity witnessed in specific aspects of the Elamite religious and artistic heritage of Persia, it is tempting to believe that a shared Elamo-Iranian consciousness provided the fundamental building blocks for the genesis of the Persian Empire. The enormity of this proposition, the nature of the acculturation process, and the channels of religious and artistic transmission, however, are only beginning to be recognized and articulated, and, of necessity, are destined to be subject to careful scrutiny by the scholarly community.

CHAPTER 29

The Great Conquests

Amélie Kuhrt

In the space of less than 30 years, between 550 and 522 BCE, Cyrus II and Cambyses II conquered a territory stretching from Central Asia to Egypt and the Aegean. With the exception of the Indus Valley (under Darius I in the 510s) and the short-lived extension of Persia power into the Balkans (c. 513–470s BCE), there were no later additions; nor (with the temporary exception of Egypt between 400 and 343 BCE) was control of the conquests lost until Alexander's invasion (334–323 BCE). How it was possible for the still tiny kingdom of Persia to command the military resources to achieve such rapid expansion remains unknown. In what follows, the sources available for tracing events will be considered first, followed by a brief sketch of the main events and a consideration of how the kings attempted to consolidate control in the newly acquired lands.

The Evidence

The major pieces of evidence available for reconstructing the history of Cyrus' and Cambyses' conquests are diverse and unevenly distributed in time and space. Of prime importance for Cyrus' chronology is a Babylonian chronicle ("Nabonidus Chronicle," Grayson 2000: no. 7; Glassner 2004: no. 26), compiled on the basis of neutral contemporary observations. It provides dates for his defeat of the Medes (550 BCE) and Babylonia (539 BCE); despite a general assumption, it does *not* provide a date for Cyrus' conquest of Lydia

(Cargill 1977; Rollinger 2008). There is also material to illustrate how the Babylonians accommodated themselves to their new ruler: most important is a foundation document from Babylon known as the Cyrus Cylinder, a paeon in praise of Cyrus (“Persian Verse Account”), and bricks from Uruk and Ur stamped with Cyrus’ name and title (Kuhrt 2007, ch. 3: nos. 21–23, with references; Finkel 2013). The exceptionally rich corpus of Babylonian documents allows insights into administrative structures, as well as showing that Cyrus died in August 530; the documents also permit us to trace developments in the region under Cambyses.

The bulk of approximately contemporary evidence for Cambyses comes from Egypt. Most important is the inscribed statue of Udjahorresnet, who moved from serving the Egyptian rulers to acting for the new Persian kings, a stele recording Cambyses’ orders for the burial of the sacred Apis bull, an inscribed sarcophagus for him, and an office seal (Posener 1936, nos. 1–4; Hodjache and Berlev 1977; see now Wasmuth 2020). A demotic ordinance (Spiegelberg 1914), preserved in a document from the Ptolemaic period, provides information on adjustments to temple incomes ordered by Cambyses, which were added to a digest of earlier laws drawn up under Darius I (Agut-Labordère 2009–2010). The date of his death, according to the Babylonian material, falls in or soon after April 522.

To this must be added later traditions contained in the Old Testament (Isaiah 40–55; Ezra, echoed in Josephus, *Antiquities* XI.1–18), a Babylonian historian (Berossus FGrH 680 F10a), a Babylonian pseudo-prophecy (Grayson 1975: pp. 24–37; Van der Spek 2003: pp. 420–424), and classical writers such as Herodotus, Ctesias’ *Persica* (FGrH 688 F1–44), Xenophon’s *Cyropaedia*, as well as the lyric poet Bacchylides (Maehler 1982/1997 F3). As the founder of the empire, there are many stories about Cyrus which paint a largely (although not totally) positive picture of his behavior. As his successor, whose reign ended in some turmoil (DB §11), later traditions about Cambyses are fewer and mostly hostile. In order to trace events, historians are forced to rely heavily on a critical evaluation of this later literary material, as the generally more dispassionate contemporary sources do not usually present a historical narrative.

History of Events

According to the most trustworthy information (Nabonidus Chronicle), the Median king Astyages attacked Cyrus of Persia (Anshan) in 550 BCE “for conquest.” However, his soldiers revolted, took him prisoner, and handed him over to Cyrus, who marched to the Median capital of Ecbatana and emptied it of its treasures. The bare bones of this account tally in outline with the

elaborate story of the Median king's treachery and despotism in Herodotus. Both he and Ctesias present the Medo-Persian conflict as a long drawn-out rebellion led by Cyrus against his Median overlord. That the confrontation is likely to have been longer than the concise chronicle entry conveys is indicated by an inscription from Sippar where the Babylonian king Nabonidus (Kuhrt 2007, ch. 3: no. 6, with references) seems to refer to a struggle between Persians and Medes already in 553. Although it has been usual to accept Herodotus' and Ctesias' image of Median overlordship of Persia, this is nowhere borne out by contemporary evidence (Rollinger 2010: pp. 77–81). It is, indeed, contradicted by the Cyrus Cylinder, where Cyrus states categorically that he is the fourth "great king, king of Anshan" in a direct line of descent. The classical stories of Cyrus' rise to kingship are echoes of the later legends woven around him, at home and abroad, as the heroic founder of empire (Kuhrt 2003). A variety of tales are told about Astyages' subsequent fate: All agree that Cyrus was intent on treating him generously, only the treachery of a eunuch brought about his death. The one divergent voice is Xenophon, in whose romantic portrayal of Cyrus, Astyages is his fond grandfather, not his adversary, and Cyrus receives the Median lands as his wife's dowry.

As the extent of the territory the Medes controlled is disputed, we do not know what exactly Cyrus gained by his victory, but the perception of later classical writers was that it led to a confrontation between the Persian king and Croesus of Lydia, with the latter cast as the foolhardy aggressor. Having breached the Halys river, seen as the frontier between Medes and Lydians, an inconclusive battle was fought at Pteria in Cappadocia, in the wake of which Croesus withdrew to his capital at Sardis and called on his allies (Egypt, Babylonia, and Sparta) to come to his aid. Cyrus is said to have taken advantage of this delay, pursuing Croesus and laying successful siege to the city. After its fall, Cyrus is presented as trying unsuccessfully to execute Croesus but forced to spare him ultimately and treating him well. Arrangements for consolidating the conquest included the appointment of a Persian governor, as well as a local Lydian in charge of finance (who rebelled), and appointing commanders to subjugate the coastal regions, which was achieved with extreme brutality. The picture of Cyrus merely responding to unprovoked aggression should be taken with a pinch of salt: Before the battle against Croesus, he attempted to foment revolt amongst the coastal centers subject to Lydia. In Ctesias' account, Cyrus brought along Scythian allies from Central Asia, which suggests considerable preparation. Against the image of Cyrus' kind treatment of Croesus must be set reports of his initial plan to burn him (shown on an early fifth century BCE Attic vase), the execution of his son, Bacchylides' poem which may suggest that Croesus and his family did not survive, and the extreme measures deployed by his commanders to consolidate control.

Unfortunately, the chronology of the Lydian campaign is uncertain, and the classical writers present the sequence of events variously. In the absence of certainty, scholars have usually followed Herodotus' scheme in placing the Lydian campaign before Cyrus' attack on Babylonia, but this may mask more complex realities. There are hints in some fragmentary lines of the Nabonidus Chronicle that the Persian conquest of Babylonia in 539 BCE was preceded by clashes and growing tension between the two sides (von Voigtlander 1963: pp. 194–195). The last preserved lines of the chronicle, combined with a Babylonian document (Strassmaier 1890, *Cyr.* 10), allow the following reconstruction of Babylon's fall. In October 539 BCE, the Persian army advanced on the country along the Diyala route as far as Opis on the Tigris, where they were met by Nabonidus and his troops, who were defeated in battle. After capturing the city and putting many of its inhabitants to the sword, Cyrus moved to the Euphrates, where he took Sippar (October 10th). Nabonidus and his forces fell back to the plain north of Babylon, in order to defend the city. Cyrus dispatched a small contingent under his commander Ug/Gubaru to attack Babylon. Heavy fighting took place around the Enlil Gate which gave access to the city from the north, indicated by the substantial damage it suffered (Tolini 2005). The Persians succeeded in entering (October 12th), captured Nabonidus, who had tried to return, and Gubaru disposed heavily armed guards to protect the city against insurgents. With relative peace established, Cyrus formally entered Babylon on October 29th, was invested as king (Kessler 2002), and ceremonially greeted the inhabitants. Gubaru was appointed governor but died a few days later. In the course of the New Year Festival (March–April 538 BCE), Cambyses was temporarily installed as Babylonian king under the supervision of his father. The arrangement lasted no longer than one year and is thought to have been little more than an interim solution during Cyrus' absence. Overall control of the country remained for the next few years in the hands of Nabu-ahhe-bullit, governor (*šakin māti*) under Nabonidus.

In 535 BCE, another Gubaru was appointed governor with quasi-royal powers and extensive staff of the newly-created province of "Babylon and Beyond-the-River (area west of the Euphrates)," a post he retained until 525 BCE (Tolini 2011: pp. 26–29). While it is usual to stress the continuities in Babylonian administration, society, and cult, recent work draws attention to the rapid refocusing of routes and royal ceremonies on Iran, to drive home the point that this is where the center of the empire now lay (Tolini 2011: ch. 1). The fate of the defeated Babylonian king, according to later writers (pseudo-prophecy, Berossus), was to receive the income of an estate enabling him to live at the Persian court (Briant 1985).

Least known of Cyrus' actions is his campaigning in the east, beyond western Iran. The problem again is our lack of knowledge of the territory

controlled, or claimed, by the Medes, and the absence of solid documentation. Both Herodotus and Ctesias associate Cyrus' death with battles against nomadic groups in the northern part of Central Asia – Massagetae, according to Herodotus, Derbicae in Ctesias. The former uses the setting to make a didactic point about the limits of ambition and empire, while in the latter it forms part of a heroic tale. Getting beyond this to any certainties is virtually impossible. What is clear is that in 522/1 BCE the whole of central and eastern Iran, Afghanistan, and parts of Turkmenistan were under Persian control, with governors in position. No stories associate Cambyses with campaigning in the east, which suggests that the region's administration had been set up under Cyrus.

The lightning speed of Cyrus' campaigns, criss-crossing thousands of kilometers in 20 years, meant that many areas were barely touched. We hear nothing of the mountainous regions of Armenia and Cappadocia, for example (see Rollinger 2008, for a suggestion). While the Cyrus Cylinder refers rhetorically to homage received from Babylonia's provincial subjects, it is unlikely that Cyrus' conquest of Babylonia was immediately followed by the surrender of all the regions that had been provinces of the Neo-Babylonian Empire. But the sources available reveal nothing about any Persian action in the extensive regions to the north and west of Babylonia. Despite the Jewish tradition, crediting Cyrus with permission to resettle Jerusalem and build its temple, the precise chronology of that event is so uncertain that it cannot be used to connect it with Persian actions to consolidate control in the Levant (Briant 2002: pp. 44–49). Moreover, at the time of Darius I's seizure of the throne (522–521 BCE), there is good reason to suppose that parts of Elam remained to be incorporated into the empire (Waters 2000: pp. 85–87).

For reconstructing the invasion of Egypt, the one remaining major state, we are virtually entirely dependent on Herodotus (Ctesias' account is generally too distorted for use, Lenfant 2004: LXX, n. 268). Cyrus' successor, Cambyses, inherited an immense territory, only very recently acquired, so that Persian power was fragile. It was essential to act swiftly and decisively in order to retain control. The coastal regions of the Levant and Aegean, in particular, were vulnerable. Egypt's king, Amasis (570–526 BCE), was allied with Polycrates, the ambitious tyrant of the island of Samos close to the Anatolian coast (Carty 2015), and the Egyptian ruler had strengthened his naval power by the conquest of Cyprus, possibly soon after Cyrus' conquest of the Babylonian Empire (Wallinga 1993). In this situation, it was imperative for the Persians to ensure they controlled the seaboard and create a naval force before trying to bring Egypt to heel.

Polycrates seems to have found himself in a precarious position quite early in Cambyses' reign: relations with Egypt broke down and the Persian authorities in western Turkey were on their guard against him. He tried to protect

himself by sending ships to swell Persia's naval forces, but was nevertheless eventually executed by Oroites, satrap of Lydia. Herodotus' many references to Samian opposition to Polycrates' rule suggest that the Persian governor exploited such internal dissensions to bring about Polycrates' downfall and so root Achaemenid power more firmly along the western coastline.

At what point the Phoenician cities, followed by Cyprus, with their large fleets surrendered to Persia is uncertain. But one result was that in the wake of the collapse of the Samian alliance, it left Egypt isolated and seriously reduced its naval strength in the east Mediterranean, while the Persians were able to develop their own navy for the move against Egypt (Wallinga 1993). Simultaneously, they made use of strategic information provided by Egyptian deserters and negotiated an agreement with the Arabs, which was crucial to the logistics (water supplies and routes) of getting an army across the Sinai desert (Eph'al 1982). Amasis' death a few months before the invasion also worked to their advantage. His successor, Psammetichus III, was still trying to establish a firm hold on the throne, which his father had usurped, when he had to face the Persian invasion.¹

For the Persian conquest of Egypt, Herodotus provides a basic, not at all improbable framework, into which he has woven a series of moralizing stories. If these are set aside (Lloyd 1988), then it is possible to disengage a fairly convincing course for events: the Persians defeated the Egyptian army at Pelusium in the Eastern Delta; the successful Persian siege of Memphis was followed by the surrender of Cyrene and Barca in Libya, as their fortunes were closely linked with those of Egypt; Cambyses then initiated campaigns to the south (the Nubian kingdom) and west (Siwa oasis) in order to consolidate the Persian hold on Egypt's frontiers, moves that mirror the policies of his Saite predecessors. According to Herodotus, both campaigns were disasters. But two later writers (Diodorus and Strabo) and archeological evidence (Heidorn 1991) suggest that the moves to impose Persian control along Egypt's borders and establish control of essential routes in these areas were broadly successful.

The only Egyptian document that refers to Cambyses' conquest is the statue commemorating the life of Udjahorresnet, who had been an official in the regime of Amasis and Psammetichus III. There are oblique hints to the disruption caused by the Persian conquest, suggesting that members of the invading force infringed the sacred space of the Neith temple at Sais; according to Udjahorresnet, they were removed at his request. An obscure, repeated reference to "disaster"/"commotion" reads:

I saved (the city's) people from the very great disaster, which befell in the entire land. There was not its like in this land. (Posener 1936: pp. 18–21, ll. 33–35; 40–41).

Is this a description of the effects of the Persian war? Or does its position in the recital of conventional pious acts and civic virtues normally evoked in commemorative autobiographies of this type mean that it is wrong to assign it such a specific meaning? Commentators differ (e.g. Posener 1936: p. 169; Lloyd 1982a). Whatever the case, the fact remains that Udjahorresnet transferred his loyalty to Cambyses (and later Darius I), and prided himself on serving *all* rulers of Egypt with equal distinction. But his position within Egypt's government changed: From a prominent position in the royal administration, he served as a scholar under the Persians, although he was honored as shown by his tomb at Abusir (Bareš 1999), and his later cult (Anthes 1965: pp. 98–101). Besides Cambyses' reordering of temple incomes, and a level of bureaucratic continuity indicated by the reused seal and a text rehearsing the long history of a dispute (Vittmann 1998), the arrangements made for Egypt's government are not clear. Cambyses spent the rest of his reign in the country (three or nearly four years, depending on which chronology is adopted) in order to ensure Persia's hold. Stories about the treatment of the defeated Egyptian ruler diverge: According to Herodotus, he was executed after trying to foment a revolt, while Ctesias says that he was taken prisoner and deported, along with 6000 fellow Egyptians, to the Persian homeland.

Reception and Accommodation

Both Babylonia and Egypt offer insights into the elements deployed by Cyrus and Cambyses to rally support from local élites and accommodate themselves to the demands of age-old traditions. The Cyrus Cylinder, commemorating building work in Babylon,² the Verse Account, the bricks, and the Chronicle present Cyrus as a restorer of order and supporter of Babylonian cults, and integrate him into the sequence of legitimate, pious kings. Similarly, Cambyses is presented by Udjahorresnet as transformed into an Egyptian pharaoh, and, along with the evidence of the Apis stele and sarcophagus, as actively taking up the cultic duties associated with that office and receiving Egyptian titles. Such accommodations were the result of negotiations with local representatives, as suggested by the delay in Cyrus' entry into Babylon, the personal appeals to Cambyses described by Udjahorresnet, and what appears to have been a delay in the former's selection of the new Apis bull (Briant 2002: pp. 887–888). Also notable is the fact that both kings vilified their immediate predecessors: Nabonidus, like Amasis, had seized the throne by force. In Cyrus' case, every effort seems to have been made to link him to earlier, famous rulers such as Nebuchadnezzar II and Assurbanipal, who had carried out extensive, particularly pious, construction work. For Cambyses, we have stories in Herodotus and Ctesias that relate him directly to Apries (589–570

BCE), overthrown by Amasis: In these he emerges as either Apries' grandson or husband to his daughter, hence bent on vengeance, further illustrated by the story of his public, ceremonial annihilation of Amasis' mummy. It also turns him partly into an Egyptian (Lloyd 1982b). In both instances, the invaders could thus legitimate their rule by presenting it as a return to an earlier proper order instead of the social and political disruption it was.³

This disruption, hidden behind a surface continuity, is reflected in the refocusing of power and resources in the Persian homeland. Local notables, such as members of the Babylonian Egibi family and Udjahorresnet, had to present themselves at royal courts in Iran (Tolini 2011: pp. 19–20; Posener 1936, no. 1, l.43); Babylonian laborers were called up for construction work there (Henkelman and Kleber 2007). A striking illustration is the foundation of the dynastic center of Pasargadae in Fars, where decoration and building techniques indicate the use made by the conquerors of the conquered (Nylander 1970; Root 1979).

NOTES

- 1 It is usual to date the Persian invasion to 525 BCE, but Quack (2011) has put forward strong arguments in favor of placing it in 526 BCE.
- 2 Two tablets with extracts from the Cylinder in the British Museum suggest that the text of this foundation document circulated.
- 3 Note the traditions in Herodotus and Xenophon that Cyrus was the Median king's grandson, while in Ctesias he marries his predecessor's wife and honors Astyages as "a father."

TO ALEXANDER**

CHAPTER 30

Imperial Crisis

Gundula Schwinghammer

Sources

In trying to form an opinion about what really happened in connection with Darius' accession to power – the sequence of the events, their causes and effects – it is important first to examine and evaluate the extant sources.

In the form of the Bīsūtūn monument there exists a first-hand contemporary account which Darius himself had made public after his rise to power and in which he gave his version of the events after the death of his predecessor. The rock relief and the accompanying inscriptions are located in the northwest Iranian province of Kermanshah. The inscription is trilingual – it is written in Old Persian, Babylonian, and Elamite – and is also illustrated (see Trümpelmann 1967). The relief shows Darius with his foot on a conquered enemy. This figure represents the magus Smerdis, but he is called Gaumāta here because, as noted in the inscriptions, the magus Gaumāta had fraudulently claimed to be King Cambyses' brother Smerdis and had seized power. Facing Darius are nine men tied together with a rope around their necks and their hands tied behind their backs. These are the rebels – the so-called “liar kings” – defeated by Darius in several battles.

Classical sources also dealt with the story of Darius' accession to power and thus with the catalyst of the imperial crisis. An important source is the narration of the events in Herodotus' “Histories”: One of the central figures in that account is Smerdis. He first encounters the reader in connection with his

brother Cambyses, the king, whom he accompanied to Egypt. The “Histories” also relate that Cambyses suspected his brother of aspiring to the kingship. Therefore he sent Smerdis back to Persia in order to have him secretly killed by Prexaspes, the close confidant of the king. However, this was not the end of the story because Smerdis – or a person impersonating him under that name – seemingly reappeared. Herodotus relates that the magus Patizeithes, who had been entrusted by Cambyses with the administration, had learned about the murder. Since he had a brother who not only looked like Smerdis but also bore the same name, Patizeithes proclaimed him as king. When Cambyses heard about this, he made sure that his order to assassinate Smerdis had been executed, and set out for Susa. On the journey he had an accident resulting in serious injury and died. The result was that the magus Smerdis, who profited from Cambyses’ as well as from the real Smerdis’ deaths, held power for seven months (Herodotus, 3.61–67).

Otanes, a Persian noble, became suspicious, and after the suspicions were substantiated, he took six other noble Persians into his confidence. Darius was one of them (Hdt. 3.68–70). He managed to persuade his co-conspirators to take immediate action, whereupon the conspirators implemented their plan. They infiltrated the palace and Darius killed the false Smerdis (Hdt. 3.71–79).

But Herodotus’ version is not the only one. The events had been taken up also by Aeschylus (see Högemann 1992: pp. 44–46), Justin (see Kuhrt 2007: p. 165), Ctesias (see Högemann 1992: p. 64), and Xenophon (see Högemann 1992: pp. 63–64).

In sum one may say that there exist two possibilities:

- 1) The official version, proclaimed by Darius, supported and complemented with many details by Herodotus, is the correct one. It implies that Cambyses had ordered his brother Smerdis to be secretly killed, and that a magus named Gaumāta, pretending to be Smerdis, in the absence of Cambyses assumed power. Cambyses died unexpectedly, leaving no offspring. Darius, intending to prevent the false Smerdis from becoming the legitimate successor of Cambyses, by intervention killed him, ascending himself to the throne.
- 2) The official version manipulates the truth, is a make-believe. The false Smerdis is an invention by Darius to motivate his usurpation. Darius in fact had killed the real Smerdis, the legitimate heir, who, after the untimely death of Cambyses, had taken power.

Darius’ rise to power, the question of whether or not he was an usurper, and the identity of Smerdis/Gaumāta have long been discussed in the scientific community, and the opinions in research diverge widely. Various arguments

are being used intended to demonstrate that Smerdis was in fact the brother of Cambyses and the true heir to the throne who was eliminated by the conspirators, and that the story about the fraudulent magus Smerdis had been invented by Darius for propagandistic reasons to legitimize his rule. Meanwhile, others maintain that Darius had told the truth when he claimed a magus had cheated all and seized power in an illegal manner. Already more than 100 years ago the scholars Paul Rost (1897: pp. 105–247) and Hugo Winckler (1898: pp. 38–45) offered the theory that Darius had not been telling the truth and that the story was invented by the Achaemenid king. This opinion had found little acceptance at first. But later voices grew more numerous, putting Darius' credibility in doubt. For an overview see Kipp (2001) with a compilation of arguments as to the credibility of Darius, *contra* (186–205) as well as *pro* (218–229).

The Triggering and the Course of the Crisis

Whichever version one is inclined to prefer, the undisputed fact remains that the result of the events was the accession of Darius to royal power, which in turn triggered numerous revolts throughout the empire. Table 30.1 provides a survey of these revolts which Darius had to put down in order to secure his power.

With the successful elimination of his predecessor in office and his accession to the throne Darius had taken an important step forward toward obtaining full power over the Achaemenid Empire. But his role was not yet secured by any means, demonstrated by the numerous uprisings which erupted everywhere and which meant a serious threat to himself as well as to the empire.

In what follows the unfolding of the crisis and Darius' reaction to it will be set out, the listing of the uprisings following the sequence described in the Bīsutūn inscriptions.

The first opponent Darius had to confront in order to safeguard his power was Āçina, who arose against him in Elam, the core region of Persia, calling himself – according to the Bīsutūn inscriptions – king of Elam (see Table 30.1). At first sight one might be tempted to think that this rebellion – happening in Elam, in the center of Persia – could be potentially dangerous to Darius' rule. But compared with the uprisings subsequently mentioned in the inscriptions, the one led by Āçina is set off from the others by two distinct features. Firstly, the text referring to Āçina does not mention any legitimation of his claim to power by way of descent from an earlier, rightful king. This is in contrast to the rebellions of Nadintabaira, Phraortes, Tritantaichmes, Vahyazdāta, and Araxa, because in their case Darius mentioned their claim to be of royal descent (see Table 30.1). Only in two other cases, with Martiya and Frāda, is a

Table 30.1 Name of the rebels, place of the revolt, the claimed title, and the “legitimation.”

Name of the “rebel” (spelling after Schmitt 2009)	Place of the revolt/claimed territory	Claim to power (title)	Legitimation
Gaumāta	Persia, Media and other lands (DBelam. § 10 and § 11 (ex 12) JA 1993: 43. DBop § 11 and § 12 Schmitt 2009: pp. 42–43 DBbab. § 11 and § 12 CII 1978: 55.)	King (DBelam. § 11 (ex 12) JA 1993: 43. DBop § 12 Schmitt 2009: p. 43. DBbab. § 12 CII 1978: 55.)	
Āçina	Elam (DBelam. § 15 (ex 16) JA 1993: 45. DBop § 16 Schmitt 2009: p. 47. DBbab. § 16 CII 1978: 55.)	King (DBelam. § 15 (ex 16) JA 1993: 45. DBop § 16 Schmitt 2009: p. 47. DBbab. § 16 CII 1978: 55.)	
Nadintabaira	Babylonia (DBelam. § 15 (ex 16) JA 1993: 45. DBop § 16 Schmitt 2009: pp. 47–48 DBbab. § 16 CII 1978: 55–56)	King (DBelam. § 15 (ex 16) JA 1993: 45. DBop § 16 Schmitt 2009: p. 48. DBbab. § 19 CII 1978: 56.). Here it must be drawn attention to a difference in the versions. Only in the Babylonian version he calls himself king.	Legitimation of sovereignty through Nabonidus: “...., the son of Nabū-na’id, king of Babylon.” (DBelam. § 15 (ex 16) JA 1993: 45. DBop § 16 Schmitt 2009: p. 48. DBbab. § 16 CII 1978: 56.)

genealogical legitimization lacking. The special circumstances of their cases will be dealt with later.

A further difference from the descriptions of the subsequent rebellions is evident in respect to the military activities involved on the part of Darius, or their lack. As regards the majority of the uprisings – those of Nadintabaira, Phraortes, Tritantaichmes, Frāda, Vahyazdāta, and Araxa – the military procedure by Darius was detailed in the Bīsutūn inscriptions, stressing the success of these operations of the Achaemenid king. In contrast to this, no military operation is mentioned in Ācina’s case, nor in that of Martiya. Only the following brief statement is found in the inscriptions: “Then I sent a messenger to Elam. They sent that Ācina, a prisoner, to me. I executed him” (DBelam. § 16 (ex 17) JA 1993: 45. DBop § 17 Schmitt 2009: p. 48. DBbab. § 17 CII 1978: p. 56). The most likely explanation as to why Darius did not mention any armed conflict is that any such had not taken place, and that other circumstances had caused the downfall of Ācina. If one believes the Bīsutūn inscriptions, no military intervention by Darius was necessary to regain control of Elam. The very brief mention of Ācina’s capture rather suggests a secret operation instead of an open military intervention. Even if we cannot be certain about the details it seems that this rebellion was put down without any great efforts on the part of Darius. If we speculate further it would appear that Ācina did not have not sufficient support in Elam, particularly not with the local nobility, and so did not really constitute any danger to Darius’ rule.

The situation is different in respect of the rebellion of Nadintabaira in Babylon. Its potential dangerousness results from the rebel’s particular claim. Nadintabaira named himself “I am Nebuchadnezzar, the son of Nabū-na’id” (see Table 30.1). Araxa, the last-mentioned “liar king” of the monument, also claims this descent (see Table 30.1). The importance of this statement of royal descent becomes clear if one considers it in the light of Lincoln’s remarks: “The patronym announced their project as one of restoration, since Nabonidus was Babylon’s last native king until defeated by Cyrus. The throne-name they chose also had its significance, recalling Nebuchadnezzar II, greatest ruler of the Neo-Babylonian era.” (Lincoln 2005: p. 174).

This claim to power by Nadintabaira makes it obvious that in this case Darius did not have to deal with a local uprising but was confronted with a threat of imperial dimensions. An aggravating factor was that Nadintabaira had been acknowledged one month before Gaumāta’s death as king of Babylon, as two documents from Kutha show (Nr. 48 and ASJ 19 1; Lorenz 2008: pp. 6 and 121–122). The situation resulting from all this motivates Darius, differently from with Ācina, to describe in detail the military operations which he undertook to deal with this adversary (DBelam. § 17 (ex 18) – § 19 (ex § 20) JA 1993: 45–46 DBop § 18 – § 20 Schmitt 2009: pp. 48–51. DBbab. § 18 – § 20 CII 1978: 56). It turns out, then, that in the case

of Nadintabaira, Darius had to deal with an opponent whom he had to regard as a serious threat to his own claim of power, even if in the end he could decide the military confrontation in his favor.

The rebellion, that of Martiya, again took place in Elam and presents a similar picture as in the case of the “liar king” Ācina. Considering the position of Elam, this uprising also could have endangered Darius’ power to a certain extent. But, as with Ācina, it subsided and in effect proved harmless. This becomes clear through several circumstances. Again in the Bīsutūn inscriptions there is no reference to a genealogically founded claim to power by the “liar king,” nor is there any mention of any military confrontations. Instead the case of Martiya is characterized by quite a different special circumstance which represents a singularity, because he was eliminated by his own followers. The Bīsutūn inscriptions give also the reason for their betrayal. It occurred because Darius just happened to be nearby with his force, and the rebels, terrified, rather than suffer military defeat and death surrendered by killing Martiya themselves (DBelam. § 21 (ex 23) JA 1993: 47. DBop § 23 Schmitt 2009: p. 52. DBbab. § 23 CII 1978: 56).

Following the text of the Bīsutūn inscriptions, the rebellion next to be put down by Darius was that of Phraortes, who proclaimed himself king of Media. As shown in Table 30.1, his legitimation was based on belonging to the generation of the heroic ancestor Cyaxares, as in the case of Tritantaichmes, who had proclaimed himself king of Sagartia and for this reason also belongs to the Median territory (Rollinger 2005: p. 22).

On account of the legitimation of the two “liar kings” and their situation within the Median territory, their uprisings shall be discussed together. Both Median rebels did not base their claim to power on dynastic reasons but through association with a heroic figure, Cyaxares. Their legitimation therefore was attempted by claiming membership of a gens which descended from a historical personality of western Iran who – it must be noted – was regarded as such but not as the actual founder of the empire (Rollinger 2005: p. 25). The special danger which these two rebellions signaled to Darius’ claim to power lies in the fact that the tribal confederation based on Cyaxares was not confined to Media alone (Rollinger 2005: p. 26), and that accordingly their claim transcended the Median core region. Thus the “liar kings” Phraortes and Tritantaichmes by their claims were challenging Darius’ reign in an extraordinarily dangerous manner. This assessment is confirmed also by the fact that in their case the respective uprisings were suppressed by military interventions mentioned in the inscriptions (DBelam. § 22 (ex 25) – § 26 (ex 33) JA 1993: 50. DBop § 25 – § 33 Schmitt 2009: pp. 53–62. DBbab. § 25 – § 33 CII 1978: 56–58).

The uprising of Frāda shows some remarkable characteristics which, on first sight, provide an ambiguous view of this rebellion. A seeming contradiction

exists in the fact that in his case no legitimation based on royal descent is reported, yet nevertheless there is mention of a military confrontation. In addition, Lincoln (2005) has pointed out other extraordinary features which characterize Frāda's rebellion. Lincoln first refers to the adscriptions joined to the portrayals in the Bīsutūn monument (DBb-DBj). Contrary to other "liar kings," the portrayal of Frāda lacks several important indications, such as his throne-name, his genealogy, or any connection with earlier royal lineage. So the text lacks any indication as to how Frāda wished to legitimize his claim to power. Also in other points he differs markedly from the other insurgents. Personally he does not present any claim. Apparently he was chosen by his countrymen, and in the Old Persian version he is called their leader (*maθišta*), not – as in the Elamite version – their king (*sunḫuk*). In the Babylonian version the text is damaged to the extent that the relevant passage is not legible (Lincoln 2005: p. 176, with note 12). From all this Lincoln concludes that Frāda apparently was considered a comparatively harmless opponent (Lincoln 2005: pp. 175–179). If one accepts this conclusion, then, judging by its potential danger to Darius' claim, Frāda's insurgence may be compared to those of Āçina and Martiya, although in Frāda's case military action was necessary in order to suppress it (DBelam. § 31 (ex 38) JA 1993: 51. DBop § 38 Schmitt 2009: pp. 65–66 DBbab. § 38 CII 1978: 58).

The last but one of the uprisings described in the Bīsutūn inscriptions is that of Vahyazdāta, who had proclaimed himself king of Persia and had thus tried to enforce his claim in the center of Darius' power. By this he challenged Darius in extraordinary fashion and thus represented an enormous danger to Darius' kingship, not only by claiming to be king of Persia but also by his legitimation, which he based on his claim to be the son of Cyrus: "I am Smerdis, the son of Cyrus" (see Table 30.1). In the words of Lincoln (2005: p. 173): "The two men who represented themselves as 'King' (Gaumāta and Vahyazdāta) thereby claimed the right to rule over the empire as a whole." Thus Vahyazdāta not only rose against Darius in part of the empire but by claiming the kingship of Persia he also put his claim to the empire as a whole, as the genealogy he adduced demonstrates. So it is not surprising that in the context of this "liar king's" rebellion, the military actions necessary to suppress it were described in detail in the monument (DBelam. § 34 (ex 41) – § 34 (ex 42) JA 1993: 51–2. DBop § 41 – § 42 Schmitt 2009: pp. 67–69. DBbab. § 41 – § 42 CII 1978: 59).

The last-mentioned rebellion is that of the "liar king" Araxa, who had proclaimed himself king of Babylonia. As in the case of Nadintabaira, who also rose up in Babylon and had presented the same genealogical legitimation, Araxa's rebellion presented a not inconsiderable momentum of danger toward Darius' maintenance of power. For this reason it is also not surprising that the military confrontation is given prominence in the inscriptions (DBelam. § 39

(ex 49) JA 1993: 54. DBop § 50 Schmitt 2009: pp. 73–74 DBbab. § 50 CII 1978: 60).

Finally, attention must be drawn to the fact that a further figure, that of the Saka Skunxa, was added later to the relief of the Bīsutūn monument (Nagel 1983: p. 184). But since Darius at the time of this rebellion was in full possession of his power, Skunxa represented no danger to his reign and therefore can pass as a comparatively ineffective opponent (Lincoln 2005: pp. 178–179).

Conclusion

Darius, though his accession to power provoked a dangerous crisis in the empire, not only managed to successfully overcome it but came out stronger than before. He secured his rule, under his dominion the empire enjoyed its maximal extension, and thus he is considered one of the greatest of Achaemenid kings.

CHAPTER 31

The Establishment of the Achaemenid Empire: Darius I, Xerxes I, and Artaxerxes I

Robert Rollinger and Julian Degen

Sources and Perspectives

Our available sources about the first three Achaemenid kings are far from being consistent. The challenge of writing a history of the early Achaemenid Empire is based on the problem that mainly external sources need to be consulted to make basic statements. In fact, Greek authors provide us with the most comprehensive accounts, which are prone to contrast the Persian Empire with their own cultural milieu (cf. the collection of all relevant sources by Kuhrt 2007). These Greek sources, although labeled by modern historians as early examples of “historiography,” do not present accurate reports but highly biased “views” with a very specific focus on the Persian Empire and its kings. Furthermore, the so-called Persian Wars had a deep impact on the way Greeks (and later “Europeans”) conceptualized their past and their identities. Therefore, the modern historian has to distinguish carefully between “facts” and “interpretations.” Although modern historians tend to present their works as studied results of “*quellenkritik*” being capable to clearly discern between these different levels, this optimism is frequently not justified.

In addition, we have a wide variety of indigenous sources, whose treatment is also not without problems, since they develop specific perspectives. The Achaemenid royal inscriptions provide information about royal self-perception and the Persian conception of kingship (see Chapter 6 The Inscriptions of the Achaemenids). For Darius I, we have a considerable number of these texts,

which served as role models for his successors Xerxes I and Artaxerxes I. The royal inscriptions of the first three Achaemenids certainly need to be considered as products of a formative phase of experimenting with new strategies of legitimation, which mask historical narratives out (Rollinger 2014a: pp. 155–57; 2012a,b). Aside from the “view from above,” we can obtain information on administration, economic, and social aspects through a wide range of sources. Official sources such as the enormous number of Persepolis Fortification Tablets provide insight not only into administrative affairs of the empire (Jacobs et al. 2017; see Chapter 7 Elamite Sources) but also into the religious landscape of Persis (Henkelman 2008). In the same way, Aramaic parchments give an insight into the administration and social hierarchy of the satrapy of Egypt (see Chapter 9 Aramaic Sources). Meanwhile, cuneiform documents from various archives (Stopler 1985; Jursa 2005) lend themselves as sources to reconstruct a socioeconomic history of Babylonia under Persian rule (Kleber; 2008, 2017; Waerzeggers 2014; Heller 2010; Joannès 2020). Moreover, Persian affairs are one of the main issues of the books Ezra, Nehemia, and Esther of the Old Testament (see Chapter 10 Biblical Sources).

Indeed, the indigenous sources of the multiethnic and multicultural empire with their various perspectives provide insights into many aspects, but we still need to consult Greek sources to write a history of events of the Achaemenid Empire (cf. Dandamaev 1989; Briant 2002a).

War and Conquest: Darius I (522–486 BCE) and Xerxes I (486–465 BCE)

From a western perspective, the Persian Wars have always been the most prominent events not only in the reigns of Darius I and Xerxes I (and Artaxerxes I) but for the Persian Empire as a whole and for its history (Figure 31.1). This dominance was challenged only by Alexander’s campaign against Darius III and the downfall of the empire. Naturally, this perspective downgrades the empire to a peripheral phenomenon of the Greek (European) world; however, it is an essential one since alleged Greek peculiarity and European idiosyncrasy have always been regarded to have developed in a world-historical struggle between East and West. In the last decades, this perspective has partially eroded and Achaemenid Studies has evolved as a discipline in its own right, but still, at least in Ancient History and Classical Studies, the view of the Achaemenid Empire is generally dominated by discussing its defeats during the Persian Wars. This cannot be demonstrated only by the myriads of western publications on this topic but also by observing how these events are presented to a general public. The main source for the events and

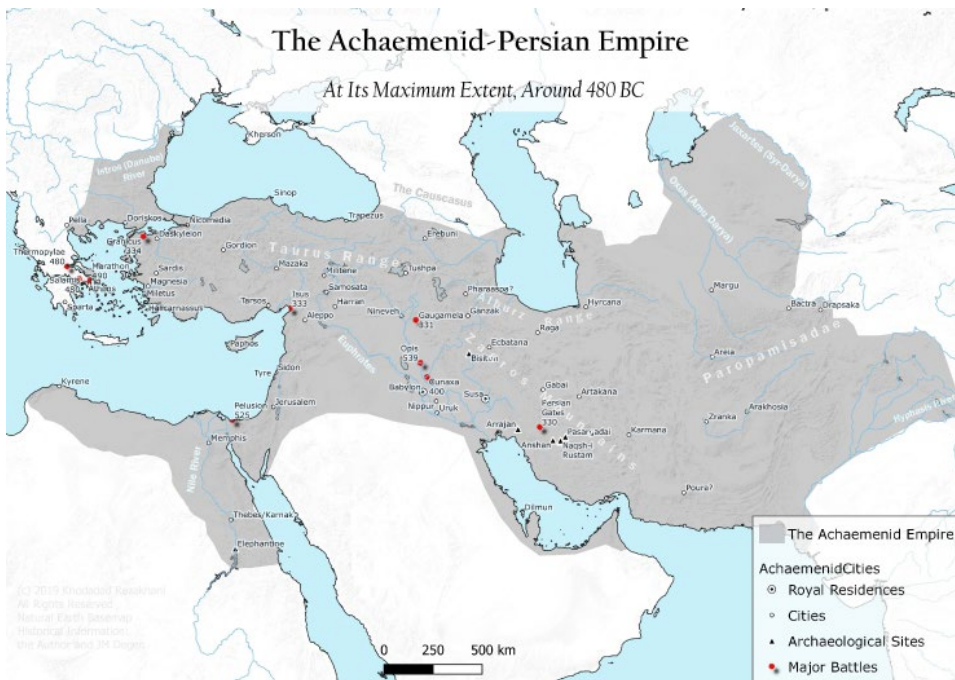

Figure 31.1 Map of the Achaemenid-Persian Empire at its maximum extent, around 480 BCE. Natural Earth Basemap (Historical Information: Khodadad Rezakhani and Julian Degen), reproduced by permission of Khodadad Rezakhani.

their chronology are Herodotus' *Histories*, published in the last third of the fifth century BCE (see Chapter 14 Greek and Latin Sources). Although it is generally acknowledged that the *Histories* are not a neutral report of facts, they are nevertheless taken as a trustworthy source for the general course of events. This is why modern representations of the Persian Wars are actually rationalized reproductions of Herodotus' account without raising serious doubts about the quality and perspective of the source. This approach becomes even more astonishing when we take into account the broader classical tradition on these wars that partially offers a considerable different course of events and chronology (Bichler 2016c). Even if one decides to dismiss these accounts as later fabrications, the problematic nature of the available sources remains a serious obstacle in reconstructing the events. This does not become better by referring to the fact that Persian sources remain silent about Darius' and Xerxes' campaigns in the west. This silence cannot be explained by arguing that the Persians refrained from telling anything about their defeats. We may just remember that this is also true for resounding Persian successes such as, for example, Cambyses' conquest of Egypt. It is highly probable that the Persian view of the events and their importance is entirely disproportional

compared with the Greek and western perspective. This later perspective is interwoven into a Greek master narrative that can be structured into three parts (for all details see Cawkwell 2005). Parts 1 and 2 pertain to the reigns of Darius I and the beginning of Xerxes' rule. They are primarily reported in great detail by Herodotus in his *Histories*. Part 3 belongs to the remaining reigns of Xerxes and his son Artaxerxes I. It is dealt with only cursorily by authors such as Thucydides, Ctesias, and others (Wiesehöfer et al. 2011; Wiesehöfer 2006; see Chapter 14 Greek and Latin Sources).

Part 1 can be described as the prehistory of the events that take place in the early years of Darius I. After the Achaemenid king has established his reign, he starts several campaigns at nearly all fringes of his empire that result not only in major conquests but also in serious setbacks. The Cyrenaica and the Indus valley are integrated into the empire (Giangiulio 2011; see Chapter 52 India), and Persian armies move for the first time from Asia to Europe and subdue Thrace and Macedonia, which become a Persian satrapy and a client kingdom respectively (Boteva 2011; Zahrnt 2011; Vasilev 2015). It is in these times that the Persian Empire also gains substantial influence beyond Macedonia and even Athens becomes a Persian vassal state (Waters 2016).

Herodotus delivers a detailed and miraculous report on Darius I's campaign against the European Scythians beyond the Danube that nearly ends in a catastrophe whereas in his Bisitun inscription Darius himself praises how he successfully subdued the Saka leader Skunkha and his tribe in central Asia. Whether there was only one or even more campaigns against the nomads of the Eurasian steppe whom the Greeks called Scythians and the Persians Sakā is not entirely clear (Tuplin 2010; Lanfranchi 2009–2011; Rollinger/Degen 2020).

The final episode of Part 1 starts with the Ionian Revolt, the first event that can be exactly dated: 500–494 BCE (see Chapter 45 The Greek World). If we follow Herodotus, the revolt was not triggered by the Ionians' general desire for liberty from the Persian yoke but by a maneuver of the tyrant of Miletus, Anaxagoras, to distract attention from his unsuccessful attempt to subdue the island of Naxos.¹ However, a coalition of Ionian city-states sacked and burned the city of Sardes, the center of Persian provincial administration. The consequences for the Ionians were dramatic. The Persians reconquered all lost territories and inflicted a major defeat on the Ionian coalition on land and at sea. Since Athens and Eretria had been in favor of the insurgents and provided assistance, the Persians prepared for punitive expeditions against these (disloyal) poleis. With these punitive expeditions, a perfect pretext for the conquest of further territories, Part 2 gains momentum.

A naval expedition in 492 BCE, led by Mardonius, harassed insubordinate islands in the central Aegean and appears to have been a mixture of intimidation, reconquest, and exploration. Thrace and Macedonia were reintegrated into the empire, although the fleet was heavily damaged by a storm on its way

back at Mount Athos. A major event took place two years later when again a Persian fleet appeared in the Aegean, this time led by the admirals Datis and Artaphernes. Naxos was subdued, but it became evident that the Persians could count on local allies in this area. This is at least true for Aegina, and at Delos the Persians sacrificed and payed reverence to Apollo. Before Persian troops eventually disembarked in Attica, the polis Eretria was sacked because of its involvement in the Ionian Revolt. The result was the famous battle of Marathon (490 BCE), a major victory of Athens and Plataeae that was celebrated accordingly, not only in the following decades (Bichler 2016b). Whether the Athenians defeated a Persian invading or exploring force may be debated. Be that as it may, Marathon became a highly charged place of memory in Athenian, Greek, and European history (Zahrnt 2010; Funke and Jung 2012).

Herodotus delivers the most detailed account of the great campaign that the Persians launched ten years later (481/79 BCE). The Persians approached with a huge army and navy, and the land troops were purportedly led by the Great King himself. The Athenians had not been inactive in the preceding decade but had launched an extensive shipbuilding program that transferred the city into the position of a major naval power. More than any events before, the following confrontations were apparently not a war between *the* Greeks and *the* Persians. The Achaemenid-Persian Empire was a multiethnic state, and there were considerable contingents of Greeks within their ranks. Athens and the leading power Sparta organized an Anti-Persian coalition ("The Hellenic League"); however, from the Thessalians in the north to the Thebans in Boeotia, Greeks fought on the side of the empire.² According to the Greek narrative, the empire approached like an avalanche with an inconceivable number of people and resources. This approach is embedded in a discourse of Persian hubris and neglect of divinely set borders. The Great King is presented as an Asian despot who treats his soldiers like slaves and who is characterized by unlimited blindness. His troops' crossing of the Hellespont on a ship's bridge and his canal-building project cutting the isthmus of Mount Athos are not taken as significant examples of Ancient Near Eastern technical know-how (Rollinger 2013) but as deeds of a tyrant who shoots far beyond the mark and loses sight of any proportion. Against such excessive power only an extraordinary heroic deed could demonstrate that at least morals and virtue were on the right side. Leonidas' and the Lacedaemonians' heroic death at Thermopylae have been, from a strategical point of view, entirely pointless and without any value but effective enough that even 2400 years later Hermann Göring could still refer to this event intending (in vain) to strengthen the stamina of the encircled Sixth Army at Stalingrad (Albertz 2006: pp. 293–307). Soon afterward, the troops of the empire conquered and sacked Athens. If Xerxes had in mind to launch a revenge campaign for the Ionians' sack of Sardes and to

execute penal sanctions on an insubordinate vassal state that had assisted the Ionians' revolt, this campaign already reached one of its major goals with the conquest of Athens. But this is not the perspective of our sources. Fighting continued, and with the lost naval battle of Salamis in the same year the empire suffered a substantial setback. After this, the Great King is said to have fled head over heels back to Asia, leaving his troops and their commander Mardonius alone deep in enemies' land. However, Salamis was not decisive enough to force the empire to retreat from Greece. To the contrary, Mardonius and his troops wintered in central Greece and sought the decision in the next year. In 479 BCE, the opponents met at Plataea for the final confrontation. The anti-Persian coalition was led by the Spartan king Pausanias, who, according to Greek tradition, inflicted a major defeat on the empire. Mardonius is said to have lost his life on the battlefield, and subsequently the empire had to give up all its positions in Greece and Macedonia as far as the Hellespont. It was in the wake of this success that Sparta pulled back (479/8 BCE) and Athens became the head of the so-called Delian League, an institution with members with originally equal rights. This new development marks the beginning of part 3 of the Persian Wars.

Indeed, the new Delian League ascribed to take revenge for the Persian invasion, to devastate the Great King's land, and to protect the liberty of the Greeks who had formerly been under the Persian yoke, but it soon became a vehicle of Athenian dominance and imperialism (Kehne 2014; Ruffing 2016). It started to intervene in western Asia Minor and beyond and celebrated a major victory over the empire in a combined land and sea battle at the river Eurymedon in Pamphylia around 465 BCE. With the death of Xerxes in August 465 BCE, fighting did not stop but continued until deep into the reign of Artaxerxes I when with the purported peace treaty of Callias (449/8 BCE) the conflict parties agreed to silence their weapons and to respect their spheres of interest (for the problems of reconstructing the events between the 460s BCE and the "Peace of Callias" in 449/8 BCE, see Kahn 2008: pp. 430–436).

Reviewing the evidence so far introduced it becomes apparent that the modern historian faces considerable problems in reconstructing the major events. There can be no doubt that Greek "historians" like Herodotus and others refer to real events as far as the basic structure of their reports is concerned. As the "Perserschutt" ("Persian debris") on the Acropolis impressively demonstrates, Athens was conquered and sacked. The same is true for the battle of Marathon, as the still-visible mounds erected on the spot for the Athenian dead warriors exhibit (at least the tumulus at Vrana appears to host the remains of the Plataians who were killed in action, cf. Mersch 1995). The run of the Greek herald Pheidippides from the battlefield to Athens is, however, already part of the rich production of legends that started immediately

after the events (with Hdt. 6.105–106 Pheidippides runs to Sparta!) (Kertész 1991). It is in these succeeding decades that our earliest sources emerge and poets like Aeschylus and Simonides of Ceos deal with specific events of the Persian Wars (see Chapter 97 The Perspectives of Greek and Latin Sources).

With Darius I and Xerxes, the Persian Empire heavily intervened in Aegean affairs and led its armies deep into mainland Greece. It is also apparent that this “expansion” did not result in an integration of these areas into the Persian Empire and that Xerxes’ campaign did not succeed in the end. However, we do not know anything about the Persians’ strategic intentions and further-reaching plans. This is also true for the course of each battle and its outcome, although modern reconstructions pretend to be sure to know any detail (Konijnendijk 2012; Bichler 2016a). The picture of the Great King remains a caricature of an Ancient Near Eastern monarch, although with considerable nuances. Already Aeschylus described Darius I differently from Xerxes, the latter becoming an “oriental” specter despot and temple destroyer (Wieschöfer 2017). We can also not be absolutely sure whether and how the Great King really participated in these wars. The descriptions of Xerxes sitting on his throne and watching the battle of Salamis from a distance looks much more like a reflection of the well-known royal iconography as it is testified on seals and reliefs (Wieschöfer 2020). Even the report on the death of Mardonius in the battle of Plataea might be fictitious if the noble Mardonius mentioned some years later in a Babylonian document by referring to his far-reaching estates is the general of the Persian Wars (Stolper 1992).

However, if we put the Persian Empire into the general framework of Ancient Near Eastern empires of the first millennium BCE we can draw some general conclusions that avoid the predominant Eurocentric perspective on the events. As with all empires in world history, expansion and conquest were much more difficult and time consuming when facing a strong and coherent coalition of smaller states in a politically fragmented landscape than when just subduing a neighboring and already well-organized monarchy. As it looks, Cyrus and Cambyses conquered huge areas in comparably short time as the subjection of Babylonia, Lydia, and Egypt demonstrates (see Chapter 27 From Assurbanipal to Cambyses, and Chapter 29 The Great Conquests). The same appears to be true with the submission of Thrace and Macedonia. Compared with this, the Neo-Assyrian advance into the Zagros mountains and beyond the river Euphrates was a much more time-consuming task that became a matter of long breath. It took the Assyrians about 100 years and dozens of campaigns to finally subdue the resisting and never-ending coalitions of Syrian city-states until the area was under firm Assyrian control. One campaign was by far not enough to reach this goal (Baggs 2011). Assyrian ambitions can be defined only in a very broad sense. They can be described generally as ways of submission and recognition of Assyrian supremacy. This is important because

there appears to have been no master plan that sought to establish direct Assyrian control over all conquered territories. Recognition was the key, a principle that corresponded with the Assyrian king's claim to rule the world. Therefore, indirect rule was an essential instrument to organize domination on the "peripheries" (Lanfranchi 2011). And there was always the possibility of a different perspective on the advance of the Assyrian superpower. What the Assyrian king might have understood as paying tribute and thus as submission may have been interpreted by a local power as unique gift exchange.

These general observations are also true for the Achaemenid Empire. It is astonishing how fast the city-states in western and southwestern Asia Minor were brought under Persian control, but the Lydian state had certainly done considerable preliminary work in this respect. Things became different when the Great King decided to subject the territories on the Greek mainland. Whatever the Athenians thought about the implications of their approach to the Great King in 507 BCE seeking the Persians' assistance against a possible Spartan invasion, in the eyes of the Great King they became vassals and their territory a part of the Persian Empire (Waters 2016). From a broader perspective, this is another example of how empires become involved in conflicts at their border zones as they are drawn into local conflicts that soon trigger action and counteraction. With the Athenian intervention in the Ionian Revolt the Greeks challenged the empire's self-conception. The intention to rebuke the Athenians for their "oath-breaking" for sure played a central role for the Persian campaigns, but at the same time this was a welcome pretext for further expansion in the framework of an ideology that defined the Great King as the unrivaled ruler of the world (Rollinger 2017). To recognize Persian supremacy by paying tribute was the primary objective and to reach this goal every effort was worth taking. Different modes of how to rule and organize control, "despotism" versus "democracy," did not play a role in this context. When the Persians thought that democratic rule was more beneficial for their goals they did not hesitate to remove tyrants and to install democracies in Ionian states (Hdt. 6.43.3). And that powerful Persian opponents like Sparta were not democracies is a truism but nevertheless worth recalling. The efforts the Great Kings took to enlarge their control in the west were extraordinary and surpassed everything we know from preceding Ancient Near Eastern empires. Perhaps ongoing expansionism had become a kind of automatism,³ but the military machine of the empire had to face exceptional challenges. There was the problem of long supply chains that had to be organized on land and at sea. Although the Assyrian and Neo-Babylonian empires had already started to invest in navies with a Mediterranean perspective (Schaudig 2008), these empires actually remained great land powers. In contrast, the Achaemenid Empire was the first Ancient Near Eastern superpower whose navy matched the importance of its land troops. This navy became a strategic

force of its own, and the Persian Wars, from the suppression of the Ionian Revolt onward, were the new battlefield of this instrument. The supply and transport of the troops was a tremendous logistical task, and the crossing of the Hellespont on a gigantic ship bridge was only the most spectacular (Rollinger 2013: pp. 67–73). The extremely long supply lines had one major consequence that had to be taken into consideration. To succeed, the enemy had to be defeated not only fast but also completely. An undecided battle was a lost battle. The longer the enemy was still active, the higher was the danger of being forced to retreat and give up the Great King's far-reaching goals. From this perspective, one may wonder whether the battle of Salamis was such a bitter defeat as the Greek sources want to make us believe (Ruffing 2006). The same is also true for Plataea (Konijnendijk 2012). As far as Salamis is concerned, the Persian troops did not retreat head over heels (only the Great King is purported to have done so). To the contrary, the Persians wintered in Thessaly. This is the first example in the history of Ancient Near Eastern empires, as far as we know, that their armies did not return home after an annual campaign but stayed on the “peripheries” to continue their advance in the next year. This does not look as if the Persians suffered serious setbacks in 480 BCE. But it is also clear that the empire sought the final decision in the next year. Whether Plataea was a major defeat or a battle with indecisive outcome, the result was the same. The empire did not reach its goals, and its troops had to retreat. For the defenders, this was a major victory that offered entirely new opportunities – opportunities Athens was fairly soon ready to grasp.⁴

A further consequence was that the western “periphery” of the empire collapsed, Macedonia and Thrace shook off Persian supremacy, and the expanding reach of the Athenian fleet set the empire's coastal regions of the entire Levant in danger. In the following decades, confrontations were not fought in the Aegean anymore but also in southern Asia Minor, Cyprus, and Egypt (see below). This was a major setback for the empire and probably a consequence of its exhaustive overstretch during the Persian Wars. However, the empire did never lose sight of its initial goals, and from an ideological perspective, the Great Kings may still have pretended to control the Aegean. This they did in fact many decades later when the Peloponnesian War offered an entire new opportunity to intervene, which the Great King did not hesitate to do. Skillfully he played off Sparta and Athens against each other until he regained full sovereignty over Western Asia Minor and Cyprus.

Focusing on the Persian Wars from a more general viewpoint these confrontations initiated a new period in the history of the Persian Empire. Ongoing expansion that started with the reign of Cyrus grinded to a halt. With Xerxes I (after 480/79 BCE) and Artaxerxes I, the empire began to concentrate more on how to maintain what had been conquered than on how to subdue further enemies. It is up to the modern historian how to qualify the efforts of

maintenance as compared with conquest. The Persian Empire was extremely successful in both. From Cyrus to Xerxes it conquered regions from modern Pakistan to Greece, from modern Bulgaria to Libya. From Xerxes to Darius III, that is for 150 years, it successfully maintained what Alexander's successors lost or quarreled over immediately after the "Great's" death.

Revolts

"Revolts" and "empire" can be regarded as nearly synonymous terms. All empires in world history faced local revolts and rebellions almost permanently in some parts of their huge territories. Thus, these revolts should per se not be taken as a symptom of weakness and decline (Gehler and Rollinger 2014; Collins and Manning 2016; Howe and Brice 2016). This also applies for the Persian Empire where revolts started to emerge with the reign of Darius I. The Ionian Revolt that also affected Cyprus is the most prominent one in the west. Since the Great King saw Athens as a Persian vassal, the Persian Wars can also be interpreted as a response to oath-breaking and rebellion (Waters 2016). Apart from this northwestern frontier zone there were other regions where revolts played a major role during the reigns of Darius and Xerxes, i.e. Egypt and Babylonia. It is probably not by chance that we encounter these uprisings in core zones of former independent kingdoms that had developed specific identities, customs, and probably also political consciousness. Egypt remained a trouble spot in the reign of Artaxerxes I (see below) and in the fourth century BCE (Rottpeter 2007; Vittmann 2011; Ruzicka 2012). There were further revolts in the Levant and Cyprus in the fifth and fourth centuries BCE but none of these was a serious threat for the empire (Wiesehöfer 2011: pp. 721–725; Wiesehöfer 2016). Whether a revolt in Bactria transpired in the reign of Xerxes is a matter of debate. Herodotus reports about preparations of such an uprising by Masistes, the local governor and brother of the Great King, but he and his sons are said to have been executed before they could engage in any rebellion (Hdt. 9.113).

As already mentioned, Egypt and Babylonia appear to have been somehow specific cases. These were not only former independent kingdoms but economically especially rich provinces. Taking the good documentation from the Abbasid Empire as a comparison, it is not too far to conclude that also in Achaemenid times Babylonia was the economically most potent region of the empire (Kennedy 2009). In each reign of Darius and Xerxes Babylonia two times faced two revolts. In the context of the general turmoil after the death of Cambyses that affected the empire as a whole, cuneiform documents as well as the Bisitun inscription attest the uprisings of a certain Nidintu-Bel (Nebuchadnezzar III) and Arakha (Nebuchadnezzar IV). Both consciously

chose the throne name Nebuchadnezzar to recall the great past of Babylonian history. Nidintu-Bel's rebellion was contemporaneous with the very beginning of Darius' reign (522/1 BCE), whereas Arakha rebelled one year later (521/0 BCE). Both rebels had a firm basis in northern Babylonia (Babylon, Borsippa, Sippar; Nidintu-Bel also in Kutha) but controlled also Uruk (Lorenz 2008: pp. 87–88; Bloch 2015). Both were only in charge for some months until Darius crushed each rebellion by force. A similar situation occurred in the second year of Xerxes (484 BCE) when cuneiform documents refer to two further uprisings following immediately one after the other. The two usurpers, who, again, only ruled for some months, did not recall the Babylonian past in the same way as their “predecessors” but chose distinctive throne names: Bel-šimanni and Šamaš-eriba. Once more, both rebellions concentrated on northern Babylonia (Rollinger 1998; Waerzeggers 2003–2004). This was the last time that Babylonia revolted in Persian times.

The context and “prehistory” of these revolts have been convincingly explored in the last decades. Although there were personal and administrative continuities between the Neo-Babylonian, Teispid and early Achaemenid regimes (Kleber 2017, 2019; Klinkott 2019), considerable changes appeared on the horizon that more and more affected the economic and social structures of Babylonia. On the one hand, tax pressure increased continuously that touched traditional elites as well as ordinary people. On the other hand, there was a significant and persistent increase in prices from the middle of the sixth century BCE that turned extraordinarily steep in Teispid and early Achaemenid times (Jursa and Schmidl 2017). The reasons for this development are complex. The huge building projects that started in Neo-Babylonian and continued in Persian times resulted in a huge influx of silver that was the source for price inflation.⁵ At the same time, substantial resources of manpower and staples were redirected to regions outside of Babylonia. Simultaneously, the climate was turning to a drier phase that led to times of famine and starving (Kleber 2012). From this perspective, it becomes evident that it was especially the traditional elites that increasingly felt the growing tax pressure and feared for their privileges and positions. It was this social group that mainly supported the uprisings. The counterstrike of the empire was dramatic, as especially testified by Xerxes' reply on the rebellion of 484 BCE. The traditional northern Babylonian elites lost their positions in the profitable temple administration. This is even true for northern Babylonians in Uruk, who disappear from our sources. This dramatic break, however, did not affect cult and temple building. Babylonian temples were neither destroyed nor laid in decay (Henkelman et al. 2011; Heinsch et al. 2011). But the administration of the land saw a major shift toward a more and more imperial and non-local superstructure that strived for an optimal utilization of Babylonia's rich resources. Nevertheless, the Persian kings still used the title “king of Babylon,” thus

stressing continuity (Rollinger 1999). Whether they participated themselves in the Babylonian New Year's festival is, however, a matter of debate.

The source situation in Egypt is not as good as in Babylonia, but what we learn appears to follow the same patterns (for details see Agut-Labordère 2017; Vittmann 2011; Ruzicka 2012: pp. 26–34). As in Babylonia, the regime change from Cambyses to Darius I witnessed “national” unrest. For reasons we do not know, however, the Egyptian uprising of Petubastis III (about 522–520 BCE) is not mentioned in the Bisitun inscription but only attested by Egyptian documents. As in Babylonia, it becomes evident that starting with Darius' reign at the latest, the Persians began to establish an administrative superstructure superimposed on an already existing Egyptian layer. We can only surmise that this reorganization of local affairs was also joined by a more systematic collection of taxes and that more and more resources were directed out of the country. For Darius I, as for Cambyses, it is apparent that he presented himself in Egypt as an Egyptian pharao. For Xerxes, this is still debated, although there are inscriptions on vases where he is addressed as “king of Upper and Lower Egypt, Lord of Both Lands,” or as “Pharao the Great” (Vittmann 2011: p. 394). When Xerxes seized the Persian throne in 486 BCE, there was a further uprising by a Psammetich IV (486/5 BCE) attested by only a handful of papyri. Together with a general remark of unrest in Asia, Herodotus has this revolt already started at the end of Darius' reign (Hdt. 7.1). When it was crushed by Xerxes' armies at the very beginning of his reign he notes that the new Persian king “laid Egypt under a much harder slavery than in the time of Darius” (Hdt. 7.7). Whether this is a reflection of the ever-increasing tax pressure, so well documented in Babylonia, may be considered. Xerxes installed his brother, Achaemenes, as new governor, and as in Babylonia after the revolts of Bel-šimanni and Šamaš-eriba, the country remained stable for the rest of Xerxes' reign. For Egypt, the situation changed again in the reign of Artaxerxes I. This event has to be seen in a larger context that includes Asia Minor, Cyprus, and the Levant.

War and (Re)Conquest: Artaxerxes I (465–424 BCE)

The third phase of the Graeco-Persian wars had a truly Mediterranean dimension for the circumstances of the time. Hitherto the conflict had taken place in the Aegean Sea, Hellas, Thrace, and Asia Minor, which soon after the retreat of the Persian army in 479 BCE had extended over the southeastern regions of the Mediterranean Sea. This extension was based on the shift of political structures in Hellas and the Aegean Sea after the 480s BCE. During Xerxes I's campaign against Hellas his troops had to face the Hellenic League,

which transformed in the 470s BCE for the ongoing conflict to an Athenian instrument of expansion. While Peloponnesian city-states and others avoided further conflicts with the Persians, the later Delian League took the place of the “Panhellenic venture” as a war party and began to vie with the Persians for supremacy in the Aegean Sea. This new Aegean power was led by Athens, which emerged from a formerly regional sway over Attica to leader of the Delian League. This first Aegean Empire was mainly a product of Persian-Greek conflicts and Athenian-Spartan rivalry and served as a tool for Athens’ far-reaching imperialistic interests in the Mediterranean Sea (Kehne 2014). In the meanwhile, Sparta extended its power over the vast parts of Peloponnesus but had no further ambitions to extend its sphere of influence outside the peninsula. Hence, the situation in Hellas worked to the Achaemenids’ advantage and the empire was up to play both ends against the middle because the former political fragmented landscape in Hellas changed to a superregional mélange of the two dominating players’ interests.

Nevertheless, the complexity of the different conflicts between the Delian League, the Peloponnesian League, and the Achaemenid Empire is hard to overlook. Difficulties in reconstructing the general chronology of the third phase of the Graeco-Persian wars are on the one hand the lack of a general master narrative on Persian-Greek relations after Xerxes I’s campaign and on the other the contradicting accounts of our available sources. Herodotus’ account as our main source for both first parts of the Graeco-Persian wars goes a long chronological way up to the reign of Artaxerxes I and connects past events with the author’s own time. Thus, his work also contains important information about the Graeco-Persian relations after 479 BCE. Problems are caused by the difficult dating of the *Histories* (Irwin 2013, 2017) as well as Herodotus’ indirect criticism on imperialistic Athens through discussing contemporary Greek issues in a Persian disguise (Ruffing 2009, 2011). Apart from the *Histories* we need to consider other historical works as sources, such as those of Thucydides, Ctesias, Diodorus, and Plutarch. All these works are only providing more or less chronological guidelines for the modern historian, who is forced to work with contradictory accounts (for general problems: Libourel 1971: pp. 605–606; Kahn 2008: pp. 424–426; Briant 2002a: p. 579; Scharf 1955: pp. 308–318; Bichler 2016d). With the exception of a few documents in Aramaic and Babylonian language, the aforementioned sources provide only Greek perspectives of the conflict, whereas the Achaemenid Empire appears to be a silent giant.

It is distinctive for part 3 of the conflict that the Delian League was trying to stabilize its hegemony over the Aegean Sea by expelling the Persian land and naval troops out of Asia Minor’s coastal regions and by attempting to take over Cyprus. It was never Athens’ intention to bring to an end Persian rule over the Greeks in Asia Minor’s hinterland, as there was never an “iron

curtain” between areas controlled by Athens and the Persians (Whitby 1999; Briant and Descat 1998). Rather, its overarching imperialistic ambitions are at the fore, which are strategically related to Athens’ desire to seize plunder and thus justify the existence of the Delian League. Shortly after Xerxes I’s campaign, these circumstances caused campaigns against Persian troops in Thrace and in the region of the Hellespont. The Hellenic League’s troops were mainly responsible for successful campaigns up to Byzantium, but subsequent campaigns in harness were pursued no longer. This was why the Hellenic League’s supreme commander Pausanias was accused of having been bribed by the Persians. That caused contentions within the allies and ruled out further campaigns. From 479/8 onward, Athens began to exercise power over the islands in the Aegean Sea and the Greek cities in Asia Minor.

For that reason, the following two decades were characterized by the ascendancy of Athens as the leading power of the Delian League. Nearly all standard works for the Classical time refer to this period as an ascendancy of the Delian League and a deadlock of the Persian Empire (cf. Welwei 1999). A popular explanation of the alleged deadlock of the Persian Empire was its military weakness after Xerxes’ campaign in Hellas. However, modern scholars’ perceptions of the Achaemenid Empire’s policy against Hellas are based on uncritical readings of our sources as well as misunderstandings of their perspectives and Achaemenid imperial interest. These perspectives changed after 479 BCE when Greek authors showed more interest in a detailed description of Hellas’ political structures in the time of the so-called *pentecontaetia* (479–431 BCE). Thucydides as our main source for that time is clearly more focused on the political landscape on the eve of the Peloponnesian War than on examining Persian affairs. Thus, our available sources mask Persian-Greek relations nearly completely whereby we obtain only rudimentary information about Persian history (contra: Meister 1982). Aside from these historiographical problems, modern historians tend to overlook Xerxes I’s ambitions in stabilizing Persian dominion over the empire.

Nevertheless, Persian presence in the Aegean Sea was perceived by Athens as a hazard factor until the battle at the mouth of the river Eurymedon in 465 BCE, in which Persian troops were defeated in a combined land-sea battle. In the same year, Xerxes I was murdered and his son Artaxerxes I ascended the throne of the empire. The new king had to face the rising power of the Delian League, whose imperialism did not only jeopardize his most western satrapies but was focused now on the Levant and Cyprus. After securing essential support routes and holding control over the Aegean Sea, Athens’ aim was to firm up her increasing influence among the Greek islands. In this way, the Delian League focused on Cyprus, which was a strategic key position for Persian naval actions. Athens was aware of the danger of the Persian fleet as an unpleasant rival for her hegemony over the Aegean Sea. That Persian troops were still

a danger to the Athenian sphere of influence is supported by the fact that the Thracian city Doriscus remained under Persian control until the second half of the fifth century BCE.

During the campaign against Cyprus, the Libyan insurgent Inarus sent a request for assistance to the Athenian fleet. Inarus started a revolt against the Persians in the Nile Delta and promised the Athenians grain support in return for military assistance (Dandamaev 1989: pp. 238–239). Because of the contradicting Greek accounts about the Athenian campaigns in Egypt, it is hard to ascertain the exact length and details of Inarus' revolt.

The Libyan dynasts Inarus and (later) Amyrtaeus (Hdt. 3.15.3), who were probably patronage kings located on the western border of the satrapy of Egypt (for identification: Ruzicka 2012: p. 30; Quack 2006; Bichler 2016d), built up an army of mercenaries and penetrated the Nile Delta. That was not unusual for Egypt in the late period, when Libyan dynasts frequently caused problems as warlords in the Nile Delta. Modern scholarship calls these regional revolts led by foreign warlords the “Libyan disaster” of Egypt's Late Period (Ruzicka 2012: p. 19; Rottpeter 2007). The Athenians pursued Inarus' request for assistance and sent a secondment while the rest of the troops were still operating on Cyprus (Libourel 1971: pp. 607–608; Scharf 1955: p. 321). Before the Delian League arrived, Inarus achieved success against the Persian troops, which were defeated in a battle, but the garrison of Memphis prevented a further advance of the intruders.

In the meantime, Artaxerxes I ordered Megabyzus as satrap of the Trans-Euphrates satrapy to levy an army and also tried to persuade the Spartans to penetrate Attica. The financial power of the king to put pressure on inner Greek affairs brought him the epithet “the Longarmed” (Harrison 2011). Sparta accepted the Persians' gold and waged a war against Athens, which modern historians call the first Peloponnesian war (457–446/5 BCE). This situation caused serious troubles for the Delian League, which had to fight a war on two fronts. Nonetheless, the Delian League was able to keep on operating in the southeastern Mediterranean Sea. From an Athenian casualty list (IG I² 929) we get the information that troops of the Delian League were operating until 458 BCE in the Levant. Nevertheless, the Athenian campaign in Egypt and on Cyprus ended in a disaster because Inarus and his allies were thoroughly defeated by Megabyzus' army. The results of the Egypt intermezzo in 454 BCE were a weakened but not completely destroyed Athenian naval force, the execution of the rebel Inarus, the restoration of Persian power in Egypt, and a strengthened Persian influence on inner-Greek affairs. According to Herodotus (3.15.3), Artaxerxes installed the son of Inarus, and later also Amyrtaeus' son, as their fathers' successors. Thus, the Nile Delta remained under the control of pre-Saïte dynasts (Ruzicka 2012: p. 32), but was politically stabilized and seemed to be pacified. For Artaxerxes I, the

suppression of the revolt was a huge success, but other regions of the empire were still in unrest. It is still a matter of debate whether the satrapy of Transeuphratene revolted two times: Ctesias provides a doubtful account about a revolt led by Megabyzus (§§ 34–42). Also, troubles in Judah, according to the book Ezra (4:7–24), remain a matter of dispute, due to the lack of other sources (Briant 2002a: pp. 578–579).

In the following years, the Athenian foreign policy again challenged the victory of Artaxerxes in Egypt. After the Athenian *strategos* Cimon had returned from his exile, the Athenians ordered 200 ships of the Delian League under his command to set sail against Cyprus. According to Thucydides, 60 ships out of this contingent were sent to support a new revolt in the Nile Delta by Amyrtaeus (Thuc. 1.112.2–3; cf. Libourel 1971: pp. 607–608). Again, the events were only shortly described by Thucydides: after two victories over the Persians, one on sea and the other on land, the troops returned home (Thuc. 1.112.4). The Achaemenid army seemed to be well prepared because their commanders, Megabyzus and Artabazus, brought their naval forces in Cyprus into position. The army stood ready in Egypt and was apparently not defeated. The Delian League's troops failed to meet their strategic objectives because they were neither able to capture the city of Citium in Cyprus nor successfully backup Amyrtaeus. After the Persians' suppression of Amyrtaeus' revolt, the satrapy of Egypt stayed calm during the reign of Artaxerxes I.

After the death of Cimon during the siege of Citium on Cyprus, Athenian strategies against the Achaemenid Empire broke the mold: it was the work of the new demagogue Pericles, who was well aware of the Peloponnesian League as a threat for Athens' imperialistic ambitions. The ongoing conflict with Persia and the huge losses of the Delian League's troops in Egypt as well as Artaxerxes I's ambition to stabilize his empire were factors for both war parties to find an agreement on their spheres of influences. According to Diodorus (12.4.4–5), the Great King as well as the Athenians sent out embassies to negotiate peace. The Athenian ambassador Callias managed to negotiate conditions for the so-called "Peace of Callias" of 449/8 BCE. Yet, the historicity of this peace is debated because Thucydides does not mention it in his *archeologia*. But Herodotus has an Athenian embassy led by Callias (Hdt. 7.151), and Isocrates refers to this treaty as well (contra the historicity: Meister 1982; but see the critique of Meiggs 1984). If we believe Diodorus, the following points came to an agreement (cf. Diod. 12.4.5–6):

- 1) The Persians guaranteed "autonomy" to all Greek cities of Asia.
- 2) The Persian satraps were not allowed to move their troops closer to the sea than a three-day journey, and Persian naval activities beyond the Phaselis and the Cyanean Rocks were no longer accepted.
- 3) In return, the Athenians evinced to stop military interventions against Achaemenid territory.

From the Athenian point of view, the negotiations appeared to be triumphant, but nonetheless the Great King did not give up his claim to Asia Minor (especially to the Greek cities in the west). In fact, the satrap never disclaimed the tributes, thus we cannot see the “Peace of Callias” as any kind of “relief” of Greek cities from Persian power; its character appeared to be more the sort of a truce. Also, the hot spots of war in Egypt and Cyprus were not part of the negotiations. Asia Minor was no longer a scene of war but Athenian and Persian troops continued to fight each other in the south-eastern Mediterranean Sea. Thus, the peace of Callias was neither “the end of Persia’s century-long expansion efforts and the acceptance of boundaries” (Ruzicka 2012: p. 34) nor any kind of bottom of “the long reign of Artaxerxes which had been poor in glorious moments” (Dandamaev 1989: p. 257). Instead, the reign of Artaxerxes I can be viewed as a continuation of Xerxes I’s policy to stabilize the vast multiethnic and multicultural empire. This was also a time of glorious military victories because the Delian League as the only powerful player on the borders of the Persian Empire had suffered heavy defeats by the Achaemenid army. Neither enormous Athenian expeditions nor two revolts could endanger Persian rule in Egypt. Furthermore, it was a major achievement of Artaxerxes to have pacified Egypt and ended the Athenian interventions with a “truce” and without a loss of territory. Moreover, Persian interventions had caused a major inner-Greek conflict, which led Hellas into the eve of the great Peloponnesian War (431–404 BCE). To sum up, there cannot be found any trace of a weak and vulnerable Persian Empire, which, according to a Greek perspective, was in decline at least in the fourth century BCE (Sancisi-Weerdenburg 2002).

Steady State of Empire

In retrospect, we can state that Darius I was a successful usurper who ensured his reign against rebelling local elites and established a new dynasty without the loss of territory. He relied on already existing structures and frames from the times of the Teispid dynasty and accommodated them to create new legitimization strategies. His implemented measures were successful as can be seen in the successful transmission of kingship to his son Xerxes. After the consolidation of power, Darius arranged several marriages to legitimate his reign through dynastic alliances. According to Herodotus’ account we can constitute two marriage strategies: At first, Darius married Cyrus’ daughters Atossa and Artystone, Parmys, the wife of Bardiya, and Phaidyme, the daughter of his co-conspirator Otanes (Hdt. 3.88). Hence, he arranged to create a dynastic legitimization, based on two firm grounds: continuation of the Teispid dynasty through Atossa as mother of the heir apparent, and security for his reign through being tied up with the powerful co-conspirators’ families. Thus,

Darius redressed the legitimacy pressure of his status as a usurper by chaining himself to Cyrus' wife and daughter (Rollinger 1998; Jacobs 2011; Henkelman 2011). It is also striking that Darius and his successors did not marry wives originating from outside of the empire. Marrying exclusively daughters of the interior high elite remained a persistent custom of the Achaemenids until the reign of Darius II, when the first exogamous marriage is attested (Briant 2002a: pp. 589–590). Another innovative way of legitimization was the definition of a specific in-group that exclusively exercised power. Darius calls himself “a man from Parsa” and claims to be of “Aryan descent.” It was the Persian aristocrats who occupied the highest offices (cf. Klinkott 2008: pp. 235–242), thus forming a socially constructed “*éthno-classe dominante*” (Briant 1988a,b; see also Chapter 3 Peoples and Languages). Therefore, the ethnic label “Aryan” was a marker for “nobility” and referred to a “noble pedigree.” Invoking descendancy from a specific *gens* is a unique “ethno-linguistic marker” in Ancient Near Eastern strategies of legitimation and can be seen as typically Achaemenid (Rollinger 2017: p. 201). The acceptance of the Achaemenids as a new dynasty can be seen in Xerxes' referring to Darius as his father. This means that the lack of a genealogical connection to Cyrus and Cambyzes was consciously redressed (Curtis, et al. 1995: pp. 150–151).

Another point of Darius' policy to consolidate his acquired power was to create a special relationship with his eminent co-conspirators, in order to maintain his superior position. Several passages in Herodotus' *Histories* exhibit the pertinent danger that representatives of the new imperial elite might become too powerful. Herodotus hints at these potential conflicts through accounts about cruel punishments (cf. the record of human violence in Rollinger 2010: pp. 590–598, Degen 2020). Yet, Darius presented gifts to his loyal followers and lifted them into higher imperial offices (cf. the story about Zopyrus and his son Megabyzus in Hdt. 3.153; a collection of sources is provided by Briant 2002a: p. 128, cf. Chapter 73 Banquet and Gift Exchange). Darius I explicitly proclaims in his monumental inscription of Bisitun to protect the lineages of his six co-conspirators (cf. DB op. § 68). Apparently, Darius' reign was embossed by a dialogue between the ruler and a well-defined elite class, thus establishing a balance that guaranteed his unrivaled status as usurper-king.

After Darius' death, his son Xerxes became king without any intricacies, although Xerxes had an elder brother. It occurs that Xerxes, as son of Atossa, was viewed as the only legitimate prince. This recalls Darius' marriage strategy intending to install an unrivaled heir to the throne. Xerxes' “birth-in-purple” (Briant 1991) is presented by Herodotus as a conflict with the other sons of Darius (Hdt. 7.2). However, a document from the Persepolis Archive illustrates that already 12 years before Darius' death ^{Hal}*šēir-šá*, Elamite for

Xerxes (see PFT NN 1657 in Rossi 2012: p. 454), held a high office. Hence, Xerxes was long prepared to become his father's successor.

The fact that Xerxes succeeded his father to the throne without vast rebellions or being challenged by a usurper clearly demonstrates how efficient Darius' strategy of legitimation worked out to be. Even the murder of Xerxes I in 465 BCE by his own son, probably the later Artaxerxes I, highlights that the Achaemenids ruled the empire without rivals out of other elite families (for the various identifications of Xerxes' murderer: cf. Wiesehöfer 2007 for the classical traditions; for the Astronomical Diaries cf. Kuhrt 2007: p. 306). It is true that internecine intrigues continued to trouble the Achaemenids until Alexander's invasion of Asia, but all further kings derived from their family (Rollinger 2014b; Briant 2002b; Thomas 2017).

It is the analysis of historical processes in a wider comprehensive framework, provided by the unequal information of indigenous and classical sources, that offers an idea of the achievements of the reigns of Xerxes I and Artaxerxes I. The royal inscriptions exhibit a Persian king Xerxes, who continued his father's works and thus further developed the Persian conception of a perfect and successful Achaemenid king (Sancisi-Weerdenburg 2002: p. 558).⁶ Meanwhile, Herodotus provides "insight on the Greek vision of an eastern monarch" (Sancisi-Weerdenburg 2002: p. 558). This monarch is presented as an Asian despot who is on the one hand caught in the course of history and on the other hand struck by blindness toward divine borders.

Court and Architecture

Our sources about the court and court ceremonials derive from Greek authors and are clouded by their worldviews. Through Greek lenses Achaemenid court ceremonials served to underline the *topos* of Asiatic despotism and to exemplify the alleged divine character of the Achaemenid king through a misunderstanding of the court protocol (for the *prokynesis*, a specific gesture of greeting to be performed by visitors to the king, see Rollinger 2012). The empire's center was not strictly situated in a certain capital, the Achaemenids were itinerant kings, traveling between the residences Persepolis, Susa, Ecbatana, and Babylon (Tuplin 1998; Briant 1988a,b). These centers were built and largely dismantled by the first three Achaemenids. Shortly after his consolidation of power Darius ordered the building of a palace at the foot of the Kuh-e Ramat mountain. This complex was called Pārsa in Old Persian and *Persepolis* in Greek. Xerxes vastly enlarged this palace, whereby it mostly became the structure of its modern appearance (Jacobs 1997). On the basis of royal inscriptions, we can obtain some information about Darius I's, Xerxes I's, and Artaxerxes I's building programs in these residences. The proclamation

that the buildings of the predecessors were enlarged became a constant element of the building charters of Xerxes I. The Great Kings used the specific knowledge and resources of their subjects and lands to represent the multicultural character of their empire through the physical appearance of their palaces (Rollinger 2008). Apart from this, new inventions in the funeral architecture were made during Darius' reign. The so-called gabled hut tomb – the style of Cyrus' tomb at Pasargadae – was replaced by the rock-cut tomb type, a form which became programmatic for all later Achaemenids (Jacobs 2010). The rock at Naqš-e Rostam was chosen as the new gravesite for the kings, which brought the monumental Achaemenid rock relief sculpting into the Persian heartland (Canepa 2014: pp. 56–59).

Some Concluding Remarks: Changes and Achievements

Reviewing the reigns of Darius I, Xerxes, and Artaxerxes I in a more general way, it becomes apparent that the empire faced some important structural changes during this period. Expansion came to a halt and the imperial forces were concentrated on maintaining and systematically administering what had been conquered. The tax system was slowly but consequently reestablished and a more direct rule was organized where Persians started to play a more and more crucial role. At the same time, the new dynasty that was founded by Darius in a dramatic civil war was firmly established by his son and grandson and never questioned again (Wiesehöfer 2007). These changes also affected the royal ideology as becomes manifest in the royal inscriptions. Since conquest had come to an end, history as a sequence of events also begins to disappear from Achaemenid royal inscriptions. What we see is a static empire that ruled the world safely guided by its Great Kings with a special relationship to the gods (Rollinger 2014a). Revolts could not change this perspective. Egypt remained a place of some unrest, whereas Babylonia was definitely pacified in the reign of Xerxes. This has nothing to do with exceptionally harsh Achaemenid responses in Babylonia as compared with Egypt. It is striking that the permanence of Egyptian unrest in Persian times recalls the ongoing Babylonian resistance toward Assyrian occupation. This similarity is probably due to geographical and geo-strategic circumstances. Egypt was a Persian periphery as Babylonia was an Assyrian one. Babylonian resistance was always powered by Elam, which was beyond Assyrian reach. This favorable location of Babylonia came to end in Persian times, whereas Egypt still had the advantage of being a peripheral zone that kept resistance alive from the fifth to the fourth centuries BCE. Although the Achaemenid dynasty was firmly established with the reigns of Xerxes and Artaxerxes I, and was not challenged again until the emergence of Alexander III, the same stability does not apply

for succession within the Achaemenid family. Xerxes was chosen as heir apparent, although he was not Darius' eldest son. He was murdered in 465 BCE, a fate shared by Artaxerxes III (338 BCE), Arses (336 BCE), and Darius III (330 BCE). This instability within the Achaemenid family, however, did not affect the stability of the empire, which remained for about 150 years one of the largest and most successful superpowers in world history.

NOTES

- 1 At the same time, however, he was clever enough to use the citizens' desire for political participation for his own affairs.
- 2 Out of about 1000 Greek poleis known so far only about 30 constituted the "Hellenic League." The supreme command of its naval and land troops fell to Sparta.
- 3 Darius I as a usurper and Xerxes as founder of a new dynasty apparently had an additional need to bolster their legitimacy.
- 4 Note that at the end of the fifth century BCE Greek intellectuals were still very well aware that victory over the Achaemenid Persian Empire was much more due to Persian failure than to Greek military achievement. For this is exactly what the Corinthians highlight in their famous speech addressed to the Lacedaemonians accusing them for their inactive policy toward the aggressive Athenians: "Yet you know that the Barbarian failed mostly by his own fault..." (Thuc. 1.69.5. by Loeb).
- 5 However, one may doubt whether modern quantity theory of money can also be applied to Babylonian hacksilver.
- 6 For Artaxerxes I barely any inscriptions have been preserved.

CHAPTER 32

From Darius II to Darius III

Carsten Binder

Darius II (423–405/4 BCE)

The beginning of the reign of Darius II exemplifies the problems that beset the historical study of the Achaemenids. We have, on the one hand, the very scanty indigenous historical tradition from within the territory ruled by the Achaemenids and, on the other, an apparently detailed and well-informed historical tradition transmitted by Greek authors. The value of this Greek tradition, however, continues to be overestimated today. In most cases, it is unclear where Greek authors have obtained their information; they purport to relate some of the most intimate happenings at the king's court; yet at the same time, when describing the simplest scenes, they make serious mistakes or show significant gaps. Scholars are generally reluctant to engage these sources critically and frequently attribute such errors to the authors' informants or to misunderstandings. But since these sources consist mostly of stereotypical descriptions of the court of the Great Kings with recurring romantic elements (Wiesehöfer 2011), a fundamental skepticism of these sources should be the dominant approach. Even when these accounts correctly record banal details or even the names of high noblemen, a handful of apparently historically correct data by no means permits us to conclude that the overall narrative is accurate.

Translated from German by John Noël Dillon.

A Companion to the Achaemenid Persian Empire, Volume I, First Edition.

If we examine the few surviving sources from within the Achaemenid Empire, the succession of Darius after the death of his father, the Great King Artaxerxes I, went smoothly. That last secure date from Babylonian sources connected to Artaxerxes comes from the last third of December 424 BCE. Babylonian scribes likewise set the beginning of the reign of Darius II in the eleventh Babylonian month: at least according to these scribes, Darius was reigning by mid-February 423 BCE. Accordingly, the transfer of power must have taken place between December 424 and February 423 BCE (Stolper 1983; Depuydt 1995).

Since the legitimate successor first had to observe an empire-wide period of mourning, during which certain duties, such as the burial of his predecessor, had to be performed, a date of December 424/January 423 BCE for Artaxerxes' death and the accession of Darius perhaps a month later is not surprising. Since Artaxerxes I lived to an advanced age, one may assume that the legitimate heir had been designated by his father long in advance. Nothing in these sources testifies against a smooth transfer of power from Artaxerxes I to Darius II.

The Greek tradition presents a different picture; more precisely, the influential Greek author Ctesias, who directly or indirectly is the ultimate source of all other Greek texts. According to Ctesias, after the death of Artaxerxes I, his only legitimate son, Xerxes, ascended the throne (thus becoming Xerxes II); this succession was rejected by some of Xerxes' half-brothers, and so after only 45 days Xerxes was murdered by his half-brother, Secyndianus. This Secyndianus, who on account of methodologically problematic source contamination is also known as Sogdianus in the scholarly literature (Schmitt 2006: pp. 272–276), will have ruled 6 months and 15 days before yet another half-brother, Ochus – the future Darius II – had him removed under suspicious circumstances (Ctesias F14 [46]; F 15 [47–50]).

If one assesses the relative merits of these two strands of the tradition, the fact that the non-Greek sources know nothing of either a Xerxes or a Secyndianus/Sogdianus should tip the balance. The chronology of the Babylonian scribes is very reliable, and so we are forced to ask how they could have dated documents to the reign of Darius II as legitimate king already in February if Xerxes and Secyndianus had held power at least until June or July 423 BCE. Scholars in favor of Ctesias' reliability frequently cite the fact that his history fairly accurately records the names of noblemen who are attested as politically powerful persons in Babylonian economic texts. It is methodologically unsound, however, to assume the historicity of the entire narrative on the basis of such details and then to interpret other sources according to the Greek tradition. Circular reasoning is the result: because the Babylonian texts apparently support Ctesias, the purport of the economic texts is then, with interpretive effort, established on the basis provided by Ctesias. The usurpation described only by Ctesias thus

becomes historical reality. In light of the demonstrably romantic character of Ctesias' *Persica*, mere homonymity does not warrant such an optimistic approach. Besides the fact that identity of name does not automatically mean identity of person, it is precisely for persons ranking very high in the hierarchy, whose degree of famousness we cannot now establish, that simple homonymity does not suffice for far-reaching conclusions. Whoever, then, has first Xerxes II and then Secyndianus/Sogdianus follow Artaxerxes I before listing Darius II should know that he does so on very tenuous evidence.

The sources for the actual reign of Darius II are hardly better. Some scraps of information from Babylonia exist in the Murašû Archive and astronomical records. These lack context, however, and thus do not convey a coherent picture. They only cast spotlights on isolated events such as the mustering of troops in the city of Uruk. Some documents in Aramaic from Egypt give us a glimpse of conditions in this satrapy. Isolated Greek notices, without echo in the indigenous tradition, tell of wars against the Pisidians and Cadusians, who are virtually stereotypical enemies of the Great Kings in Greek texts, but the dubious provenance of these stories does not permit us to sketch Persian foreign policy in any detail.

Besides the fragments of Ctesias, which report mainly palace intrigues, attempted usurpations, and punishments at the court, and deserve from little to no trust, more valuable accounts are available from Thucydides and Xenophon. Here, however, the focus lies on the Peloponnesian War. Persian policy plays a part only in the conflict with the Greeks in western Asia Minor. The protagonists on the Persian side are the satraps Tissaphernes (Lydia) and Pharnabazus (Hellespontine Phrygia). Not until the usurpation of the Carian dynast Amorges (413 BCE, Thuc. 8.54.3) with Athenian support did the Persian king intervene in the conflict through his satraps. The Persian claim to the *poleis* of western Asia Minor, which was probably never abandoned, was again expressed in demands for tribute. Even when Tissaphernes subsequently made treaties with Sparta, though, no consistent Persian policy in the conflict is discernible before 407 BCE. This should by no means be ascribed to the Great King's supposed ignorance of the events. Many other factors may have played a part. Besides the fact that we have no information about conditions in the rest of the empire (where much more important events may have been underway from the perspective of the Great King), the status quo in the west was very advantageous. Both of the most powerful satraps were locked in competition with one another, which kept both of them under control. Athens, previously the King's most powerful opponent in the region, and Sparta paralyzed one another, so that the Delian League's sphere of influence became vulnerable. The conflict in the west might also have been seen as a regional problem for the satraps that required only a limited response from the administrative center of the empire. The perception of the scale of the

conflict conveyed by Thucydides need not have been shared by non-Greek contemporaries. That the necessary resources for large-scale operations had been available to Darius II is illustrated by the shift in Persian policy in 407 BCE.

Only then did the royal court show a clear interest in the peripheral conflict taking place in politically and economically significant territory of western Asia Minor. Cyrus, one of Darius II's sons (known in Greek literature as Cyrus the Younger), was made satrap of Lydia, Greater Phrygia, and Cappadocia, as well as *karanos* (Supreme Commander, Xen. Anab. 1.1.2; Xen. Hell. 1.4.3) of western Asia Minor. This important appointment should probably be interpreted as compensation for the elevation of his brother Arsēs (later regal name: Artaxerxes) as designated heir, which took place at the latest in 408/7 BCE. Plutarch's description of a later designation of the heir on Darius II's deathbed (405 BCE) should not be considered historical.

The ostensibly ambitious Cyrus pursued a consistently Sparta-friendly policy, undoubtedly with his father's knowledge. The significant increase in subsidies for Sparta gave the Greek polis a decisive advantage in its resource-draining war with Athens, which was decided at the battle of Aegospotami in 405 BCE. Athens lost almost its entire fleet and was cut off from important supplies from the Black Sea region.

Artaxerxes II (405/4–359/8 BCE)

The actual succession of Artaxerxes II after the death of Darius in 404 BCE appears to have gone smoothly. Yet Plutarch, whose remarkable biography of Artaxerxes II is an eloquent but hardly reliable source of information (Binder 2008), reports an assassination attempt by Cyrus during the coronation in Pasargadae. But this account (and all the details about the coronation itself: Binder 2010), as indeed all references from the *Persica* literature of the fourth century BCE, should be treated with the greatest caution. The fact alone that Cyrus was retained in his position as satrap of important provinces after 404 BCE shows that the allegations against him could at least not be proven.

Artaxerxes' reign was marked by unrest and fighting for the preservation of the unity of the empire. He was forced to accept the eventual loss of Egypt probably between 404 and 399 BCE. During the same period, Cyrus the younger made an attempt to usurp the throne, immortalized in Xenophon's *Anabasis*. With the aid of indigenous troops and about 13 000 Greek mercenaries, among them Xenophon, Cyrus made a daring attack on his brother's rule. The decisive battle between the two brothers was fought near Cunaxa in Babylonia (Plut. Art. 8.2.). Cyrus' usurpation failed as he lost his life in the battle, but his Greek mercenaries were victorious. Xenophon's *Anabasis* is primarily dedicated to the events after the battle, describing the heroic return

of the Greeks from the heart of enemy territory. It is because of his account (and less directly the *Cyropaedia* and *Agesilaus*), and because of the statements of other authors (especially Isocrates), that the Persian Empire appears to have been in a steady decline, reaching its nadir under Artaxerxes II. This model of Persian decadence has enjoyed great popularity from antiquity to modern scholarly works, but it can scarcely be maintained. It is undeniable that the reign of Artaxerxes II was shaken by a series of domestic and foreign conflicts and crises. But nearly all of these were successfully overcome. The fact alone that Artaxerxes II reigned longer than any other Achaemenid ruler should serve as a measure of his reign's success. The record of his political achievements confirms this impression.

Although he had supported Sparta in the struggle against Athens, the Great King found himself confronted by an aggressive Spartan policy in western Asia Minor at the beginning of the fourth century (c. 400–394 BCE). Artaxerxes endured military setbacks first under the Spartan commander Thibron and then under the general Dercylidas. Spartan efforts to “liberate” Greek *poleis* from the Persian yoke picked up speed under King Agesilaus from 396 BCE. His recall to Greece despite military successes in Asia Minor (victory at Pactolus in 395 BCE) must be connected to the financial support that *poleis* hostile to Sparta (Athens, Thebes, Corinth, Argos) received from the Great King. Our fragmentary sources make it impossible to determine how decisively these subsidies influenced the declaration of war on Sparta in Greece. There is no doubt, however, that the Persian Great King supported Sparta's opponents in the so-called Corinthian War (395–386 BCE). The construction of a Persian fleet under the command of the Athenian Conon from 397/6 BCE should be viewed in this context. The venture was crowned with success: in 394 BCE, at the Battle of Cnidus, the largest Persian naval victory since the Athenian defeat in the Nile delta in 454 BCE, Sparta lost much of its fleet and with it the means of operating in Asia Minor. Within a few months of the Battle of Cnidus, most *poleis* of Asia Minor had driven out the Spartan harmosts and placed themselves under Persian authority (Xen. Hell. 4.8.1–3; Diod. 14.84.3f.). Already by 394 BCE, the status quo prior to the successes of the Delian League in the 470s BCE had de facto been restored. The Persian fleet under Conon subsequently advanced as far as Corinth. It was the largest Persian naval operation off the Greek coast in 80 years. To call this a high point of Achaemenid power is fully justified (Briant 2002: p. 645). The Great King was a leading figure on the political stage of mainland Greece.

Only after Athens had supported the rebellious Euagoras of Cyprus in his efforts to extend his rule over all of Cyprus and thus confront Artaxerxes II himself did the Great King again help Sparta in a largely internal Greek conflict.

The powerful role played by the Persian Great King is illustrated clearly in the so-called “King's Peace” (387/6 BCE). On the one hand, the Great King

appears as mediator and guarantor of a peace treaty among Greeks that ended the Corinthian War and initially strengthened Sparta's position in Greece. On the other, Persian claims to rule over Asia Minor and Cyprus are confirmed (Xen. Hell. 5.1.31; Urban 1991: pp. 101–125; Jehne 1994: pp. 31–47). Thus the status quo prior to 479 BCE and the military successes of the Athenian League were restored. The variety of political and military means deployed by the Great King suggests complex strategies of action and points to the large, even inexhaustible, resources of the empire; in no way does it indicate military weakness (Wiesehöfer 2006: p. 37). It is no surprise that the Greek sources from this period reiterate the general weakness of the Persian Empire: they saw themselves as contemporaries to the Persians' constantly growing political and military influence even in internal Greek controversies. The tendentious character of Greek sources derives rather from literary embellishment than from a realistic representation of this situation.

The sources for the late reign of Artaxerxes are even worse. Primarily Diodorus Siculus and Plutarch preserve the tradition, who, besides Ephorus and Dinon, perhaps made use of an otherwise unknown work by Heracleides of Cyme and authors even more obscure to our view (Plut. Art. 21.2). Exactly as with Dinon, these authors should be considered continuators and rivals of Ctesias. For example, the accounts about the Great King's campaigns against the Cadusians in Plutarch and Diodorus are literary doublets, one account dependent on the other. Plutarch merely gives a slightly different version of the campaign Diodorus records for the year 385/4 BCE. The elaboration of literary constructions which do not correspond to our understanding of the representation of historical reality is typical of *Persica* literature, if not for fourth-century historiography generally. Scholars thus have few and often no means of determining the historicity of the campaign mentioned (Binder 2008: pp. 316–321). There is no denying that Artaxerxes II suffered a series of setbacks. Thus his attempt to recover Egypt in 374/3 BCE failed (Van der Spek 1998: pp. 251–252). In Asia Minor, the Great King faced a series of revolts from satraps within the empire, which have been described in earlier scholarship, on the basis of Diodorus (15.93.1), as the “Great Satraps’ Revolt.” Indeed some satraps, such as Datames (Cappadocia), Ariobarzanes (Phrygia), and for a time the famous Mausolus (Caria), rebelled against the Great King with military force. Modern research, however, has greatly qualified the threat to the empire that this rebellion actually posed (Weiskopf 1989), especially in light of the conflicting interests among the rebellious satraps and their lack of a coherent strategy. Artaxerxes II was ultimately able to subjugate all the satrapies in question.

The historical content of information about court matters in the late reign of the Great King is again impossible to determine. Artaxerxes' designated heir Darius, together with the noble Tiribazus, is supposed to have rebelled against his father after a quarrel over a woman. The usurpation attempt was

thwarted and the heir apparent executed (Plut. Art. 26–29). The ensuing contest over the succession was fought out among three other sons. Through intrigues against his brothers, Ochus, the future Artaxerxes III, ultimately survived and thus succeeded to Artaxerxes, who, now worn down by sorrow, died at an advanced age. Diodorus knows none of these details. According to him, Ochus succeeded his father seamlessly (Diod. 15.93.1). Obviously, the succession and transfer of power are always sensitive points that can lead to great problems. Yet, as already seen in the succession of Darius II to Artaxerxes I, beyond the mere existence of the Greek account no evidence for the historicity of these events can be found. The existence of a parallel tradition in Pompeius Trogus/Justin should not mislead one into attributing a high degree of credibility to these accounts: with high probability it is not an independent tradition. A source-critical analysis does not operate with quantitative criteria. The quality of an account does not improve merely because it is repeated and reworked significantly later. Trogus, who lived long after the events, naturally turned to the *Persica* literature for his depictions. In contrast to the tradition that Plutarch preserves, he reports that Artaxerxes III took drastic measures to preserve his power after succeeding to the throne (Just. 10.3). The origin of these stories is utterly obscure to us in many respects. The historical value of their detailed depictions of intrigues, conspiracies, acts of violence, and the excesses of the court should, despite the seductiveness of allegedly insider information, be set very low.

One aspect of the religious policy of Artaxerxes II creates significant difficulties for scholars. Until Artaxerxes II, inscriptions from the time of Darius I mention anonymous gods alongside Ahuramazda, who takes preeminence (e.g. DB §62). First Artaxerxes II revokes this anonymous status. Alongside Ahuramazda, he mentions the goddess Anahita and the god Mithras (e.g. A²Sa). He thus introduces these previously nameless gods into the public-political area and simultaneously reduces the exclusivity of Ahuramazda, who nonetheless occupies a dominant position in the inscriptions also under Artaxerxes II. The Babylonian historian Berossus, moreover, preserves an edict of Artaxerxes according to which he ordered that statues of Anahita should be erected throughout the empire (Berossos, FGrH 680, F 11), thus establishing a statue cult. Artaxerxes is recorded as the builder in at least Ecbatana, Susa, and Babylon. There is little scholarly consensus as to how these measures should be interpreted. As so often, the sources permit us only either to indicate problems or to relate hypothetical events.

Artaxerxes III (359/8–338 BCE)

Despite Plutarch's account, Ochus/Artaxerxes III appears to have succeeded his father without any notable conflict between November 359 and April 358 BCE, according to dates preserved in Babylonian tablets. Already in 361 BCE,

his father had put him at the head of significant forces to fight against the rebellious satraps and the Pharaoh Tachôs (Sync. p. 486f.). There is no convincing evidence that Artaxerxes II did not trust his son, as Plutarch claims. Also in this case, it seems that the succession was determined well in advance.

Artaxerxes III stands in a bad light both in many ancient accounts and in modern criticism based on them. Plutarch even claims that Artaxerxes surpassed all other Great Kings in cruelty and bloodthirstiness (Plut. Art. 30.9). Diodorus Siculus reports that Artaxerxes plundered and destroyed temples in Egypt and extorted money from the priests (Diod. 16.51.2). A famous example for the supposedly sacrilegious behavior of Artaxerxes is connected to the recovery of Egypt in 343 BCE: after the conquest, the Great King allegedly had the sacred Apis bull slaughtered so he could eat him (Ael. var. hist. 4.8; Plut. mor. 355C). A very similar misdeed is also attributed to the first conqueror of Egypt, Cambyses. In both cases, the foreign aggressors are supposed to have abused local cults with extreme acts of sacrilege and intolerance. Such behavior, however, stands in complete contradiction to the rest of Achaemenid policy of conquest, which normally preserved and even promoted local cults in order to facilitate the exercise of power on the ground. Scholars thus consider the slaughter of the Apis bull an invention of Egyptian priests to damage the reputation of the conquerors (Mildenberg 1999).

At the beginning of his reign, Artaxerxes III had inherited unresolved conflicts in Asia Minor left over from his father's reign. During the years 356–352 BCE, he struggled against the satrap Artabazus (Hellespontine Phrygia), who according to Diodorus received support first from the Athenian *strategos* Chares and then from the Theban Pammenes (Diod. 16.7.3–4; 21–22.1–2; Moysey 1975: pp. 295–317). The Great King ultimately succeeded in bringing the renegade satrapies under control, so that Asia Minor at this point was consolidated under Achaemenid rule. Much about this rebellion is unclear. Artabazus inexplicably is said to have taken refuge with Philip II of Macedon.

The simultaneous attempt to recover Egypt appears to have backfired; at any rate, we know practically nothing about this expedition. Renewed preparations for an Egyptian campaign were again interrupted by rebellion in Phoenicia, beginning with Sidon under King Tennes. The real causes of this rebellion are, as so often, mysterious, despite the at times detailed account of Diodorus. Various kings on Cyprus also revolted. The Egyptian pharaoh Nectanebo supported the uprisings, but Egypt's part in the outbreak of the revolts is hard to determine. The struggle between the rebels and the satraps of the Great King progressed with varying fortune. Artaxerxes III was initially able to advance from Babylon against Sidon with a large army and – allegedly through Tennes' treachery (Diod. 16.43.1–45.6) – take the city and end the revolt with his execution (345 BCE). Thereafter, further Phoenician cities supposedly submitted to the Great King. Yet there is no evidence that cities

other than Sidon had been actively involved in the fighting. Shortly afterward Cyprus was also brought back under Achaemenid control.

The pacification of these flash points enabled Artaxerxes III to attack his original goal, Egypt. The king's army marched from Phoenicia to Egypt and conquered the country in 343/2 BCE. Artaxerxes thus ended roughly 65 years of Egyptian independence from the Achaemenid Empire. He succeeded in restoring the empire nearly to its borders under Darius I, so that one might say he had successfully continued his father's policy. By the middle of the fourth century, the Achaemenid Empire was at the height of its power. Our primary source for all of these events is essentially Diodorus: even though his account is quite detailed, the motives of the actors are frequently unclear.

The Transition to Darius III

While scholarly analysis – though not our Greek sources – demonstrates that the reigns of Artaxerxes II and III were highpoints of Achaemenid power, the rapidly ensuing succession crises after Artaxerxes III's presumably violent death suggest that the empire entered a period of considerable weakness. The conquest of the Achaemenid Empire by a foreign enemy (Alexander) almost seems logical in this context. Diodorus relates the end of Artaxerxes: The hated king was allegedly poisoned in 338 BCE by one of his confidants, the eunuch Bagoas (Diod. 17.5). Bagoas had risen to power under Artaxerxes III and – again according to Diodorus – had both commanded forces during the conquest of Egypt and had held a vital leadership position afterward in the “Upper Satrapies.” Most of Artaxerxes' family members perished with him, with the exception of his youngest son, Arses, whom Bagoas placed on the throne as Artaxerxes IV. When Arses/Artaxerxes proved not as easy to manipulate as Bagoas had anticipated, and even planned his removal, Bagoas had him murdered two years later (336 BCE) and placed Darius III on the throne. According to Arrian, in his correspondence with Darius III after the Battle of Issus (333 BCE), Alexander claimed that Darius had arranged the murder of Arses/Artaxerxes IV (Arr. 2.14.5) with Bagoas and had no legitimate claim to the throne. In the Greek tradition, the rule of the Achaemenids ends with Arses/Artaxerxes (Diod. 17.5.5). Diodorus, however, preserves another version in which Darius (Justin/Trogus calls him Codoman, Just. 10.3.4) supposedly received great honors from Artaxerxes III during the wars against the Cadusians for proving his personal worth (Diod. 17.6.1–3). Scholars conjecture that both these versions are related. But while the first version (Alexander's letter) definitely may have been influenced in some manner by Macedonian propaganda, it is uncertain whether the second version represents a genuinely Persian reaction (counterpropaganda) to it (Briant 2002: 770f.). More

probably this account is purely Greek in origin. Why should Persian propaganda counter Alexander's allegations by praising Darius' heroic deeds if the claim he is not descended from the royal line is patently false? Who is the intended addressee of this counterpropaganda? Even Diodorus knows that Darius is the son of Arsanes and grandson of Ostanes, thus the brother of Artaxerxes II (Diod. 17.5.5), something that scholars do not dispute. After Ochus' death, Darius was a legitimate heir to the throne, and his claim was not seriously contested later. Moreover, it is highly implausible that Bagoas alone was the driving force and "kingmaker" behind all these revolts. As so often, the one-sided tradition (even if there are different Greek versions, the question remains where the Greeks got their information about the most intimate details of the king's court) prevents us from drawing a convincing picture beyond merely sketching the sources. The murder of Artaxerxes III may have been the work of opponents of a hated king, and the prominent person Bagoas merely the means with which the Greek sources tell the tale with appropriate excitement. But the succession of Darius II to Artaxerxes I should show us that Greek authors were perfectly capable of inventing events. The historicity of Bagoas as a powerful figure at court cannot be doubted. That he alone, however, staged the elevation of kings at his discretion is inconceivable. When the same Bagoas then attempted to eliminate also Darius III by poison in 336 BCE, the Great King forced him to drink the poison himself (Diod. 17.5.6). The episode perfectly fits the Greek picture of the anarchy and instability at the Persian court, which is characteristic of the Greek image of the Persians, but it is no reliable evidence for the Achaemenid court.

Darius III (336–330 BCE)

As with the transition period, the sources for the brief reign of Darius III are dismal. Besides the Greek sources, the main goal of which is to put the deeds of Alexander in the best possible light, there is virtually no indigenous tradition in any form. Darius III thus appears exclusively as Alexander's cowardly and incompetent opponent. There are few traces of him in Babylon and these tell us little, for example the date of the battle of Gaugamela or mention of Darius' name (Sachs 1977). For Artaxerxes II, and to a much lesser extent Artaxerxes III, we could at least make use of other sources than Greek texts. The scarcity of sources for the last century of the Achaemenids is especially problematic here.

After Philip's victory at Chaeronea (338 BCE) and the foundation of the Corinthian League, the Achaemenid Empire again faced an aggressive Greek-Macedonian policy in its western satrapies. The first expeditionary force reached Asia Minor in 336 BCE. We have little information about the precise

actions of this landing, which undoubtedly served as preparation for a larger invasion. Military action was taken in Asia Minor even after Philip's murder and Alexander's accession. The Persian counteroffensive was led mainly by Memnon of Rhodes (this, at any rate, is the impression given in the Greek sources, e.g. Diodorus). Like other Greeks, Memnon fought as a mercenary or mercenary leader for the Great King. We have no information about the actions of the satraps, but it is scarcely conceivable that they did not take part in the fighting. It is a well-known stereotype of Greek sources, though, that successful attacks on Greeks are made only by Greek mercenary leaders and not by Persian commanders. Memnon achieved great success and beat back the Macedonian forces. In 334 BCE before Alexander's invasion, only Abydus remained under Macedonian control (Arr. 1.11.6). Early in 334 BCE, Alexander crossed the Hellespont with his army and swiftly took up position on the Granicus. A Persian army under the command of satraps and generals took up position at Zeleia (Arr. 1.12.8–10). Memnon's plan to leave scorched earth in Alexander's path and to bring the war to Greece and Macedonia as quickly as possible, in order to cut off Alexander's supplies, was rejected (Arr. 1.12.8; Diod. 17.18.2–4; Curt. 7.4.3f.). The tradition on these matters is so tendentious and favorable toward Memnon that clarity is impossible. The entire war council could be an invention, and the satraps' motives can no longer be recovered. Scholars attribute the satraps' hesitation to sacrifice their land to devastation to Achaemenid imperial ideology: the king or satrap is the gardener of the empire, who must provide for the good of the land (Wiesehöfer 1994: p. 28).

The Battle of the Granicus (334 BCE), in which Alexander was victorious, was no devastating defeat from the Persian perspective because the losses were not very high. According to Arrian, 1000 cavalry and some high Persian commanders fell (Arr. 1.16.2). Yet Alexander subsequently succeeded in bringing large swaths of western Asia Minor gradually under his control, without being threatened by a Persian army. He merely had to break the resistance of individual cities that refused to welcome him as liberator. Alexander was unable to take Halicarnassus and Myndus in this way. Resistance was offered by Persian garrisons still on site (e.g. Miletus), but the Persians suffered bitter losses (e.g. Sardis) such as they had never seen in the long history of Greek-Persian conflict. We unfortunately have no information about the Great King's court, since the focus of the Greek accounts is on Alexander. After the defeat at the Granicus, though, Memnon was made general in Asia Minor and commander of the fleet. Alexander may have attempted to compensate for the inferiority of his naval forces by conquering Persian naval bases. It is doubtful whether such a plan ever existed, however. Given ancient conditions and the limited manpower available to Alexander, it would have been impossible to keep the Persian fleet from the entire Ionian coast. Memnon appears – in the account

of Diodorus and Appian – not only to have planned attacks on the Ionian coast but also to have followed up the plan to transfer the war to the Greek motherland. This might have inspired Athens, Sparta, and Thebes with hope of throwing off the Macedonian yoke. At the time of Memnon's death (he perished during the siege of Mytilene) in the summer of 333 BCE, though, nothing of any such strategy was to be seen. Command of the fleet was not abandoned but rather given to the Persian commanders who successfully conquered Mytilene. Darius III meanwhile was preparing a ground offensive and raised an army under his personal leadership. Alexander attempted to come within striking distance of Phoenician cities as quickly as possible. Darius must have perceived his plan, because he likewise rushed to cross the Taurus and reach Phoenicia with great speed. In November 333 BCE, both the Great King and Alexander met directly in battle for the first time. The famous Battle of Issus ended in a catastrophe for the Persians, despite their marked numerical superiority. A Macedonian assault under Alexander on the Persian center with the goal of eliminating the Great King himself led to his flight from the battle, which is naturally characterized as cowardice by Greek authors. The preservation of Achaemenid power was bound up in his personal survival, however, whether for the preservation of order (Wieshöfer 2006: p. 39) or from pure pragmatism, since a power vacuum would have been created after his death without a recognizable legitimate heir. The Persian army was demoralized after the flight of its commander and retreated. Alexander captured not only great riches but also members of Darius' family. Whether these hostages prevented a further attack by Darius or whether he hoped to raise troops for a longer period of time is impossible to say. At any rate, Darius entered negotiations with Alexander, in which he ultimately proposed surrendering territory up to the Euphrates, but Alexander rejected all such offers.

The Great King did not hinder Alexander's march over Phoenicia and Syria to Egypt but rather used the time to raise greater numbers of troops and apparently waited until Alexander would attack. Alexander crossed the Euphrates in summer 331 BCE and the Tigris soon after. Darius III offered Alexander a decisive battle north of Arbela (Arbil, today in northern Iraq) on the plain of Gaugamela, which Alexander accepted (October 331 BCE). The Persian army was numerically superior and the battlefield well suited for Persian troops. Alexander's advantage, however, lay in the shock force of his well trained and, after several years of campaigning together, well-coordinated soldiers, who proved superior in the battle. Again, as at Issus, Alexander allegedly made a daring direct attack on the center of the Persian forces in order to encounter the Great King directly. Darius was again forced to flee, despite the fact that the battle had gone largely in his favor. Just as after Issus, a second Persian army assembled from throughout the empire had been utterly defeated, so that the resources of the Achaemenid Empire were certainly

strained. Darius' inability to secure a victory may also have called his legitimacy into question (Wiesehöfer 1998: pp. 58–59). The subsequent capture and murder of the Great King in retreat before Alexander's advance by the satrap Bessus (July 330 BCE), who – as a member of the Achaemenid dynasty – proclaimed himself Darius' successor (Artaxerxes V), were ultimately the consequences of this multitude of failures.

Alexander and his troops reached Babylon and took Susa without resistance. He then pushed into the Persian heartland toward the important Achaemenid residences Persepolis and Pasargadae. Darius could not stop his advance and was forced to flee ever further east before Alexander. The Greek authors embellish Darius' end (Diodorus knows a version in which Alexander encounters Darius clinging to life and promises him revenge on Bessus). Most of these stories appear to have no historical basis whatsoever.

Alexander is supposed to have buried Darius III in the royal crypt in Persepolis as an act of reverence (so e.g. Arr. 3.22.1–2). The site of the grave has not yet been identified. Even if we lack reliable information on the details, Alexander nonetheless seems to have been concerned to represent himself as successor to the Achaemenid kings.

Achaemenid rule ended with the death of Darius III. Bessus established a kingdom in several eastern satrapies. In the course of Alexander's conquest of these areas, Bessus was captured and delivered to Alexander (Arr. 3.28–30; 4.7.3). After Alexander ordered the usurper to be mutilated (again playing the part of the legitimate successor), Bessus was delivered to the son of Darius III, who ordered him to be killed.

Alexander would have to fight incessantly for another six years before he could make the entire Persian Empire his own. Alexander's victories are attributed in the ancient sources more or less exclusively to the catastrophic state of the Persian Empire and its weak, barbarian rulers. This brief overview, however, reveals that the Persian Empire from the time of Darius II to Darius III was not enveloped in constant decadence. Precisely under Artaxerxes II and III, the Achaemenid Empire attained power and influence that rivaled the empire of Darius I. Whether Alexander was a more capable general than Agesilaus at the beginning of the fourth century and simultaneously was the "catastrophe" that brought an end to the Achaemenid Empire has been the subject of many publications. The answer to this question depends on many factors, among which, however, fundamental structural weakness of the Persian Empire may be ruled out. The very fact that Alexander essentially imitated the Achaemenid administration of the enormous empire and found himself confronted by relatively independent satraps in Asia Minor after his lengthy campaigns in the east clearly demonstrate that these problems were not inherent in Persian rule. Maintaining control over so large a territory under ancient conditions was extremely precarious.

CHAPTER 33

The Conquest by Alexander

Krzysztof Nawotka

The principal facts of Alexander's conquest of the Achaemenid Empire can be ascertained with a high degree of probability. The limitations of the seemingly copious source basis, however, make understanding Alexander's motives sometimes difficult. A case in point is the perennial scholarly debate (Seibert 1998) on why Alexander decided to take on the much more powerful neighbor whose comparative military strength had been recently underscored by the setbacks suffered by Alexander's father Philip II on the eastern front: in 340 BCE in his attempts to take Perinthus and Byzantium, supplied with money, soldiers, and war materials by Persian satraps, and in 336–335 BCE in the defeat inflicted by the small mercenary corps on Persian pay led by Memnon of Rhodes on the Macedonian army dispatched by Philip II to Asia Minor. Philip's failure to sway the satrap of Caria, Pixodarus, to his side was another testimony to the cohesiveness of the Achaemenid Empire. The conspicuous silence of ancient sources as to Alexander's motives and objectives may to a degree reflect the lack of discussion among his circle of power as to whether to start war. To put it in Tarn's words: "The primary reason why Alexander invaded Persia was, no doubt, that he never thought of not doing it; it was his inheritance." (Tarn 1948: I, p. 8). War with Persia was certainly Philip's idea taken over by Alexander. The original war aims were probably limited to western Asia Minor, as reflected in the territorial concession Darius III was willing to make to Alexander after Issus when he offered to his opponent the land to the west of the river Halys (Müller 2016: pp. 268, 286).

Alexander's army marched from Macedonia in March 334 BCE to cross the Hellespont about a month later, retracing in the reverse order the route once taken by Xerxes in his invasion of Greece. The ancient authors give the strength of Alexander's army at between 30 000 infantry and 4000 cavalry and 43 000 infantry and 5100 cavalry, supported by 160 ships. The beginning of war was heavily laden with the symbolism of conquest, perennial conflict between Europe and Asia, and the Panhellenic revenge for Persian sacrilege of the years 480–479 BCE (Zahrnt 1996; Seibert 1998). Darius III did not lead his army personally, nor did he appoint a high-caliber general to command the Persian forces in Asia Minor, leaving to the local satraps conducting the war. The first clash on the river Granicus in May 334 BCE proved calamitous to the Persian cause in Asia Minor, depriving it of most of its fighting force and of its aristocratic leadership slaughtered by the Macedonian Companion cavalry. Alexander's first victory in this war was due to his military genius as much as to the weak and complacent Persian leadership, in the first place of Arsites, the satrap of Hellespontine Phrygia and the Persian commander-in-chief by virtue of conducting war in his satrapy (Badian 1977). Not only did he allow the invading army to cross the Hellespont unopposed but he also decided to fight the superior enemy forces against the advice of Memnon of Rhodes, the best general on the Persian side, on the Granicus sidelined to lead a small cavalry detachment raised from his land in Troad (McCoy 1989).

The battle of the Granicus gave Alexander a free hand to conduct operations in Asia Minor, while the treasury of Sardis, the Persian capital of Asia Minor, surrendered by its commander Mithrenes, saved him from immediate bankruptcy. Decisions taken in Daskyleion, immediately after the battle of Granicus, in Sardis, and soon after, marked the principal tenets of Alexander's policy in the Persian Empire: he left estates of Iranian aristocrats untouched, he retained the Persian taxation and administrative structure, of course with new appointments to the top positions, and he let Mithrenes enjoy a position at his court similar to that which his aristocratic pedigree would have earned him with Darius III (Briant 1993). Although the fully fledged Alexander's orientalizing policy was to come later, this was the beginning of the trend to claim the Persian Empire as his legitimate possession, won with spear but ruled in accordance with the Achaemenid tradition.

From Sardis, Alexander marched to Ionia, where a democratic revolution broke out in Ephesus. Alexander put an end to the ensuing chaotic purge of pro-Persian oligarchs, while embassies from Magnesia and Tralleis surrendering their cities provided him with an opportunity to overthrow oligarchies throughout Ionia, Aeolis, and Caria, and to proclaim the return of democracy. Even if Alexander's primary objective was strategic, to acquire new Greek allies in the war against Darius III, the constitutional transformation in western Asia Minor, as reflected in local inscriptions, was profound, giving an impetus to the triumph of democracy in the Hellenistic world (Nawotka 2003).

By that time the Persian resistance stiffened with the appointment of Memnon of Rhodes to the supreme command in the Aegean. He planned a counteroffensive in the sea coupled with wearing down Macedonian forces with sieges of select fortresses in Asia Minor. His designs were farfetched: to stir war in continental Greece, forcing Alexander to abandon Asia Minor, repeating the successful Persian strategy of 394 BCE when the victorious Spartan king Agesilaus was forced to interrupt his campaign in Asia Minor to fight the Corinthian War in Greece. Alexander devoted most of the late summer and fall 334 BCE to besieging Miletus and Halicarnassus. Unsupported by Memnon's navy taken over by Alexander's ship in the race to its harbor, Miletus could not withstand the Macedonian siege engines. It was stormed by Alexander's troops but spared destruction certainly for ideological reasons since plundering it during the Panhellenic war with Persia would have smacked too much of what the Persians had done at the end of the Ionian Revolt in 494 BCE (Bosworth 1988: pp. 250–254). The battle for Miletus showed, nevertheless, that Alexander's navy could do little beyond hindering the enemy from entering the harbor it was occupying, while its upkeep was taking more than one third of Alexander's total war expenditure at this time (Le Rider 2003: pp. 103–117). The expensive navy was disbanded and from this moment Alexander was set on the strategy of defeating Memnon's naval forces by denying it access to all ports, continental at least. This necessitated the winter of 334/3 BCE campaign along the Mediterranean coast of Caria, Lycia, and Pamphylia. Before that Alexander had to take Halicarnassus, the former capital of Mausolus and a powerful fortress occupied by Memnon's army and navy. After a relentless siege and a few battles with the garrison troops making sorties, in the late fall 334 BCE Halicarnassus was abandoned by its defenders, with the exception of two citadels providing shelter to the Persian forces in Caria. During the siege of Halicarnassus, Alexander was approached by Ada, the sister of Mausolus, in 341/0 BCE deprived of her rule in Caria by Pixodarus and from that time hanging on to the fortress of Alinda. The aging princess adopted Alexander, who in turn appointed her satrap of Caria. This was the first example of Alexander's flexible policy in the east of adopting local customs and buying local support by leaving civil administration in the hands of native kings, princes, and notables while military command usually stayed with Macedonian officers, Ptolemaios in the case of Caria (Bosworth 1980: pp. 143–154).

From Halicarnassus the Macedonian army split in two: with Alexander moving to the coastal Caria and Lycia, the most senior Macedonian general Parmenio marched through Sardis to Greater Phrygia to defeat its satrap Atizyes and to deny other Persian generals an opportunity to mobilize a new army from among Iranian military colonists in this area. The winter campaign of 334/3 BCE reportedly brought Alexander as many as 30 cities all the way to Phaselis in east Lycia. In spring 334 BCE he occupied Pamphylia and next

his army headed north. Its march through Pisidia was marked by heavy fighting in the sieges of Termessus and Sagalassus. Then, by mixture of force and negotiation, he took Celaenae, the capital city of satraps of Greater Phrygia, to meet Parmenio in Gordium. By spring of 333 BCE a large part of western, southern, and central Asia Minor was in Macedonian hands.

The battle for Halicarnassus and the spring campaigns of Alexander and Parmenio did not end the Persian resistance in Asia Minor. The satrap of Caria, Orontobates, fought with Ptolemaios for control of Caria for most of 333 BCE while Mithropastes and Hydarnes were raising new armies in the north and producing mass quantities of coins in Sinope to pay for the war effort. A concentrated Persian counterattack could cut Alexander's lines of communications with the Aegean coast and Macedonia. After Issus, Persian forces in northern Asia Minor were strengthened by the troops who managed to flee the battlefield and fresh recruits from Paphlagonia and Cappadocia posing an even greater danger to Macedonian rule in this land. Fighting Persian armies in central Asia Minor was the principal task of the newly appointed satrap of Greater Phrygia, Antigonus Monophthalmus, later the leading figure of the Age of the Successors. Through the interior lines strategy, by the end of 332 BCE Antigonus managed to defeat Persian armies, reversing the immediate danger, but for all his efforts parts of Asia Minor stayed out of Macedonian control for the rest of Alexander's life (Briant 2002: p. 831). The greatest challenge to Alexander, however, was in the Aegean Sea, where in early 333 BCE the vast armada of Memnon retook many islands, getting close to bringing war to continental Greece. There is no evidence, however, that Persian forces in Asia Minor and in the Aegean coordinated their operations to impact decisively the course of war. The death of Memnon during the siege of Mytilene in summer 333 BCE hampered the Persian offensive in the Aegean. Drying up of resources, especially of coined money, further reduced the Persian war effort in the sea, and it stalled when in the fall of 333 BCE Darius III recalled Greek mercenaries from the navy and ordered them to join his army. The final blow to the Persian navy came the following year when successful Macedonian operations in Phoenicia made Phoenician squadrons abandon the Persian cause. By the end of that year all of the eastern Mediterranean was under Alexander's control (Debord 1999: pp. 454–463). By the end of summer 333 BCE Alexander conquered Greater Cappadocia, leaving aside the Pontic part of this land whose ruler or satrap, Ariarathes, remained independent. Then Alexander's army crossed the Taurus mountains, taking lowland Cilicia with Tarsus. The mountainous part of it stayed largely independent and the Macedonian satrap, Balacrus, soon met his death trying to conquer it.

It looks as though Darius III decided to assume command of his army late in the summer of 333 BCE after earlier plans of opening a new front in Greece

faltered with the death of Memnon. The Great King contemplated another sensible plan advocated by an Athenian exile, Charidemus, to conduct war through a mercenary-based army with professional leadership. The plan fizzled away with the execution of Charidemus, who had fallen victim to cultural misunderstanding, having indulged too much in free speech at the royal court. At this point Darius had to lead. His army – with gross exaggeration estimated by the ancient authors at 300 000–600 000 soldiers, among which were 30 000 Greek mercenaries – gathered in Babylon and through the late summer–fall of 333 BCE moved slowly to Syria and then to Cilicia. By early November 333 BCE the armies of Darius and Alexander found themselves separated by the Taurus, both, it seems, unaware of the enemy's whereabouts. Darius, probably in the futile hope of catching by surprise and defeating two corps of the Macedonian army, made to the seacoast behind the enemy lines (Murison 1972). Alexander, now surrounded by Darius on land and by the Persian navy on sea, had to make a hasty return from Syria to fight a battle on the river Pinarus, now Payas (Hammond 1996: pp. 97–101), traditionally called the battle of Issus. The feared Macedonian phalanx stumbled in its charge against the Greek hoplites on Persian pay, but the superior Companion cavalry and Alexander's spirited leadership saved the day, breaking the enemy line in the place where the Great King stood. Darius fled the battlefield, not quite for fear but to spare his empire inevitable chaos if he had been killed in the battle (Nylander 1993, Müller 2016: p. 285). Much of the Persian forces left the battlefield in good order to fight other battles in Asia Minor, Egypt, Crete, Peloponnese, and Gaugamela. Nevertheless, Alexander's victory was complete: he defeated far superior enemy forces, took possession of enormous riches in the Persian baggage train here and in Damascus, and above all captured the most valuable hostages: the family of Darius III who had accompanied him to Issus.

Issus also provided Alexander with the unique freedom in choosing his strategy: either to pursue Darius to Babylon or to turn west in the direction of Syria and Egypt. He wisely chose the latter, delaying the final victory by a year or two but precluding any diversion behind his lines. Soon after the battle of Issus, Alexander's army moved to Phoenicia, an enormously important land of autonomous city-states fielding most ships for the Persian navy. Most Phoenician cities, beginning with the northernmost Aradus, surrendered without a fight. Some of the Phoenician rulers were removed – one, Abdashtart III of Sidon, was executed – but the local autonomous monarchy was retained, now of course reporting to the new satrap appointed by Alexander. By early February 332 BCE the Macedonians reached the strongest city in the region, Tyre. Prompted by religious rather than political considerations, it was the sole city to offer resistance (Amitay 2008), which led to the most epic siege in Alexander's history, lasting six months and involving some of the most daring engineering achievements of antiquity. Overwhelmed

by the naval might of all other Phoenician, Cypriot, and Greek navies now on Alexander's side, Tyre fell in August 332 BCE to a Macedonian assault followed by the slaughter reportedly of 8000–10 000 people and the enslavement of another 13 000.

Alexander's long stay in Phoenicia was marked with diplomatic activity, too. Through it he won the allegiance of autonomous statelets in Palestine, Judea, and Samaria, perhaps paying a short visit to Jerusalem (Nawotka 2010: pp. 195–6). Potentially of far greater consequence were Darius' entreaties to make peace with Alexander. Two embassies from the Great King showed up, the first in Marathus, immediately after the battle of Issus, and the second during the siege of Tyre. Conflicting reports of ancient authors make the reconstruction of peace negotiations hypothetical. What is sure is that Darius requested peace and the safe return of his family, offering increasingly more in exchange. It seems that he began from a mere ransom, reportedly of 10 000 talents, in the second stage agreeing to cede land in Asia Minor to the west of the river Halys. On top of that he made unprecedented offers of friendship, i.e. *de facto* recognition of the equal status of both monarchs. After some intense discussion with his advisors, Alexander rejected the peace offer, preferring to decide the outcome of the war on the battlefield (Briant 2002: pp. 832–840).

From Tyre the Macedonian army marched in the direction of Egypt, with one notable stopover at Gaza taken by storm after a two-month long siege. Egypt, on the contrary, offered practically no opposition and with that capitulation all of the eastern Mediterranean was in Alexander's hands. In Egypt Alexander successfully played pharaoh, having sacrificed to Apis and other gods, commissioning construction work in temples and assuming all royal titles and the double crown (Wojciechowska and Nawotka 2014). He preserved the basic administrative structure inherited from the times of the Saite dynasty, making sure, however, that the real power, administrative and military alike, was split among a number of Macedonians, Greeks, and natives, the most prominent of whom was the chief of finance, Cleomenes of Naucratis (Le Rider 2003: pp. 238–262).

In late spring 331 BCE Alexander's army set off from Egypt to reach the Tigris in the second half of September. Since Alexander rejected Darius' third peace offer, the fate of the Persian Empire had to be decided in battle. The Persian army was numerically superior, although far smaller than 1 400 000, Arrian would like us to believe, and this time it was Darius who chose the battlefield of Gaugamela, broad enough for his forces to deploy freely. The battle was fought on October 1st 331 BCE. Again, despite some initial success for the Persians, a relentless charge of the Companion cavalry led by Alexander broke through the enemy line, forcing Darius to flee and all of his army followed suit. Alexander's decisive victory was followed by his proclamation as king of Asia, i.e. the ruler of the Persian Empire (Nawotka 2012). Again he did not pursue Darius, preferring the methodical conquest of the heartland of

his empire. On 21 October that year, after intense negotiations, Alexander entered Babylon and was greeted by its population as their legitimate king (Kuhrt 1990). Mazaeus, a noble Persian, who distinguished himself at Gaugamela, was appointed satrap of Babirus and this started a new trend: from this point most people elevated to satrapal posts by the new king of Asia were noble Iranians. Next to surrender and to be reappointed was the satrap of Susa Abulites. Having broken the last line of Persian resistance in the Persian Gates, in January 330 BCE Alexander occupied Persepolis. With Susa and Persepolis Alexander got hold of the fabulous riches of the Persian Empire, estimated by ancient authors at 170 000 talents. The winter sojourn in Parsa was filled with attempts first to win over inhabitants of this Achaemenid heartland and when this failed, to break their opposition with terror, culminating in the burning of the palaces in Persepolis in May 330 BCE (Bloedow and Loube 1997; Shahbazi 2003).

Unable to gather another army, Darius fled his temporal capital of Ecbatana in the direction of eastern Iran. He never reached it, being arrested by his senior advisors in a desperate move to avert the wrath of gods by instituting a substitute king. Darius was killed by them when the Macedonian pursuit was dangerously close. This prevented Alexander from capturing Darius to make him abdicate in his favor, thus strengthening Alexander's credentials as king of Persia (Nylander 1993). Hence in July 330 BCE there were still two kings of Asia: Alexander and Artaxerxes V or Bessus the satrap of Bactria and Sogdiana. The death of Darius marked the end of the Panhellenic war, Greek allied soldiers were honorably discharged, but most of them continued to serve as Alexander's mercenaries. Before dealing with Bessus, Alexander turned west to consolidate his control of Media and Hyrcania. There, in Zadracarta, he established his Persian royal court to which flocked Iranian aristocrats, clearly giving preference to Alexander over Bessus/Artaxerxes V. The most prominent of them was Oxyathres, Darius' younger brother, made a king's companion (Spawforth 2007).

The next objective was Bactria of Bessus. But earlier, in fall 330 BCE, alerted by the revolt of Satibarzanes, the satrap of Areia, Alexander had to turn back to retake Areia and to put Drangiana and Arachosia under his control. The neighboring Gedrosia surrendered without fight in winter 330/329 BCE. Troubles in Areia lasted until winter 328/7 BCE, however. In late winter 329 BCE Alexander's army marched through Kandahar to Kabul Valley to cross the Hindu Kush, possibly by the Sawak Pass, by May 329 BCE. Bessus, unable to offer effective resistance, was soon handed over by his allies to Alexander, who in turn released him to Oxyathres. He, in front of Persian and Median notables gathered in Ecbatana, presided over the execution of the regicide. Despite this initial success, the conquest of Bactria and Sogdiana was a challenge. Attempting to base his rule on garrisons and newly established Greek cities, Alexander disturbed the traditional social structures and balance of power in central Asia,

leading to two years of fierce fighting. His most formidable enemy was Spitamenes, long enjoying the support of the Scythians from across the Jaxartes. Neither his death in 328 BCE nor the campaign of terror could produce the desired result of bringing Bactria and Sogdiana into Alexander's fold. All changed in spring 327 BCE with new tactics of showing mercy to the defeated Bactrian and Sogdian lords, who were now offered the chance to continue to rule their subjects in return for paying respect to the new king of Asia. One of them was Oxyartes, whose daughter, Rhoxane, married Alexander in spring 327 BCE. The combination of leniency, Greek colonies mostly settled with veterans, and strong garrisons planted throughout Bactria and Sogdiana pacified this land in 327 BCE, effectively bringing all of the Achaemenid-Persian Empire under Alexander's control (Holt 1988). His expedition to India, although partially motivated by the tradition of Persian rule in the Indus Valley under Darius I, in 327–325 BCE, was clearly going beyond the reach of the Achaemenid Empire, in search of the end of the inhabited Earth.

During his conquests Alexander played many roles: the liberator of the Greeks of Asia, pharaoh of Egypt, king of Babylon, and above all the Persian king. With first hints at it in his letter to Darius, he proclaimed himself king of Asia at Gaugamela to defend his status in the relentless pursuit of Darius III and the rival king Bessus/Artaxerxes V. Iranian aristocrats received positions at Alexander's court from spring 334 BCE while four years later most trappings of a Great King, including Persian court, guards, and royal attire, were adopted. An attempt to move a step further was taken in 327 BCE when Alexander tried and failed to unify his court in the eastern ceremonial of proskynesis. Then came the wedding at Susa in 324 BCE when, with Alexander's encouragement, about 90 of his Greek and Macedonian companions married Iranian princesses. Certainly it was Alexander's design to crown the conquest by unifying the elite of the leading peoples of his empire, which after his death was to be ruled by his half-Iranian son.

SECTION IV.C

UNDER PERSIAN RULE

CHAPTER 34

Pārsa and Ūja

Ali Mousavi and Touraj Daryaei

The Center of the Empire

In the *dahyāva* lists of the Achaemenid royal inscriptions, the entries Pārsa and Ūja represent the heartland of the Persian Empire. Geographically the names of these two provinces describe the historic territory that, transcending the Zagros mountains, included Khuzestān, the lowlands on the eastern flank of Mesopotamia, as well as the region of modern Fārs on the Iranian plateau. In a broader sense the center of the empire also included Media and Babylonia, the *dahyāva* Māda and Bābiruš, in whose capitals Ecbatana and Babylon building activities of the Achaemenids are attested. As far as archeological examination allows for conclusions, however, the extent of construction work there is not comparable to the ambitious embodiment that made various places of Pārsa and Susa in Ūja representative centers of the empire (cf. Chapter 70 The Residences). Especially under Darius who started building activities at Susa and Persepolis at about the same time (for an early dating of planning and building also at Persepolis see Jacobs 1997, esp. pp. 298–299), the old highland–lowland duality of pre-Achaemenid epochs, most clearly expressed by the Middle-Elamite title “King of Anšan and Susa,” experienced a rebirth (Henkelman 2017: p. 113).

Source Problems

When dealing with the history of Pārsa and Ūja during Achaemenid times we face a characteristic source problem: From the various archives, above all the Persepolis Fortification Archive, we are quite well informed about lasting conditions, i.e. the regional administration (see recently Henkelman 2017; cf. Chapter 62 Persia) and religious practices (cf. Chapter 85 The Heartland Pantheon; Chapter 86 Practice of Worship in the Achaemenid Heartland). Archeological findings and secondary sources give us an idea of Achaemenid architecture and figurative and ornamental endowment of buildings (cf. Chapter 70 The Residences and Chapter 94 Statuary and Relief), of life at the Achaemenid court (cf. Chapter 71 The Court), and of banquets, feasting, and gift exchange (cf. Chapter 73 Banquet and Gift Exchange). About specific events, however, we are informed only in a few instances, this due to the well-known gradual decline of information from west to east as far as Greek and Roman narrative sources are concerned.

Specific Events

Persian rule in the present context begins with Cyrus taking a leading role among local rulers and chieftains in the region and assuming the title King of Anšan to underline his claim to leadership. His successes, beginning with the victory against the Median king Astyages/Ištumegu, found a representative expression in the foundation of Pasargadae, a place about 80 km north of the old city of Anšan, as new capital of the kingdom around the middle of the sixth century BCE. At Anšan, a dignified center of old, no significant remains which could be termed Achaemenid have been found so far. The construction of a new capital is significant in that it bespeaks the new king's desire to depart from the traditional dynastic locality. Classical sources inform us that the reason for erecting Pasargadae at its special place may have been the fact that Astyages' defeat by Cyrus probably took place nearby (Strabo 15.3.8; on Pasargadae as capital of the first world empire, see Humbach 2003: p. 112).

Pārsa and Ūja were heavily affected by the unrest of the years 522–520/19 BCE (cf. Chapter 30 Imperial Crisis), which the empire experienced after the death of Cambyses. The crisis was caused by the rebellion of a certain Gaumāta, a magus who proclaimed himself king pretending that he was Bardiya, the second son of Cyrus. The unrest continued for a few months until in September 522 BCE Darius, a member of another Persian family, slew Gaumāta and ascended to the throne (DB §§ 10–15). According to the Bisotun inscriptions, a certain Vahyazdāta, who also called himself Bardiya, rose against Darius from a location named *Paīsiyāhuvādā* in Fārs (Dandamaev 1989:

p. 95). Initially, Vahyazdāta was successful in his effort because, as we are informed by the Bisotun inscription, many in Fārs sided with him. He claimed to be king (DB § 40), and was able to stretch his power all the way to the east to Arachosia (Dandamaev 1989: p. 116). Darius responded by sending an army to fight the new king, first in Arachosia and then in Fārs. There were several battles, first in Rakha, where Darius' commander, Artavardiya, was not able to completely defeat Vahyazdāta. During the second battle near Mt. Parga in Fārs, Darius' *bandaka* was victorious and the rebel leader and many of his forces were either killed or arrested. Vahyazdāta along with 52 of his followers were killed in Fārs at a location called Uvādaicaya, probably Elamite Matezziš (DB §§ 41–44; Dandamaev 1989: pp. 116–117).

Darius also faced several revolts in Ūja, the last one headed by a man named Aθamaita (DB § 71). This Aθamaita has tentatively been identified by some with Atta-hamiti-inšušinak (Tavernier 2004: pp. 3, 5–6, 22–29; Potts 2010: p. 133), who is known from a stele whose fragments were found at Susa (Potts 1999: p. 298 Pl. 8.1; Potts 2010: pp. 134–135 Pl. 1–2). If this identification is correct, we may think of him as a vassal ruler, probably installed by Cyrus or Cambyses, who, after his defeat, was replaced by an official. This official may already have been Bakabana, well known from the Persepolis Fortification Archive and, with all probability, satrap of Ūja. If the identification is to be rejected, Bakabana should have had one or more predecessors in his position as satrap and Aθamaita should be regarded as a short-lived rebel.

One of the few specific events in the heart of the empire of which we learn from the sources was the struggle between Xerxes and his half-brother, Artobarzanes, for the succession of Darius. That Herodotus' report, which is the most detailed on this contention (Hdt. 7.2–3), has a historic background is confirmed by the fact that Xerxes apparently alludes to it in one of his inscriptions (XPf §3; Jacobs 2014: pp. 347–348) and that both claimants figure in the Persepolis Fortification Archive (i.a. PF-NN 1657; PF 2052).

Another specific event that puts the province of Fārs at the center of attention is the conquest of Alexander and the destruction of Persepolis. After the defeat of Darius III at Gaugamela, the Persian general Ariobarzanes retreated into the Zagros to protect the province of Fārs and its ceremonial centers. Ariobarzanes chose a gorge which came to be known as the Persian Gates. The figures for the number of Persian soldiers vary, depending on the reporter. According to Arrian's account there were some 40 000 infantry and about 700 horsemen (Arr. Anab. 3.18.2). After an initial setback Alexander was able to circumvent the Persian forces and surprise Ariobarzanes. The battle is described as fierce fighting and many Persians fell in combat or from the gorge: "Unarmed men grappled with men who were armed, dragging them to the ground by virtue of their bodily weight and stabbing many with their own weapons" (Curtius 5.4.32). It appears that Ariobarzanes along with 40

cavalrymen and 5000 infantry was able to break through Alexander's forces and get to Persepolis. However, Tiridates, who was in charge of Persepolis, did not let him enter and so Ariobarzanes and his forces put up a battle to the end (Curtius 5.4.33–4).

Alexander and his forces then entered Persepolis, sacked the city and killed its inhabitants, but ordered that the citadel, the palatial buildings on the stone Terrace, was not to be destroyed. The conqueror then took tons of gold and silver from the treasury (120 000 talents), staging games and sacrificial ceremonies in celebration of his victory. The wealth of the Persian Empire was also housed at Persepolis, only to be followed by Pasargadae (6000 talents) (Curt. 5.6.9–10). After four months of stay, Alexander decided to burn the palaces at Persepolis. Reports vary as to the reason for the burning of the city, whether it was done purposefully or was an accident (for a full discussion, see Mousavi 2012: Chapter II). Whatever the truth may be, it is clear that the symbolic heart of the Persian Empire stopped beating, and with this event, resistance on an imperial scale to the Greco-Macedonian conquerors was futile. While Cyrus the Great's victory at Pasargadae marked the advent of the Persian Empire, Alexander's destruction of Persepolis brought an end to the symbolic importance of Fārs, at least for 500 years.

What is otherwise reported by classical authors about the Persian heartland between the times of Darius I and Darius III is for the most part located at the court and is often more storytelling than historiography. Bichler (2010) has pointed to the fact that figures we encounter in Herodotus' *Historiae* give the impression of acting on a stage rather than at the Achaemenid court. This is especially true for information quoted as coming from Ctesias. In the picture drafted by Ctesias, intrigues and murder are commonplace, and traits of despotism and distorted gender roles are among the most formative characteristics (cf. Rollinger 2010).

The Designing of the Imperial Center

The sources – primary and secondary written sources as well as archeological findings – that inform us as to how Pārsa and Ūja developed as the center of a world empire are more complex and reliable. Cyrus' victories in Asia Minor, Mesopotamia, and the east, and Cambyses' conquest of Egypt, introduced an exceptional craftsmanship to Persia. The buildings at Pasargadae and Borazjan (in southern Fārs), at Susa, and at Persepolis bear the marks of architects, artists, and craftsmen from Ionia, Lydia, Babylonia, Assyria, Elam, the Levant, Egypt, and others. Nylander's studies on the stoneworking techniques and architectural features have demonstrated, for Pasargadae, considerable western influence in the construction of the royal buildings (Nylander 1970).

Boardman's research on archeological evidence for western influence in Persia has broadened the spectrum of participating nations (Boardman 2000). Primary sources from Babylonia attesting the employment of Babylonian workers at the royal site of Matannan in Persia supplement the picture (Henkelman and Kleber 2007; Tolini 2011: pp. 94–95; Zadok 2011a: p. 130; 2011b). Taken together the evidence parallels to a certain degree Darius' inscriptions *f* and *z* from Susa, where he numbers the nations that took part in the erection of his palace there (DSf §§7–13; DSz §§7–12). The external influence is never predominant, however, and the finished buildings can “only and rightly be termed Iranian, Achaemenid art” (Nylander 1970: p. 148).

Pārsa was the ancestral homeland of the royal house. Here the sources localize the beginning of each king's rule and here the royal tombs were erected. So Pasargadae is to be named if Plutarch is right when stating that it was the location of a ceremony to be performed by the new king to be accepted as legitimate ruler and, ultimately, successor of Cyrus. According to Plutarch, the chosen one had to make a trip to Pasargadae where he received royal initiation at the hands of the Magi (Plut. Artax. 3.1–2):

A little while after the death of Darius (II), the new king made an expedition to Pasargadae, that he might receive the royal initiation at the hands of the Persian priests. Here there is a sanctuary of a warlike goddess whom one might conjecture to be Athena. Into this sanctuary the candidate for initiation must pass, and after laying aside his own proper robe, must put on that which Cyrus the Elder used to wear before he became king; then he must eat of a cake of figs, chew some turpentine-wood, and drink a cup of sour milk. (Transl. B. Perrin)

Admittedly, the reliability of this report was contested and the initiation ceremony rejected as an historical reality (Binder 2010); the question as to whether Plutarch's report is authentic is so far unanswered. We stay on safer ground regarding the localization of the tomb of Cyrus the Great at Pasargadae (Arr. Anab. 6.29.4–6). Stronach convincingly summarized the arguments for the identification of the famous gabled hut at Pasargadae as Cyrus' last resting place (Stronach 1978: pp. 24–26). After the king's death, his body must have been taken back there for the funeral. This becomes clear from Arrian, who tells us that when Alexander of Macedon was coming back from India and stopped at Pasargadae, he saw that Cyrus' tomb had been ravaged and that the body of the king had been thrown out of the sarcophagus (Arr. Anab. 6.29.9). In the same context Arrian provides us with the description of a religious ceremony which had taken place at the tomb during the whole Achaemenid period. Nearby there was a small building for the Magi who guarded the burial house. For the priests, a sheep a day and rations of flour and wine were allocated, and for the performance of a sacrificial act at the

tomb a horse was given each month by the ruling king in order to be sacrificed to Cyrus (Arr. Anab. 6.29.7).

Also the successional kings were buried in Pārsa: Cambyses, the son of Cyrus, was laid to rest at Nīrīz in southeastern Fārs (Henkelman 2003: pp. 144–145). Another member of the royal house, possibly Hystaspes, may have been entombed in the Takht-e Rostam on the Marvdašt plain (Hystaspes as tomb owner was proposed by Henkelman 2003: p. 158; cf. the older approaches to date this monument in Kleiss 1971 and Stronach 1978: pp. 302–304; an overview of datings and attempts to name the deceased buried here is given by Bessac and Boucharlat 2010). The Achaemenid kings from Darius I onward found their last resting places in the dynastic funerary ensembles at Naqš-e Rostam and Persepolis (on the problems of religious and cultural continuity from Cyrus to Darius I, see Jacobs 2010).

As at the tomb of Cyrus, at the other places sacrifices for the dead kings seem to have been offered. In the Persepolis Fortification Archive, allocations for the *šumar* of Cambyses are documented (Henkelman 2003), and architectural remains in front of the rock-cut tombs at Persepolis may be remnants of installations for the performance of ritual acts for the rulers who were entombed there. Whether the Ka'abe-ye Zardošt at Naqš-e Rostam had a function in a similar context is uncertain (Schmidt 1970: pp. 44–49; Frye 1974: p. 386; Sancisi-Weerdenburg 1983). The royal graves were an important element that made Pārsa the undisputed ceremonial and commemorative heartland of the Persian Empire.

From the time of Darius I, Persepolis and Susa were the most important centers of the empire. They were both preferential destinations for travelers from the whole empire (Briant 2010: pp. 34–37 tabl. 1; Henkelman 2017: pp. 114–115) and linked by an important road connection (on its course and way stations, see Koch 1986; Arfa'i 1999; Potts 2008). According to Neo-Babylonian and Elamite sources, both cities and their surroundings attracted foreign workforces. The Babylonian documents repeatedly report the deployment of Babylonian and other workers to Elam and Persis. At both destinations also businessmen from Babylonia were present (Waerzeggers 2010; Zadok 2011a: pp. 128–136, 2011b).

Termed “capitals” in the Classical sources, Persepolis and Susa are, to a certain extent, similar and dissimilar. One may think, on the one hand, of the freestanding gates and the great hypostyle reception halls here and there, and on the other hand, point to the palace building at Susa, which does not find any parallel at Persepolis (see Chapter 70 The Residences). So, albeit both places were seats of a regional administration (for a “Susa Fortification Archive” cf. Henkelman 2017: pp. 115–126), their general function is debated. Regarding Persepolis, Mousavi pointed to its role as a location for ceremonies and ritual (Mousavi 2012: p. 10), and argued that its designation

as a palace complex along with the city of Persepolis does not do justice to all its functions. It was Lentz who proposed the tantalizing thesis that Persepolis had a cosmic function, with a specific design plan for astronomical observation (Lentz 1972: p. 289). More recently, the possible religious function of Persepolis has also been suggested. The idea is that the *tacara* of Darius and the *hadiš* of Xerxes provide important iconography, where some of the bearers of objects and animals could be priests. Thus, these figures may be participating in a ritual sacrifice and sacred ceremonies (Curtis and Razmjou 2005: p. 54). Razmjou believes that Persepolis was a center for religious ceremonies, thus the place was not solely residential (Razmjou 2010: p. 244). A similar view was taken by Root, who recommends broadening our understanding of what should be termed a temple and assigns religious functions to some palaces at Persepolis (Root 2010: esp. pp. 172–176, 207–208).

Susa, meanwhile, in recent years has repeatedly been characterized as the virtual capital of the empire. Its outstanding importance becomes apparent, i.a. from the fact that Babylonian representatives from the late sixth century BCE onward used to travel to Susa to manage Babylonia's tax obligations. In this context labor and commodities were transferred from there to the empire's center (Waerzeggers 2010; Tolini 2011: esp. pp. 307–334). The logistic problems that arose in this context, especially the problem of transportation, were overcome to ensure adequate supply of foodstuffs during comparably long sojourns of the court at Susa which could not be warranted by the city and its hinterland alone (Henkelman 2017: pp. 113–114, 123–129).

Special ceremonies (Elamite *šip*) that were held in Fārs, and in which either the king himself or the king's representative took part, again put a lot of emphasis on this province. The locations which were venues for these festivities included, according to the Persepolis Fortification tablets, Appištāpdan, Batrakataš (Pasargadae), Išgi, and Pumu, all in or close to the Fārs province (Henkelman 2011: pp. 98–99). Xerxes performed such a ceremony personally (XPh_c 30, 32–34, 41, 44), while at other times Parnakka or Ziššawiš could act as representatives of his predecessor (Henkelman 2011: p. 119). These festivals illustrate the special status of the imperial center that arose from the historic development and the provenience of the ruling dynasty.

CHAPTER 35

Media

Bruno Jacobs

In the fifties of the sixth century BCE the Median king Astyages lost the historical struggle with Cyrus, king of Anšan (on Anšan and its dynasty see Chapter 28 Elamite Traditions), and Media fell to the latter. The size and political structure of this political entity are debated (see Chapter 25 The Median Dilemma), but it must have given shape to the Achaemenid province of Media and it must have become an essential basis for Cyrus' immense extension of power in the years to come (Waters 2010; cf. the thoughtful argumentation of Rossi 2010: pp. 310–316).

Remarks on Media's Position in the Achaemenid Empire and on Median Ethnicity

Among the provinces of the Achaemenid Empire the land (*dahyu-*) Māda / Media seems to have played a privileged role. In lists of those countries, as given in Achaemenid inscriptions, and in pictorial representations of them Māda is – with the exception of the Bisotun list (§ 6) – always understood as forming the center of the empire together with Pārsa and Ūja (Vogelsang 1986: pp. 131–133; cf. Briant 1996: pp. 185–194) and wordings like “Persia,

Media and the other countries” (DB §§ 10–12; DPg §§ 1–2) distinguish Media from all other provinces of the empire. Formulations in classical sources which likewise contrast Persians and Medes with all other inhabitants of the empire sound like an echo of that phrase (Hdt. 8.89). Persons of Median origin were, besides Persians, the only ones who had access to highest ranks at court (Briant 1996: p. 93). This prestigious position of Medes in the imperial hierarchy may have been one of the factors that led to “Medes” and “Persians” being treated as broadly synonymous in western sources (generally on that topic Tuplin 1994: pp. 235–237). Another hint of their special status may be the fact that from about the fifth month of the first year of Xerxes onwards in Babylonian documents the title “King of Persia and Media” is used with various modifications (Tuplin 1994: p. 256; Rollinger 1998: pp. 355–356 and 371).

All of this seems to be in marked contrast with Herodotus and Xenophon who suggest a deep rooted ethnic opposition between Persians and Medes. Xenophon’s *Cyropaedia* presents a confrontation between the Medes, who enjoy great power but have succumbed to a life of luxury, and the Persians, a people of modest origins but great ambition (Tuplin 2003: p. 354). Herodotus turns the rebellion of the magus¹ Gaumāta into a Median counterrevolution against the above-mentioned shift of power from the Mede Astyages to Cyrus. A literary key-element of this conception is the demand put forward by Cambyses on his deathbed, to wrest power from the usurper and not to let it fall back again to the Medes (Hdt. 3.65). If there was really such deep-rooted antagonism between Mede and Persian in the time of Cyrus and Cambyses, the privileged position enjoyed by the Medes only a short time later would have to be the result of an implausibly swift change of conditions after the end of the imperial crisis. In fact, the circumstances surrounding Darius’ struggle for power make it apparent that an ethnic opposition of this sort did not exist.

A remark made by Darius in the Bisotun inscription (DB §13) gives an important hint in this direction. Justifying his commitment to the struggle for the throne, he complains: “There was no man, neither a Persian nor a Mede nor anyone of our family, who might have been able to despoil that Gaumāta the *maguš* of the kingship.” Apparently it seemed obvious to him that not only a Persian but also a Mede might have taken the initiative to protect the interests of the legitimate claimants to the crown, i.e. the Achaemenids (Jacobs 2011: p. 648).

During the subsequent battles against the “Lying kings” the dividing line between Darius and his enemies cut across the distinction between “Medes” and “Persians.” Even while the Median revolt described in the Bisotun inscription was still going on – the battles in Armenia, for instance, had still not been fought – Darius despatched troops against the Persian Vahyazdāta. As reported in the Babylonian version (DBbab §33), this man apparently had caused soldiers from Anšan to change sides and rebel against Darius. A small section of this

force which had remained loyal and a Median contingent were now sent by Darius against his Persian opponent. With the remaining Persian troops Darius himself marched against Media (DBab §34; cf. DB §41; see also the translation in Lecoq 1997: pp. 202–203). Although “Median” and “Persian” in this context are rather to be understood as administrative than as ethnic terms, the situation nevertheless makes it obvious that ethnic affiliation did not define which master was obeyed in these cases. The same already applied to the struggle of Cyrus against Astyages: “(Astyages) mustered (his army) and marched against Cyrus, king of Anshan, for conquest ... The army rebelled against Astyages and he was taken prisoner. Th[ey handed him over] to Cyrus ...” (Grayson 1975: p. 106). This description stems from the so-called Nabonidus Chronicle, a text from Achaemenid times, which may be idealizing the decisive event from a Persian point of view. But, if the statement is basically true, it seems that serving a Persian master was no problem for Median soldiers in those days, or in other words: there was no opposition based on ethnic difference.

Such an opposition can also not be upheld on the basis of an ethno-linguistical definition that has Persians speaking “Persian” and Medes speaking “Median”: this was recently convincingly demonstrated by A. Rossi (Rossi 2010; cf. Windfuhr 2006: p. 384), the evidence being the Achaemenid inscriptions themselves with their “interdialectal koiné” (Rossi 2010: pp. 320–321; cf. already Lecoq 1974).

Administering Media

Cyrus is said by Xenophon to have appointed his son Tanaoxares as satrap of Media, Armenia and the territory of the Cadusians (Xen. Cyr. 8.7.11). In the problematic final section of the *Anabasis*, a satrap of Media named Arbaces is mentioned (Xen. Anab. 7.8.25). For the year 409 BCE the same author reports on an insurgence in that province (Xen. Hell. 1.2.19). Some additional information about Media as a satrapy of the Achaemenid Empire can be gained from sources which refer to the time of Alexander the Great. So a certain Bisthanes, son of Artaxerxes III, seems to have been satrap of the province when Alexander appeared on the scene (Arr. Anab. 3.19.4). But Strabo’s (11.13.1 [C 522/23]) confrontation of a *Greater Media* with a Media named *Atropatios* reflects a younger terminology, which sets the realm of Atropatene², which won independence under the leadership of the (sub-)satrap Atropates, in opposition to the Media which was conquered by Alexander and was later part of the Seleucid Empire (cf. Trogus in Just. Epit. 13.4.13). Both parts together, possibly also including Paraetacene (Xen. Anab. 2.4.27; 3.5.15; cf. Jacobs 1994: pp. 179–182; Tuplin 2003: pp. 358–360), should correspond approximately to *Māda* as listed in the catalogues of countries in the Achaemenid inscriptions.

A more extensive entity called *Media* seems to emerge in the Bisotun inscription in the context of the insurgence of Fravartiš. Rebellions necessarily rise within given administrative conditions. These present the political framework within which the leaders of uprisings can establish themselves. Within the core province Media the suppression of Fravartiš was effected in two steps. The description in §§ 25 and 31–32 of the Bisotun text is closely entwined with reports about fighting against rebels in Armenia (DB §§ 26–30) – an initiator is not mentioned here – and Asagarta (DB § 33), where a certain Ciçantaxma is named as chief. This man, like Fravartiš, claimed to be related to the Median king Uvaxštra / Cyaxares. All of these military activities are, after being successfully brought to an end, summed up with the words: “This (is) what has been done by me in Media” (DB § 34). The comprehensive version of Media that is plainly visible here also included Parthia (and Hyrcania) (Jacobs 1994: pp. 176–177; Rollinger 2005: pp. 21–22; cf. Waters 2010: pp. 67–68).

Media as Part of the Imperial Economy and Inter-Provincial Communication

Beyond the abovementioned instances Media is, in Achaemenid times, only incidentally highlighted by the sources. From the Babylonian archive of the so-called Egibi family we get the information that already in 537 BCE, i.e. immediately after the incorporation of Babylonia into the Achaemenid Empire, a representative of that business house was active in Ecbatana – which is, by the way, the first indisputable reference to the name of the city (Strassmaier 1890: *Cyr.* 60; but cf. Medvedskaya 2002). Subsequently several documents testify to the activity of members of the Egibi family in Ecbatana and at other places which are possibly to be located in Media (Zadok 1976: pp. 71–73; Dandamayev 1986).

In Aristophanes’ *Wasps* (ll. 1131–47) we hear about a robe in Athenian ownership, called *kaunakes*; this was reportedly made at Ecbatana and may provide a hint that textile-production was of economic importance.³ Beyond that we can only surmise that in Achaemenid, as in Assyrian times (Radner 2003: pp. 42–43 and 61; Gopnik 2011: pp. 287–290, 301–302), horse-breeding was an important economic factor and that the animals were part of the tax payments imposed upon the province (see Chapter 16 Media). The participation of Medes in working the gold and in decorating the castle wall, as documented in the so-called Foundation Charter of Susa (DSf §13), may also have been services generated by tax obligations.

So far Media is named 24 times on tablets of the Persepolis Fortification Archive, normally as the starting point or destination of travelers. Two other documents (PF 0732 and NN 2502) provide information about commodities

which were brought to Ecbatana to be consumed there “before Irtašduna,” the wife of Darius I. In this context W. Henkelman has drawn attention to the availability of corresponding information about Susa, a parallel which suggests that Ecbatana functioned as an administrative center in much the same way as Susa is known to have done (Henkelman 2010: p. 714 n. 174 and personal communications). In a similar way a Babylonian document from the Michigan Collection which mentions an administrative order issued by a *bēl tēmi* holding office in Media seems to illustrate the fact that Media was well embedded into the inter-provincial communications of the empire (Stolper 1989: p. 302).

NOTES

- 1 A magus (Old-Persian *maguš*) seems to be a member of a class of priests (cf. de Jong 1997).
- 2 Possibly Atropatene did not get its name from that satrap, but inversely the satrap got the title Atropates pursuant to the name of the province (Nagel 1982: p. 35 n.10).
- 3 But as Miller (1997: pp. 154–155) points out, “Ecbatana” may stand here for “Persia” in general.

ACKNOWLEDGMENT

The author is very grateful to Christopher Tuplin for his assistance with the English version of this chapter.

CHAPTER 36

Babylon

Robert Rollinger

Babylonia and Babylon are at the crossroads of multiple traditions that focus on and imagine the history of the Ancient Near East in the first millennium BCE. In a more general and substantial way, these traditions considerably influenced western thoughts, past and present, on the Near East, its culture, and cities, as well as “oriental” imperial power and politics. Before modern archeologists started to excavate the residences of the Ancient Near Eastern empires in the nineteenth and twentieth centuries, and before philologists began to decipher and read cuneiform tablets, it was classical sources and biblical texts that shaped the imagination of Ancient Near Eastern empires, their rulers, their cities, and their culture. In this context, Babylon loomed large, attracting an increasingly multilayered set of imagined conceptions and accruing thoughts that developed a life of their own. Herodotus’ *Histories*, Ctesias’ *Persica*, the Alexander historians, the church fathers, universal histories, and Christian chronicles were powerful and influential cornerstones of this tradition that was retold and reshaped again and again in antiquity and transmitted through the Middle Ages to later centuries (Rollinger 2008).

The stories told and the images called up by this tradition shared some common strands that became markers of how Ancient Near Eastern history had to be perceived. Babylon and the Near East were “old”; it was the region where the first empires flourished and where for the first time mighty kings established their rule. This framework was filled with a combination of often conflicting notions. On the one hand, there was admiration for overwhelming imperial power and the manifold testimonies of human achievement as they

A Companion to the Achaemenid Persian Empire, Volume I, First Edition.

became evident in the gigantic building programs and the enormous size of the cities. On the other hand, however, admiration was tempered by contempt and disdain. Oriental rule was associated with tyranny, the kings described as ruthless despots, and their achievements interpreted as examples of unlimited megalomania. Moreover, these empires were transient, they succumbed to the vicissitudes of time. Their cities lay in ruins and their rulers were thrown from their thrones.

This last point was probably the most powerful image and message tradition conveyed. By means of the theme of *translatio imperii* (the transfer of empires), also inaugurated by Greek historiography (Wiesehöfer 2003), an idea was established that conceptualized world history as a never-ending chain of successive empires that began in the Middle East and continued through present times. Since this conception was adopted further by the masters of Christian universal history, it experienced an astonishing longevity, until it became obsolete in the eighteenth and nineteenth centuries when the prerogative of interpreting history passed from theologians to professional historians.

All this had considerable consequences. It is true that classical tradition and its successors used to characterize the kings of Babylon, Assyria, and Persia as the “other,” especially as opposed to a blissfully romanticized West, but, so far, this “other” was still part of one’s own tradition. Ancient Near Eastern kings were regarded as despots, indeed, but they were vivid examples of the danger that western kings and emperors could succumb to the same negative behaviors. With the establishment of history as an academic discipline, this kind of conscious connectivity came to an end. It was replaced by another attitude that claimed to have overcome this outdated tradition, although it vigorously focused on world history through an even more romanticized western lens. Classical and biblical sources were regarded as representing myths, amusing tales, and entertaining stories, but not “historical truth.” The latter had to be explored and reconstructed by using entirely new sources, i.e. archeological excavations and the ever-growing mass of cuneiform texts unearthed in the Middle East.

However, the self-confident idea of having overcome the rich set of conceptions and ideas transmitted so successfully and eagerly through the centuries was a fallacy. What changed was an overt and direct reference to this tradition, but it vigorously survived as an unconscious yet still vivid point of reference and interpretation. This becomes evident with the German excavations in Babylon and the scientific interpretations published in the succeeding decades concerning Babylon and Ancient Near Eastern history. As we will see, the established narrative of Persia and the Persian kings plays a crucial role in this context.

The most extensive and influential description of the city of Babylon originates from Herodotus’ *Histories* (published in the last third of the fifth

century BCE). In the first book, the historian gives a detailed overview of the city, which he characterizes as a true megalopolis (*Histories* 1.178–187). According to Herodotus, Babylon represents a square of four times 120 stades, i.e. a circumference of 88–96 km. The city walls are 50 royal cubits (about 27 m) wide and 200 cubits (about 110 m) high, on top of which they allowed for the passage of one quadriga. The river Euphrates is said to have divided the city exactly in two parts. Precisely in the center of each part are localized the two main buildings, the palace and the sanctuary of Bel (for details, see Rollinger 1993). The temple precinct is also square, with a multileveled tower at its center, the top of which can be reached by a spiral staircase winding around the outside of the building. A similarly fanciful description is offered by Ctesias and some other authors (see Jacobs 2011).

When the German archeologists started their excavations it was this imagined city of miracles they wanted to unearth, a city that had already become iconical over more than 2000 years of tradition. Although the city they found and excavated differed greatly from what the *Histories* told, interestingly enough, Herodotus' report was not just taken as a fictitious and fanciful idea of a super-city written by an outsider but as yielding some sort of fact just needed to be interpreted in the right way. Thus Herodotus' description was still regarded much more to represent true history rather than imaginative literature, and this was still valid until very recent times (see, for example, Asheri et al. 2007; contra Rollinger 2014). Of course, the fundamental problem remained that Herodotus' description did not match what the excavations had unearthed. This was explained not systematically but by offering four different modes of explanation that were thought to be complementary to each other. All four modes of explanation took it for granted that Herodotus had visited Babylon in person and that his information is based on his reporting as an eyewitness (Rollinger 1998). These explanations are:

- a) Herodotus was a credulous and credible and trustworthy reporter, but he was consciously misinformed by his “oriental” dragomans. Unfortunately he believed his informants more than what he actually saw.
- b) Herodotus' report is flawed by some faulty memory and confusions that occurred when he returned to Greece and wrote his *Histories*. There was also the difficulty of distinguishing between what he saw, what he read in contemporary and earlier Greek literature, and what he was told.
- c) Herodotus faced considerable difficulties in his exchanges with local informants because of a strong language barrier. This triggered misunderstandings and misconceptions that have to be taken into consideration.
- d) The fourth explanation is most crucial, since it is directly related to the Persian Empire and to Babylon as a city under Persian rule: What the German excavations unearthed is the city of Babylon during its alleged

heyday, i.e. during Neo-Babylonian times, when kings such as Nebuchadnezzar decorated the Babylonian capital with splendid buildings. What Herodotus describes is, partly, fantasy, indeed, but partly it reflects a totally changed and different city. This change is due to Babylonian rebellions that took place during the reigns of Darius I and Xerxes I. The Persian kings, especially Xerxes, are thought to have severely damaged the city with its walls and sanctuaries. After this supposed rupture, Babylon was in decay. What Herodotus saw was a city partially in ruins. He mixed up what he personally encountered and what he was told of Babylon's past. The result is his famous description in the first book of the *Histories*.

This traditional picture, developed by modern scholarship, was further underpinned by three general assumptions and one piece of evidence.

With Persian occupation, Babylonian history in its traditional form came to an end. The kings were foreign kings, who no longer respected the city in the way it was respected in the preceding millennia. Consequently, they reduced their engagement in building activities and public assistance. This is supposed to have been especially true of the renovation of the city walls and the royal engagement for the sanctuaries, which both allegedly came to an end. In particular, it was the famous Tower of Babel that supposedly was in a process of ongoing decay after Xerxes I suppressed two Babylonian revolts and allegedly destroyed the main sanctuary (cf., for example, George 2005/2006, 2010).

Again, classical sources were adduced as chief witnesses for this view. On the one side, the Alexander historians reported that Alexander, when entering the city, found the Tower of Babel in ruins due to preceding Persian demolition. On the other side, it was once more Herodotus who was quoted as principal witness. Wasn't it he who told that Xerxes robbed a statue from the Bel temple in Babylon (1.183), and reported that Darius besieged the city and tore down the walls after his victory (3.151–9)?

There was also the general picture, conveyed by classical sources, of Xerxes as a tyrant and despot, an "Asian king" par excellence, who was imbued with hubris and disrespect toward other cultures and customs. What he supposedly did in Athens, where he destroyed the main sanctuary on the Acropolis (an event that shaped not only Greek but also western historical consciousness), could easily be transferred to Babylon and be interpreted as an analogous action (Wiesehöfer 2017).

Finally, there appeared to be hard evidence for all these assumptions. Since it originated from cuneiform documents and was not manipulated through the lens of classical sources, it was believed to convey the most important argument. Cuneiform tablets clearly document four uprisings against Persian rule, two against Darius and two against Xerxes. The general outline of the

two rebellions against Darius are rather well documented by Darius' Bisitun inscription that refers to a certain Nidintu-Bēl (DB §16–20) and a certain Arakha (DB §49–50). Both pretenders claimed to be Nebuchadnezzar, son of Nabonidus, and both were defeated, Nidintu-Bēl by Darius himself, Arakha by Darius' general Intaphernes. However, although Darius boasts to have punished the two usurpers severely (Nidintu-Bēl was killed, Arakha impaled), he does not mention anything about destructions within the city of Babylon, neither during the combat operations nor afterward, as a kind of punishment. Both kings are also attested in the dating formulas of cuneiform tablets originating from Babylon and some other cities of Babylonia. There they just appear as "Nebuchadnezzar, king of Babylon (and the lands)." It has become common to designate one as Nebuchadnezzar III and the other as Nebuchadnezzar IV, both reigning only for some months in 522/1 BCE (for details see Lorenz 2008; Bloch 2015).

The two uprisings against Xerxes are more complicated. They are only attested by dating formulas, where first a Bēl-šimānī and second a Šamaš-erība claim to be "king of Babylon and the lands," i.e. king of the Achaemenid Empire as a whole. Until recently, the exact dating of the two usurpers was unclear but they can now be placed firmly in the second year of Xerxes, i.e. 484 BCE (Waerzeggers 2003/2004; Oelsner 2007).

Against this backdrop, important questions arise that are directly connected with the city of Babylon under Persian rule. Was there a major change concerning the defense structures of the city? Were the city walls torn down? Did the main sanctuaries, the Marduk temple Esagil and the Tower of Babylon Etemenanki, survive Persian rule? Was there still Babylonian cult activity in its traditional framework? Were there major destructions within the city? Did Babylonian history come to an end with Persian rule? Was Persian rule a major rupture for Babylonia, and which role did Xerxes play in this context? It may not be a surprise that scholarship is divided in replying to these questions, and that there is no consensus on how to evaluate and assess the different data and to define what Persian rule meant for Babylon and Babylonia. However, some points have become clear in the past two decades.

Herodotus does not report Xerxes' abduction of the Bēl statue in the main sanctuary of Babylon – he calls Bēl's statue *agalma* – but of another, probably votive, statue, which he calls *andrias* (pace Hackl 2016: p. 140; cf. Kuhrt 2014).

The Alexander historians are not reliable sources in contrasting Alexander's alleged policy toward Babylon with Persian rule. Although some of these sources may sound authentic and contemporary, their attitude reflects propaganda much more than reality. Alexander and his entourage had a huge interest in slandering the Persians for their alleged intolerance and tyranny and in presenting Alexander as a true Babylonian king (Henkelman et al. 2011).

There is no archeological evidence for any destruction in Babylon during Persian times, affecting either the walls or any sanctuary. This is also true for the Tower of Babylon Etemenanki: a destruction of its main staircase is highly debated, and even if accepted, it cannot be dated in Persian times (Henkelman et al. 2011; cf. also Miglus 1996). To the contrary, there is archeological evidence for continuity concerning sanctuaries and city walls. What the German archeologists excavated may also represent the Persian as well as the Hellenistic city of Babylon (Heinsch et al. 2011; Kuntner et al. 2011; Kuntner and Heinsch 2013; Messerschmidt 2015).

The traditional cult in Babylon's main sanctuary Esagil continues until deep into Hellenistic times (for details, see below). Concerning Etemenanki, this cannot be definitely proven, but there is enough evidence now to consider it probable. The ziggurat appears in a late Babylonian cultic calendar (BRM IV 25/SBH VII 260f; cf. George 2005/2006 [2008]: p. 77), and in the so-called Esagil tablet. The latter is a famous tablet originating from Seleucid Uruk that describes the tower's dimensions and outline (George 1992: pp. 10–19 No. 13; Oelsner 2002b: pp. 19–20 n. 59, 1999/2000: p. 375). One may minimize this testimony and take the tablet's content as “one of academic training rather than practical architecture” (George 2005/2006 [2008]: 78; see also below), but there is another tablet (BM 119282) that makes a completely functional Etemenanki in Persian times very probable (see Pongratz-Leisten 1994: pp. 218–220, No. 6, and the improved readings offered by George 1997c and Lambert 1997 [1999]: pp. 74–78). Paleographically the text dates “in the period of the Late Babylonian empire or the Persian rule over Babylon” (Lambert 1997 [1999]: p. 74). It attests several “seats” (*šubtu*) of Bēl, and one of them is defined as seat of Bēl in Etemenanki (line 15: *šū-bat^a bēl šá é-te-me-[en-an-ki ...]*). It is difficult not to understand this important testimony as referring to Marduk's presence in the sanctuary, be it as anthropomorphic statue or as a divine symbol erected on the tower. Obviously, this implies a ziggurat that is still in function during Persian times, and, by the way, disproves Herodotus' assertion (1.181.5) that the sanctuary (*neos megas*) on the tower did not host any cult image (*agalma*). Finally, a historical-literary text from the Catholic University of America (Washington D.C.), the copy of which dates between the end of the fourth century and the beginning of the second century BCE, i.e. either in late Persian or in Hellenistic times (CUA 90), may also have some relevance. The text seems to focus on Nabopolassar, the famous founder of the Chaldean dynasty, who defeated the Assyrians at the end of the seventh century BCE and freed Babylon from foreign rule. The Babylonian king is celebrated as a hero, in stark contrast to his predecessors. He is hailed for having re-erected the main sanctuaries and the city walls after they have been destroyed. In this context not only Esagil but also Etemenanki and the city walls that still touch the heaven are mentioned (Da Riva 2017).

Since Nabopolassar is praised as a role model for any contemporary king, the message of the text works only if the sanctuaries mentioned as well as the city walls were still standing and in good shape. Every king, present as well as future, was thus exhorted to act as Nabopolassar and take care of the city as well as of its sanctuaries.

However, there are also significant changes during Achaemenid times that cannot be ignored. There is a cluster of 24 well-known private archives, all of them originating from north Babylonian cities such as Sippar, Babylon, Borsippa, Dilbat, and Kiš, that come to an end with the years Darius 35 (4), Darius 36 (1), Xerxes 01 (09), and finally Xerxes 02 (10) (Waerzeggers 2003/2004: pp. 156–157; Oelsner 2007: p. 292). Although “the end of archives” is not total – there is no break at all in south Babylonian cities such as Uruk and Ur, and there are archives from north Babylonian cities like Borsippa, Babylon, Kiš, und Kutha that are well attested after Xerxes 02,¹ partly even through the reigns of Artaxerxes I and Darius II – it has been argued convincingly that the break with Xerxes 02 has to be connected with the two rebellions of Bēl-šimānni and Šamaš-erība. Since the owners of these archives represent the urban elites that, by virtue of their privileged and hereditary participation in the cult as prebendaries, were deeply involved in the administration of the Babylonian temples, a major social and economic change becomes visible that affected north Babylonian cities at the beginning of Xerxes’ reign. This is also evident in the different social profile exhibited by the owners of those archives that remained unaffected by the break of Xerxes 02. They were much more dependent on the Persians for their livelihood and acted as caretakers of Persian estates. This clearly shows that Xerxes did not just crush the rebellions but grasped the opportunity for taking action in order to deprive traditional north Babylonian elites of their power base (Jursa 2013).

The changes inaugurated by Xerxes appear to have affected north Babylonian families even outside north Babylonia proper. Thus north Babylonian families that held important administrative functions in south Babylonian temples, like in the Eanna of Uruk, disappear between the end of Darius’ reign and the beginning of the reign of Artaxerxes (I ?) (Kessler 2004: pp. 240–247). This phenomenon seems to be somehow related to a larger development concerning the cultic activities in Uruk during Persian times, visible in the growing dominance of the cult of Anu and his Reš sanctuary and the diminishing relevance of formerly much more important cults around Ištar and Nanā in Eanna (Kose 1998: pp. 12–16; Kessler 2004: pp. 250–253). This transition may have been supported by a long-standing antagonism between Uruk and Babylon reaching back as far as Assyrian times (Frahm 2002: pp. 96–97).

What we see are important changes, indeed, but they are by no way overarching. Again, there is no indication of a decline of Babylonia or a decay of Babylon, its city walls, and sanctuaries during Persian times (Joannès 2002: p. 144; Kuhrt

2002: pp. 488–490, 2010; Kessler 2004: p. 253, 2005: p. 271). There was no change in the course of the river Euphrates (Rollinger 1998), and there was no change in royal titles after Xerxes 02. The Achaemenid kings were still “kings of Babylon and the lands” (Rollinger 1999). What Xerxes did was to intervene in the household organization of the temple. This was nothing completely new but a royal prerogative that was practiced as well by many of his predecessors (Kessler 2004: p. 251, 2005: pp. 271, 284; cf. also Jursa 2007: p. 77 with n. 7). Thus the changes enacted at the beginning of Xerxes’ reign are harsh indeed, but rather administrative than cultic-religious (Joannès 2002: p. 144; Hackl 2018).

Again, this becomes fully comprehensible only if one takes into account a larger context. Since Darius’ reign, economic and tax pressure in Babylonia had increased, combined with a growing trend toward monetization (Jursa 2007: pp. 86–89; Hackl 2016). This was due, on the one side, to the long and intensive wars at the beginning of Darius’ reign, on the other, to the large building programs that the Persian king had to finance. The larger part of these building programs took place outside Babylonia, in the new centers of Persian power such as Persepolis, Susa, and Ekbatana. Whereas during the Neo-Babylonian Empire Babylon and Babylonia, to a considerable degree, benefited economically from the revenues of a large empire, such revenues now flowed out of the country. This process started already with Cyrus but increased with Darius. As we know from the Achaemenid royal inscriptions, Xerxes was eager to follow in the footsteps of his father, not least in continuing the large building programs. The upheavals in the violent transition from Teispid (Cyrus and Cambyses) to Achaemenid (Darius I and his successors) rule especially affected Babylonia. These uprisings may already have been related to increasing economic pressure. For the two rebellions against Xerxes, this connection is highly probable.

Given this background, it is no surprise that Xerxes was eager to eliminate that Babylonian class that was so resistant toward Achaemenid rule and its new administrative and economic policies. It was also this class that blocked direct access to the financial and economic control of the huge temple economies and their revenues. It is true that, in general, such intervention could affect cultic practices as well, as we have seen in Uruk. There, however, the Persians did not stop traditional cultic practices but fostered a certain cult at the expense of another. This demonstrates that the Persians had considerable interest in the continued existence of the local cults and the temple economies related to them, for they were a major source of income. They were just seeking a much more efficient and direct control of these incomes, which, as we have seen for Xerxes’ reign, required the elimination of a whole class of Babylonian elite families that lost their privileges. Without any doubt this was a major change. It showed that Babylon and Babylonia were no longer the (only) center of the dominant empire.

However, at least as far as we know, this change did not affect Babylon’s infrastructure. The Persian kings were still eager to present themselves as Babylonian

kings. Although we do not know whether the Achaemenid kings participated in the celebration of the Babylonian New Year festival, Babylon's major temples still existed in late Hellenistic times. Through a Babylonian lens, the city of Babylon remained the cosmic center of the world, as it had been since the second millennium. The Achaemenids did not really break with this conception (Oelsner 2002a,b; cf. also Wieschöfer 1999). Moreover, Babylon's significance as a center of learning and tradition is well attested through Seleucid and Parthian times (Clancier 2009, 2011; Messerschmidt 2015; Ossendrijver 2018). This is attested by temple ritual texts (Linszen 2004), chronicles (van der Spek 2003: p. 290 n. 1), topographical texts, and cultic compendia (George 1997a,c), and it is exemplified especially by the series Tintir that describes Babylon's unique status in an encyclopedic way (cf. George 1997b: pp. 137–145 with a reference to BM 87224, copied in Parthian times). This also applies to those ritual texts that pertain to the annual New Year festival (Pongratz-Leisten 1994; Lambert 1997 [1999]). Of course, one may argue that these texts are just academic witnesses of a self-referential class of scribes who lived in the past and indulged in tradition (Kessler 2006: p. 278; George 2005/2006 [2008]: pp. 77–78, 89). But this *caveat* is based upon the premise that tradition in Hellenistic times lacked any background in reality (cf. Oelsner 2002b: p. 30 n. 110). This is not really convincing, especially when we take into consideration those testimonies that attest cultic activities through Parthian times. Thus, Esangila is well testified in late Achaemenid times (VS 3.187 = NRVU 473), when we still face a “scribe of Esangila” (dated Artaxerxes [I, II or III?] 13): Oelsner 1999/2000: p. 377 n. 39. Astronomical Diary –366 mentions the temple (Berkthold 2005: p. 116), and further evidence can be adduced until the first century BCE (George 1997b: p. 136 with n. 34; Oelsner 1999/2000: p. 376, 2002b: pp. 11–17, 19 with n. 58–9; Hauser 1999: p. 225–226).

It seems that we also have to reckon with fully intact city walls all through Parthian times. Persians, Seleucids, and Parthians were actively engaged in maintaining these walls that are attested at least until 91 BCE (George 1997b: p. 136 with n. 35). Thus there is no evidence at all for their alleged “ferocious finality” in Xerxes' reign (George 1992: p. 349). Even in Arsacid times the city might still have had about 100–130 ha and 20 000–30 000 inhabitants (Hauser 1999: p. 228).

Finally, let us return to the undeniable changes that took place around Xerxes 02. The much debated “end of archives”² does not refer to a hasty action but, on the contrary, to a conscious act of record-keeping. The texts were sorted out carefully, which, for sure, took some time (Waerzeggers 2003/2004: p. 162a). As Michael Jursa puts it, “this sifting of the records occurred when the royal administration demanded administrative changes after the suppression of the revolt: in the light of the evidence of the private archives from Babylon, Borsippa and Uruk, it seems highly likely that the old class of administrators was removed from office and new men were brought in, who began by drawing up accounts

and getting rid of the cumbersome old archive. Had the temple been sacked and the cult entirely disrupted, no one would have gone to so much trouble” (Jursa 2007: p. 91; see also Jursa 2004: p. 193).

What does all this evidence mean for asserting Persian rule in Babylonia in general and Xerxes’ reign in particular? Based on the evidence we just discussed, Xerxes appears much less as a destroyer of temples and sanctuaries (cf. Funke 2007; Wiesehöfer 2017) than as a radical administrative reformer (Hackl 2018). The splitting of the huge province of “Babylonia and Transeuphratene” into two smaller units, Babylonia versus Transeuphratene, also took place during his reign (Klinkott 2019). Although administrative reforms continued also after Xerxes’ reign – thus the office of a “city governor” (*šākin-ṭēmi*) was abolished only later (pace Hackl 2016: p. 141; cf. Waerzeggers 2003/2004: p. 173, Addendum) – Xerxes played a crucial role in this process of transformation (Hackl 2018). This picture perfectly fits into what recent research has worked out on the second Achaemenid king (Wiesehöfer 2007 is basic). As son and successor of a usurper king he can be regarded as the actual founder of the new Achaemenid dynasty. He not only took over the newly established empire from his father but had to secure it for his family and successors. This implied putting the empire and its administrative structure on a firm basis that guaranteed its and the dynasty’s existence in the future. One of these measures greatly affected the old elite families of northern Babylonia that were eliminated. That such a harsh step might have resulted in social upheaval and a bad reputation for an active and vigorous king is no surprise (for scholarly innovations by priests associated with the Esangila temple during Xerxes’ reign see Ossendrijver 2018). Such a biased view can be clearly recognized in our sources. However, it is the task of critical historians to look behind the curtain and to disclose the intentions and agendas of these very sources. Certainly, for Babylonia, Achaemenid-Persian rule brought change, but a change that is much more adequately described as transition than as rupture. The country began to lose its central and unique position within the empire. Babylonia more and more resembled a “province,” one of the most important ones, but a “province.” The last point also has major consequences for our modern assessment of Babylonian documentation for Persian history and beyond. The sources, still rich, from various Babylonian cities steadily become sources more and more relevant for Babylonia proper than for the empire as a whole.

NOTES

- 1 For the reign of Xerxes there are now 240 cuneiform tablets available. About 150 date before Xerxes 02, about 90 date after Xerxes 02, the rest cannot be assigned to a specific year (Oelsner 2007: p. 293).
- 2 “End of archives” means that most of the private archives of Babylon appear to have stopped cuneiform documentation around Xerxes 02.

FURTHER READING

Excellent overviews on the state of research for Babylon in Persian and Hellenistic times can be found in Messerschmidt (2015) and Heller (2010). The economic developments in Babylonia are analysed in detail by Jursa (2014). For an assessment of Herodotus as a source for the history of Babylon see Rollinger (2014). The influential receptive histories of Babylon are masterfully exemplified by Scheil (2016). The ideologically-charged views on “Oriental” cities are unfolded and deciphered by Liverani (2016). The vivid debates around Babylon in Persian times are summarized by Henkelman et al. (2011), Waerzeggers and Seire (2018), and Klinkott (2019).

CHAPTER 37

The Persian Gulf

Daniel T. Potts

Introduction

Despite the proximity of the Persian Gulf to the many successive states that have occupied some or all of the Iranian mainland, the geo-political significance of this shallow, epicontinental sea cannot be assumed in all periods. Throughout the third and most of the second millennium BCE, for example, the various incarnations of the Elamite kingdom showed little interest in the Persian Gulf. Nevertheless, maritime connections between Susa and Dilmun (Bahrain) are attested in the Old Babylonian period, and the Kassites and Middle Elamite rulers, perhaps due to ties fostered by inter-marriage between their royal houses, may have had their own spheres of influence in the region, the Kassites in the north (including in Bahrain) and the Elamites in the south (including in Oman). During the first millennium CE the Persian Gulf functioned as an easily navigable trade route, but the evidence of either Parthian or Sasanian political and military hegemony is sporadic at best, and evidence from the early Islamic era is meager to say the least. In the mid-tenth century the Buyids briefly extended their rule to Oman and a century later the Seljuqs followed suit. The Salghurid Atabegs of Fars took over Kish in the early thirteenth century, quickly extending their conquests to Basra, Bahrain, al-Qatif (eastern Saudi Arabia), and Qalhat (Oman), and when Bahrain was sacked by Qutbu'd Din in 1331/2 all of these emporia became nodes in the commercial empire of the kingdom of Hormuz, the wealth of which was immortalized

A Companion to the Achaemenid Persian Empire, Volume I, First Edition.

Edited by Bruno Jacobs and Robert Rollinger.

in Milton's *Paradise Lost* (PL 2.2). But "Iranian" domination of the Persian Gulf never again equaled what the kingdoms of Kish and Hormuz had achieved and during the Safavid period, when Iran was finally unified politically, the Persian Gulf – more specifically Gombroon (later renamed Bandar Abbas), Hormuz, Qeshm, Larak, Julfar, and Bahrain – became of interest only once foreign powers (Portugal, the European trading companies, and Oman) appeared on the scene. Portugal was the principal naval power in the Persian Gulf during the sixteenth century, the Dutch (and less so the English) during the seventeenth and early eighteenth centuries, and the English during the late eighteenth and nineteenth centuries. The Safavids and Qajars, for example, were far more concerned with their terrestrial neighbors – the Ottomans in the west; the Russians in the Caucasus; the Uzbeks in the northeast; and the Mughals and Afghans in the east – than they were with the Persian Gulf (Floor 1987: pp. 31–32). Thus, we should be wary of assuming that, just because it bounded southern Babylonia, Susiana, and Persis, the Persian Gulf was of major concern to the Achaemenids.

The Persian Gulf and Its Iranian Islands

In one of his trilingual (Old Persian, Elamite, and Akkadian) inscriptions at Suez (DZc, §3.7–12), Darius commemorated the opening of "this canal from a river by name Nile which flows in Egypt, to the sea which goes from Persia," and says that "ships went from Egypt through this canal to Persia" (Kent 1953: p. 147; Lecoq 1997: p. 248). In reality the "sea which goes from Persia" was of course the Red Sea, but in describing it in this way, Darius foreshadowed the Greek convention of using the hydronym *Erythraean Sea* to denote the combined waters of the Persian Gulf, the western Indian Ocean, and the Red Sea, all of which was conceived of as an uninterrupted body of water. Moreover, Darius' statement implies that the Persian Gulf itself was under Persian control, or at least not hostile, since ships traveling from Achaemenid Egypt to Babylonia or Susiana sailed through it.

Indeed, given what we know about the populations in mainland eastern Arabia and Bahrain at that time, it would be difficult to imagine the existence of any sort of anti-Persian resistance in this politically disunited area dominated by communities engaged in date-palm horticulture, herding, fishing, pearling, and maritime trade. In the immediately pre-Persian period there may have been a Babylonian governor in Dilmun (i.e. Bahrain, see below), and before that several kings of Dilmun and a king of Izkie in Oman had sworn fealty to the Assyrians (Kessler 1983; Potts 1985b), but no state or dynasty, that we know of, existed in the region when the Achaemenid Empire was established.

It was perhaps because of the very absence of strong political authority that the area was not constituted as a satrapy on its own but was instead absorbed by Darius into the fourteenth satrapy. This, according to Herodotus, comprised an amalgam of “Sagartians, Sarangians, Thamanaeans, Utians, Mycians, and the inhabitants of the islands in the Erythraean Sea...who together contributed 600 talents” (*Hist.* 3.93). While the first four groups were all located in continental (greater) Iran, the Mycians (OP Mačiya) lived in Oman (OP Makā). Despite the often repeated view that the region known to the Achaemenids as Makā (cf. Akk. *Makkan*, El. *Makkaš*) was located in the Makran area of southeastern Iran and southwestern Pakistan (e.g. Eilers 1983), the evidence for locating it in Oman is compelling. In brief, the Achaemenid trilingual royal inscriptions give its Akkadian equivalent as Qadē/ū, while the no longer extant Ištar Slab inscription from Nineveh records Assurbanipal’s receipt of tribute from Padē, king of Qadē, whose capital was at Is/zkie. This is, in all likelihood, identical with Izki in the interior of Oman, considered in local oral tradition to be the oldest town in Oman (Potts 1985a,b, 2010: p. 529). In addition, the Persepolis fortification tablets refer to “Arabs/Arabians” (El. *har-ba-a-be*; cf. OP *arabāya*) from Makkaš (PFa 17, PFa 29, PF 2050) who received rations for travel between Susa and Makkaš (de Blois 1989).

The Mycians, as Herodotus called them, appear as the Mačiya in five Old Persian texts from Naqš-e Rostam, Susa, and Persepolis dating to the reigns of Darius, Xerxes, and Artaxerxes III (DNa 30; DNe 29; DSe 23–24; XPh 25; A³Pa 30; Vallat 1993: p. 164; Lecoq 1997: pp. 271–272 [attrib. Artaxerxes II but note Schmitt 2009: p. 37 who convincingly attributes this inscription to Artaxerxes III on linguistic grounds]). They are depicted on Darius I’s Šallufa stele, on his Egyptian statue from Susa, and on the tomb reliefs of Darius I at Naqš-e Rostam and Artaxerxes III at Persepolis (Schmitt 2009: p. 41) where they are shown naked from the waist up, wearing a belted kilt or loincloth. Their distinctive short sword, slung from a strap over the left shoulder, is reminiscent of examples found in many Iron Age graves throughout the Oman peninsula (Potts 1998: pp. 192–195, Figs. 5–10).

Finally, two of the Persepolis Fortification tablets (PF 679–680) confirm the presence of a satrap in Makkaš. In 505/4 BCE, the satrap Irdumašda, who clearly bore a Persian name (**Ṛtāmazdā*; Tavernier 2007: pp. 297–298), received a ration of wine at Tamukkan/Taocê (PF 679; on their identity see Tolini 2008), inland from modern Bushehr, while in the second text (PF 680), the date of which is damaged, the satrap Zamašba (**Jāmāspa*; Tavernier 2007: p. 220), who also received wine, is said to have gone to the king (Hallock 1969: p. 23).

As for the islands alluded to by Herodotus, none of these is mentioned by name, nor do they appear in either the Achaemenid royal inscriptions or the

Persepolis fortification texts. We learn the names of those closest to the Iranian coast, however, in Arrian's account of Nearchus' voyage from the mouth of the Indus to Susa, almost immediately after the demise of the Achaemenid empire. If we ignore those islands mentioned by Arrian that were situated off the Makran (Gedrosia) coast in the Arabian Sea and begin with those located in the Straits of Hormuz, the first inhabited island noted was Oaracta (Ὀάρακτα), a "large, inhabited island ... Vines and date-palms grew there and it produced corn; its length was 800 stades" (Arrian, *Ind.* 37.2; var. Δύρακτα, Δῶακτα [Strabo, *Geog.* 16.3.7]; Oracla [Pliny, *Nat. Hist.* 6.28], Δῶρα [Steph. Byz., ed. Meineke 1849: pp. 250–251]; Oracea [Rav. Anon., *Cosmog.* 5.17]). The identification of Oaracta with Jazireh-ye Qeshm, the largest island in the Persian Gulf, was long ago established on the basis of the toponym Broct/Burkhut, which appears as the name of a town on the island or as the island itself, in medieval Arabic and early modern (e.g. Portuguese) sources and is cognate with Oaracta (Potts 2020 with earlier lit.).

After describing several more uninhabited islands, Nearchus reached Cataea (Καταία; cf. Catag(i)a, Rav. Anon., *Cosmog.* 5.17), described by Arrian (*Ind.* 37.10) as "a desert, low-lying island, said to be sacred to Hermes and Aphrodite.... Every year the people round about send sheep and goats consecrated to Hermes and Aphrodite, which could be seen, quite wild from lapse of time and want of handling." This is modern Jazireh-ye Qeys or Kish.

The next inhabited island mentioned by Arrian went unnamed and was referred to only as "another island, inhabited ... according to Nearchus there is pearl-fishing here" (Arrian, *Ind.* 38.3–4). This is almost certainly Jazireh-ye Lavān, an island c. six nautical miles west-southwest of Ras-e Nakhilu, known to the early Islamic geographers as al-Lar and to nineteenth century writers generally as Shaikh Abu Shu'aib (Busheab, Shaikh Suaib), a place with pearl fishing (Potts 2015).

Apart from Kharg where, in late 2007, a rock-cut cuneiform inscription, allegedly in Old Persian, was discovered (Bashash 2007; very possibly a pre-modern forgery), there is little published archeological evidence from any of the Iranian islands. The inhabitants of these islands were, however, mentioned by Herodotus, who noted that, under the command of Mardontes, "tribes ... from the islands in the Erythraean Sea" took part in the parade of Doriscus. That Herodotus meant islands bordering Iran rather than Arabia is suggested by his description of the inhabitants who "closely resembled the Medes in respect of both clothing and weaponry" (*Hist.* 7.80). Whether the Erythraean islanders resembled the Medes because they had been equipped with Median dress and weaponry for the campaign, or because they dressed and armed themselves in this fashion in their native habitat, we do not know (Potts 2020: p. 388). Logically, it is difficult to imagine islanders from the hot, humid Persian Gulf wearing Median dress when they were at home. Much later,

contingents from the “tribes bordering on the Erythraean Sea,” which could also mean mainlanders from the coastal regions, fought alongside Darius III at Issus under the command of Orontobates, Ariobarzanes, and Orxines (Arrian, *Anab.* 3.8.5).

The islands of the Erythraean Sea also served another function. According to Herodotus, this was “where the Persian king settles the people known as the *anaspastoi*,” i.e. dispossessed (*Hist.* 3.93; cf. 7.80). Although less famous than the Mediterranean island of Elba, where Napoleon famously spent 300 days in exile, the island of Ogyris, where the tomb of the legendary king Erythras (after whom the Erythraean Sea was named according to some accounts; see Burstein 1989: pp. 42–45), performed a similar function for Mithropastes, son of Aristes, satrap of Phrygia. According to Strabo, Mithropastes “was banished by Darius III, took up his residence in the island” and joined Nearchus and Orthagoras “when they landed in the Persian Gulf, and sought through them to be restored to his homeland” (Strabo, *Geog.* 16.3.5). Seemingly banished to Ogyris by Darius III as a result of his father Aristes’ suicide following the battle of Granicus in 334 BCE, Mithropastes had already been there for a number of years when Nearchus arrived (Bosworth 1996: p. 66). Strabo also says that Mithropastes was “in company with Mazenes ... ruler (*hyparch*) of an island in the Persian Gulf ... called Oaracta” and “that Mithropastes took refuge, and obtained hospitality, in this island upon his departure from Ogyris” (Strabo, *Geog.* 16.3.7). Thus, that after escaping detention on Ogyris – presumably facilitated by the collapse of Achaemenid authority and the arrival of Nearchus – Mithropastes made his way to Oaracta, i.e. Qeshm. Strangely, although Strabo cites Nearchus and Orthagoras as his sources, Ogyris does not appear in Arrian’s account of Nearchus’ voyage, nor has it been possible to determine the identity of Ogyris with any certainty, though several possibilities (Hormuz, Lārak, and Masirah, off the coast of Oman) have been suggested (Potts 2020 with refs.).

In any case, the reference to Mazenes, styled “*hyparch* of an island in the Persian Gulf” (Περσικὸν κόλπον) by Strabo, is important, since hyparchs were generally in charge of sub-regions under the authority of a satrap. In this case, it is unclear which satrap (of Karmania? Jacobs 1994: p. 206; of Persis? Petit 1990: p. 214) may have had jurisdiction over the region and whether that was synonymous with the “islands in the Erythraean Sea.”

The Achaemenid Presence on the Arabian Islands

There were, of course, other islands of importance in the Persian Gulf with settled populations off the Arabian coast. In the far north, the site of Tell Khazneh on the island of Failaka, in the Bay of Kuwait, has yielded pottery

and figurines tentatively dated to the fifth/fourth centuries BCE (Salles 1986: pp. 127–128). More important, however, was Bahrain (Sum. Dilmun, Akk. Tilmun, Gr. Tylos, Lat. Tylus). Blessed with artesian springs of fresh water, Bahrain historically produced dates in abundance and served as an entrepôt in long-distance trade between Babylonia, the Oman peninsula, and the Indian sub-continent. Although ancient authors were most impressed by its vegetation (e.g. Theophrastus, *Historia Plantarum* 5.4.7–8; *De Causis Plantarum* 2.5.5; Pliny, *Natural History* 12.21.38–23.40), Bahrain was also famous for pearling (Athenaeus, *Deipnosophistai* 3.146; Theophrastus, *De Lapidibus* 36; Philostratus, *Vita Apollonii* 3.57).

That pearls – very probably from the Persian Gulf – were prized in Achaemenid Iran is well-illustrated by a late Achaemenid grave excavated at Susa, dated numismatically to c. 350–332 BCE, that contained 400–500 pearls and gold spacer beads arranged in three strands (de Morgan 1905; Tallon 1992: p. 242). Bahrain's lucrative pearling industry, combined with its ready supply of fresh water, substantial date gardens, and cotton production (referred to by Theophrastus), must have made it of more than passing interest for the Achaemenids. Scholars have disagreed, however, on the question of whether or not the Achaemenids had a permanent political presence there.

An immediately pre-Achaemenid cuneiform text (VS 6.81) from the eleventh year (545/4 BCE) of Nabonidus, last king of the Neo-Babylonian dynasty, mentions an administrative official (^l*bel pīhāti*) in Dilmun. Although this may have simply been a Babylonian agent responsible for trade between Dilmun and Babylonia (Kessler 1983: p. 152), it could also denote a true Babylonian governor. If so, then with the conquest of Babylonia by Cyrus the Great, Dilmun would have become de facto a part of the empire and henceforth may have had an Achaemenid governor (Salles 1998: p. 53; Potts 2007a: p. 71). Although there is no epigraphic evidence from either Babylonia or Bahrain to confirm this, the archeological evidence is suggestive. An imposing palace built of stone at the main site of Qalat al-Bahrain (Højlund and Andersen 1997: Plan 3; Potts 2007a: Fig. 1), parts of which date to the early second millennium BCE, was occupied during the Achaemenid period (periods IVc–d). The typically Achaemenid bowl form, a shape previously unknown on Bahrain, was introduced at this time (Højlund and Andersen 1997: Figs. 658, 674, etc.; Potts 2007a: p. 59 and Fig. 16.B–8, 2010: Fig. 49.4) and manufactured there. This can be deduced by an examination of the extant examples from Bahrain which are clearly made in a local ware and were not imports from Iran or Babylonia.

Of equal if not greater interest, however, is a glass stamp seal, found just above the floor in room B6 of the palace, showing an Achaemenid “court style” contest scene between a royal hero and a winged bull (Højlund and Andersen 1997: Fig. 734; Potts 2007a: Fig. 16, 2010: Fig. 49.2). At Persepolis, impressions of similar seals were found on treasury and fortification tablets

(Garrison and Root 2001: Pls. 274–275, 279f, 280h, 285h). On the other hand, at Nippur, in Babylonia, seals showing generally similar iconography were impressed on private, economic texts by members of the Murašû family (Zettler 1979: pp. 260–263). Thus, despite the royal iconography, the presence of such a seal does not automatically imply the presence of a holder of high political office, e.g. a hyparch. It could also have been used by an affluent merchant. On the other hand, it is also possible that the élite resident of the palatial building at Qalat al-Bahrain was a merchant who may have functioned as a hyparch. Certainly the building is no ordinary house.

The Persian Gulf as a Maritime Highway for the Transmission of Knowledge

Finally, as shown by DZc, the Persian Gulf was clearly used as a maritime channel. During Darius' reign vessels sailed between Egypt and Persia, but the Persian Gulf's role as a conduit of cultural exchange was much broader. Reference has already been made to the presence of cotton on Bahrain in the early Hellenistic period, and archeobotanical evidence of cotton, in the form of seeds, as well as textile fragments tentatively identified as cotton, have been found in the palatial building on Qalat al-Bahrain (Bouchaud et al. 2011: pp. 410–411). The Indian sub-continent, where cotton was an important cultivar (Boivin and Fuller 2009: p. 162), is the likeliest original source of Bahrain's cotton. But ideas as well as commodities and cultivars circulated through the Persian Gulf as well.

It has long been noted that Mesopotamian methods and parameters were absorbed into Indian mathematical astronomy during the Achaemenid period (Pingree 1974). Specifically, works like the *Jyotiṣavedāṅga*, a manual used to determine times for the performance of Vedic sacrifices, owe a great deal to redactions of the Mesopotamian text MUL.APIN from the seventh/sixth centuries BCE, while the Pāli *Dīghanikāya*, of the fourth/third century BCE, incorporates astral omens taken from *Enūma Anu Ellil*, and the later Sanskrit *Gargasamhitā* includes omens from *Enūma Anu Ellil* and *šumma ālu* that “must have entered India during the Achaemenid period” (Pingree 1982: p. 618). Considering the clearly Mesopotamian pedigree of the esoteric knowledge of mathematics, astronomy, and divination that was transferred from Babylonia to India, it is plausible to suggest that this was facilitated by travel through the Persian Gulf. Nothing suggests that the Achaemenids played a direct role in this transmission. What the Achaemenids did do, however, was to unite these two distant regions – Babylonia and parts of India – under one political system, acting as a facilitator in the transfer of knowledge. The creation of a *pax Achaemenidica* established the conditions under which this type of cultural exchange flourished (Potts 2007b: pp. 126–127).

CHAPTER 38

The Arabian World

David F. Graf and Arnulf Hausleiter

Arabia

In the so-called “Satrapy Lists” of Darius I, the province of “Arabia” or of the “Arabians” (OP *Arabāya*) appears normally between Assyria and Egypt (DB col. 1.15, DNa l. 26f., DSe l. 26, DSm l. 7). This southwestern geographical trajectory suggests “Arabia” should be located between Syria and Egypt, probably in north Sinai, southern Palestine, or northwest Arabia. The exception is Darius’ listing of “Babylonia, Arabia, Assyria and Egypt” (DPe l. 10–12), and that of Xerxes of “Ionians, Maka, Arabia, Gandara, Sind, and Cappadocia” (XPh l. 23–26). In spite of these oddities, under Artaxerxes II or III, there is a return to the normal Darius I sequence of “Babylonia, Assyria, Arabia, Egypt” (A3Pb l. 16–19). The territory of Arabia seems to be within the satrapy of “Beyond the River” or *Ebir Nāhar*, the region west of the Euphrates, a satrapy created sometime after 486 BCE (Stolper 1989: pp. 283–305).

The most recent entry to the “subject peoples” is the Darius statue discovered at Susa in 1972 in which the “subject peoples” are listed in Egyptian hieroglyphs: Arabia appears again between Assyria and Egypt (Roaf 1974: pp. 135–136), but with an additional piece of evidence for location. Of the 24 countries listed, the last four use Egyptian terms: Arabs, Egyptians, Libya, and Nubia (Yoyotte 2013: p. 264). “Arabia” (the XIX satrapy) is designated by the ethnic term “Hakor,” well attested in Egypt for “Arabians” (Posener

1969: pp. 148–150; de Meulenaere 1977: pp. 931–932). The corresponding depiction of the “Arabian” on the Susa statue is more difficult to interpret. He is beardless and bareheaded, with his hair arranged with a bob above his forehead and in back of his head, with his ear uncovered. He wears a tightly wrapped pleated garment from his neck to his feet, with a shawl over his shoulders, its tasseled ends hanging in front. It is similar to the Thracians on the Darius Statue, suggesting a stylistic “convention” (Yoyotte 2013: p. 277 fig. 299). It also differs from the depictions of Arabians elsewhere at Persepolis, such as the Apadana, where the Arabians have goatee beards, or on the Hall of 100 Columns, with full beards. Nevertheless, the Apadana reliefs also depict the Arabians carrying cloth with tasseled corners that mimics their dress (cf. Hdt. 7.69). The problem is that in Egypt most Asiatics are represented with long gowns and shawls (Roaf 1974: p.136). In spite of these stylistic differences, the Darius Statue’s use of the Egyptian term “Hakor” for the Arabians offers a valuable clue to their location and identity.

In contrast, in Herodotus’ description of Darius’ 20 tribute-bearing provinces (3.89–94), Arabia and the Arabs are excluded. With his Greek orientation, the first four provinces are all in Anatolia, and the fifth satrapy is described as extending from the Orontes in north Syria to the borders of Egypt, and includes Phoenicians, Palestinians, Syrians, and Cypriots, but not Arabs, as they were not subject to “tribute” (Hdt. 3.91). As he indicates, along with the Ethiopians and Colchians, the Arabs provided only “gifts,” not “tribute,” an annual “gift” of 1000 talents of frankincense (3.97). Nevertheless, this extraordinary large gift of c. 26 tons must be regarded as part of the Achaemenid imperial taxation, the siphoning off from the substantial commercial profits produced by the Arabian aromatics trade with south Arabia, making the distinction between “gifts” and “tribute” artificial (cf. Briant 2002: pp. 387, 397).

The incorporation of Arabia among the “Subject Peoples” of Darius I (521–486 BCE) suggests it was acquired during Cambyse’s Egyptian campaign of 525 BCE. In his account of Cambyse’s campaign, Herodotus indicates the Arabs were in control of the north Sinai ports between Gaza (Cadytis) and Ienysus. The latter is probably Tell er-Ruqeish, 20 km southwest of Gaza, perhaps the “sealed harbor (*kāru*) of Egypt” that the Assyrian king Sargon II created in 715 BCE (Lemaire 1990: p. 46; Na’aman 2004: pp. 61–63). Beyond Ienysus to Pelusium, he describes the ports as “Syrian,” but this may be an anachronism for the previous Phoenician-dominated eastern Mediterranean coast.

In actuality, Herodotus depicts the Arab penetration to the very borders of Egypt, with the entire Egyptian eastern frontier called “Arabian.” Cambyse’s attempt to cross the north Sinai was so difficult that he was forced to negotiate a safe passing with the local “Arab king,” who controlled the forbidding

“Arab strip” leading into Egypt (Hdt. 3.5–10). At Pelusium, on the eastern edge of the delta, he locates a military post called Daphnae (Tell Defeneh) that faces the “Arabians and Assyrians” (2.30); east of Heliopolis he locates the “mountains of Arabia,” which further east “yield frankincense” (2.8, cf. 124). In the region of Wadi Tumilat near the Suez, he calls the settlement of Patumus an “Arab village” (2.158), probably Tell el-Maskhuta, where Darius I constructed a canal to the Suez Gulf, which Herodotus calls the “Arabian Gulf.” The Wadi Tumilat was the main entry point into Egypt for Arabian trade: excavations at Tell el-Maskhuta have produced Phoenician amphorae, small cubic Arabian limestone altars, and Himyaritic silver coins (Holladay 1997: pp. 435–436). By the Hellenistic period, Tell el-Maskhuta or Pithom (= Egyptian *Tkm*) became known as Heroonpolis and the Wadi Tumilat region constituted the “Arabian” nome (Helck 1977: pp. 398 and 402) because of the influx of Arabians into Egypt through this passageway (Altheim and Stiehl 1975: pp. 360–361).

The Qedarite Kingdom

For the identity of Herodotus’ “Arab king,” the details have to be pieced together from non-official Persian sources. The first clue is the mention in the Hebrew Bible of “Geshem the Arab” as forming part of the opposition to the Judean Nehemiah’s attempt to fortify Jerusalem in c. 445–433 BCE (Neh 2:19; 6:1–2, 6). Further illumination of Geshem is from a handful of epigraphical finds. The first is from Tell el-Maskhuta, where a silver bowl dated to c. 400 BCE inscribed with Aramaic dedicatory to Han-’Ilāt (“the [Arab] goddess”) discovered in a shrine reads: “This is what Qainu son of Geshem, king of Qedar, offered to Han-’Ilāt” (Rabinowitz 1956: pp. 2, 5–7, Pl. VII.a–b: *zy qynw br gšm hmlk qdr lhn’lt*). The date suggests this “Qainu” is the son and successor of the biblical “Geshem the Arab.” The second piece of evidence is an Aramaic text from Lachish in southern Palestine, inscribed on an incense altar of c. 500 BCE belonging to “Iyas son of Mahlay, the king” (*lbnt ‘ys bn mhly hmlk*), suggesting he may be the royal predecessor of “Geshem the Arab.” A third text, a north Arabian Liḥyanite text from al-’Ulā in the Hijaz, is dated to “the days of Gashm son of Shahr and of ‘Abd, governor of Dedan” (*br’ym gšm bn šhr w’bd fḥt ddn*). The expression *br’y* (“in the time of”) implies that the sequence of officials ended with the name of a king, and perhaps the Persian king. If the connection of this “Gashm” with “Geshem the Arab” is accepted (cf. Winnett and Reed 1970: pp. 115–117), it furnishes the dynastic patronym of Šahrū. The later patronym reappears in a recently published stele from Taymā’ that mentions a *Pšgw Šhrw b[r m]lky lḥyn*, i.e. “Pšgw Šahrū son of the King of Liḥyan.” The preceding damaged first line [...*t*] *tym’*

has been restored as “Šahrū, governor (*[ph]t*) of Taymā’,” and this Šahrū is considered the grandson of Geshem the contemporary of Nehemiah, and therefore Šahrū II, who was the brother of the Liḥyanite king. The name Šahrū is derived from the divine name Šahr, an epithet of the moon god. The reappearance of the name in epigraphic and numismatic evidence in Palestine, Transjordan, and north Arabia is considered a product of papponymy, typical of the Qedarite and Liḥyanite dynasties, and it is assumed that the latter was an offshoot of the former kingdom (Cross 1986: pp. 387–391; cf. Eph’al 1982: pp. 204–214). The lack of chronological precision of the texts makes it difficult to know which Šahrū is at stake, and other possibilities exist (see Potts 2010b: p. 44; Fischer-Bossert 2010: pp. 175–176, and Hausleiter below) but are equally theoretical (Potts 2010b: p. 35).

But if this hypothetical reconstruction of the royal lineage of the Qedarite kingdom is correct, the sequence of Qedarite kings for the Persian period can be reconstructed as follows: Mahlay (end of the sixth century BCE), Ilyas (first quarter of the fifth century BCE), Šahrū I (second quarter of the fifth century BCE), Geshem (third quarter of the fifth century BCE), Qainu (last quarter of the fifth century BCE), and Šahrū II (first half of the fourth century BCE): Lemaire 1990: pp. 45–56. More importantly, if the texts are inter-related, the Qedarite kingdom has expanded its territory from Palestine and the Sinai to include the major oases of [Al-‘Ulā] and Taymā’ in north Arabia.

This implies a nominal Persian “takeover” of Taymā’ after the Persian king Cyrus’ defeat of the Neo-Babylonian king Nabonidus in 539 BCE, involving the integration of Babylonian territories in Arabia. Previously, Nabonidus had occupied Taymā’ for a decade (c. 552–542 BCE), taking over the major oases in the Hijaz, killing the king of Taymā’, and defeating the king of Dedan (Gadd 1958: pp. 35–92; Eph’al 1982: pp. 170–191; Beaulieu 1989: pp. 144–185; cf. Livingstone 1989: pp. 97–105). During his tenure at Taymā’, Nabonidus built a palace, fortified and garrisoned the city, and surrounded it with a string of forts (Beaulieu 1989: pp. 171–174). Just south of Taymā’, several Taymā’nite inscriptions are engraved by officials that even mention the Neo-Babylonian king Nabonidus (Hayajneh 2001; Müller and al-Said 2002, and Lemaire 2003: pp. 288–289). At Jabal Ghunaym, 14 km southeast of Taymā’, some Taymā’nite texts mention wars conducted against Dedan, Massā’, and Nabayāt, perhaps connected to Nabonidus’ campaign (Winnett and Reed 1970: pp. 88–107, Nos. 1–44) or the later breakdown of Persian rule (Knauf 1990: p. 214). It is also clear that Nabonidus’ introduction of Aramaic into Taymā’ continued into the Persian period (Degen 1974; Lemaire 1995).

Recent archeological investigations at Al-‘Ulā (ancient Dedan) are also producing new evidence for the Persian period (Al-Said 2010). New Dedanite texts are adding new kings to the dynastic lists and new deities to the pantheon (Al-Said 2011: pp. 196–200), providing new insight into Liḥyanite society at

Dedan (see Farès-Drappeau 2005). The later Lihyanite inscriptions provide for us the names of six kings (*mlk*) of Lihyan and three others of persons of(?) royal lineage without a title, and of(?) six governors (*r'y*), whose reigns are arranged from the late Persian into the Hellenistic eras, c. the mid-fourth to the first century BCE, but the new finds indicate the royal time span must be enlarged to include the early Persian period (Abu al-Hassan 2010), as both Dedan and Lihyan are now mentioned in a south Arabian Sabaeen text dating to c. 600 BCE (Bron and Lemaire 2009). At Taymā', Lihyanite royal dedications indicate their kings had special intimate connections with the settlement in the Persian period (Hausleiter 2010: pp. 233–234 and 258).

The Borders of Arabia

These scattered details make demarcating the borders of “Achaemenid Persia” difficult, if not a “pointless exercise” (Briant 2002: p. 761; cf. Anderson 2010). Although it is commonly assumed that Herodotus’ so-called “Fifth Satrapy” is equivalent to the Persian province of “Across the River” (*Abar Nahara*), this correlation is too simple. Herodotus’ description of the Fifth Satrapy focuses on the coastal regions, probably derived from Hecataeus’ travels, and fails to provide any details of the territorial extent of the Fifth Satrapy, whose frontiers are nebulous at best (3.91). Herodotus’ account of the satrapies also is an “artificial” construction derived from Greek sources, not from official Persian documentation, which includes Arabia among the “subject peoples,” whereas Herodotus excludes Arabians from his “Fifth Satrapy.”

As a result, the size and extent of the Qedarite kingdom is controversial. There are “maximalist” and “minimalist” proposals. Leutze (1935: p. 259 [103]) placed the eastern border of *Abar Nahara* in the middle of the Syro-Arabian desert, and included the Arabs in the satrapy (122 [110]). Most have followed his interpretation, connecting all of the possible epigraphic details of the Qedarite confederation to suggest they controlled the north Sinai, the countryside of southern Palestine, southern Transjordan, and northwest Arabia (Lemaire 1990: pp. 45–56; Knauf 1990: p. 207). More recently, it has been argued the southern borders of *Abar Nahara* were only from Al-'Arish in the west to Transjordan in the east, excluding Arabs from the satrapy and restricting the Qedarites to the Sinai, Transjordan, and north Arabia (Tuell 1991: pp. 54–56). Advocates of this view of a truncated Qedar place Geshem remote from Judah, and interpret his conflict with Nehemiah as a commercial dispute involving the lucrative Arabian incense trade (Eph'al 1982: pp. 211–212; 1988: p. 164; but cf. Eph'al 1998: p. 115, Geshem may have “wielded some influence in Idumaea at the time”). The underlying premise is that there was no cohesive political unification of north Arabia at the time.

New finds provide occasional glimpses into the demography and size of this extensive landscape related to these issues. The presence of Geshem king of the Arabs in southern Palestine once seemed incongruous with the region's population. This situation has now changed dramatically. Since the 1960s, Aramaic ostraca of the fourth century BCE have emerged in the Negev, primarily from Arad and Beersheba. Most are laconic dockets and tax receipts, but the names are interesting. Although Jewish names dominate at Arad (50% of the names), about 12% of the names are Arabic and 14% Edomite. In contrast, at Beersheba, 40% of the names are Arabic and 20% Edomite, with Jewish names representing only 10% (Klingbeil 1992: pp. 83–84; cf. Zadok 1998: p. 792). This suggests a large Arab population was occupying the Negev in the Persian period.

More dramatically, since 1996, thousands of Aramaic ostraca from Idumea in southern Palestine have been accumulating, dated to Persian and Macedonian kings between 362/1 BCE and c. 300 BCE (Lemaire 2006; Porten and Yardeni 2006). The texts are probably from an archive at Khirbet el-Qôm, 14 km west of Hebron. The onomastic analysis of the published texts indicates that as many as 30% of the names are Arabic and 20% Edomite (Zadok 1998: p. 804; cf. Kloner and Stern 2007: pp. 139–144). Several of these mention a “House of ‘Uzza” (*byt ‘z*), apparently a “shrine of ‘Uzza”, the north Arabian deity (Lemaire 2001: pp. 1157–1158, 2007: pp. 65–67), indicating the presence of an Arab population. In addition, 66 Idumaeen ostraca from nearby Maresha, on the borders of the Persian province of Judah, provide 112 more names, with several dozen Edomite and Arab names. One may even mention “Qedarites” and “Arabs” (Eshel 2010: pp. 43–44, no. 11).

The ostraca are located in the province of “Idumea.” Diodorus first mentions the “*eparchy* of Idumea” (19.95) and the “*satrapy* of Idumea” (19.98) in his account of 312/11 BCE, presumably based on the contemporary Hellenistic historian Hieronymus of Cardia. But the creation of this province during the chaotic years of the warring Hellenistic Diadochi/Diadochoi seems unlikely. Far more attractive is the proposal that the province was created sometime between 385 and 352 BCE (Lemaire 1994: pp. 28–30). The ostraca would then reflect Persian administration of the region at the time. Moreover, the onomasticon suggests “Edomite had a special relationship to Nabataean [Arabian]” names (Zadok 1981: p. 82). The assumption Qedarites supplanted the Edomites, forcing them westward into southern Palestine (Stern 1982: p. 25), must now be rejected: Arabs and Edomites are dwelling together in southern Palestine. Geshem also must now be seen as king of a substantial Arab-Edomite population on the borders of Judah in the fourth century BCE. Numismatic evidence enhances the view that the Qedarites were an organized society in north Arabia. Coins have surfaced in north Arabia and Palestine

bearing the name ŠHRW, the patronym of Geshem bn Šar at Dedan (JS 349 lih), suggesting they are associated with the Qedarite dynasty (Rizack 1984; cf. Lemaire 1990: p. 49; Graf 2015: pp. 294–295; pace Gitler and Tal 2006a: pp. 47–51). Although a coin inscribed possibly with GŠM “Geshem” (Huth and Qedar 1999: pp. 295–297) is problematic (Graf 2015: pp. 295–296), other issues appear to be inscribed with the Arab deities al-‘Uzzā and Manāt (Graf 2015: pp. 296–298), suggesting an Arab derivation. These imitation Athenian or Athenian-styled issues are normally assigned to the period from the late fifth century BCE to the campaign of Alexander the Great (Gitler and Tal 2006b: pp. 146–157; cf. Fischer-Bossert 2010: p. 138), and perhaps into the first century BCE (Huth 2010: p. 234). Issues of local “Arabian” character are now appearing throughout north Arabia (Dumah, Taymā’ [Hausleiter 2010: p. 236 n. 41], Al-‘Ulā, Meda’in Salih, and Petra). At Meda’in Salih, there are more than 100 found from recent excavations and assigned to the Hellenistic period but clearly preceding Nabataean coinage (Augé 2010: p. 277, 2013: p. 130; Bauzou 2015: pp. 219–220), though they may be earlier. At Petra, they appear in an early fourth century BCE context (Graf 2013: pp. 32–33), followed by a succession of early Hellenistic Nabataean anonymous issues (Barkay 2011: pp. 67–73). The large quantity at Hegra is diverse and irregular, with variants, implying the longevity of their production that defies compressing them simply into the second century BCE (Huth 2010: pp. 227–234; pace Rohmer and Charloux 2015: pp. 311–312). Dozens more have been found in the Petra region without a specific provenance and are now in the Jordan Ahli Bank Numismatic Museum collection (seen personally by courtesy of the director, Nayef G. Goussous). Their prevalency in southern Palestine/Transjordan and northwest Arabia suggests a mint existed in the region. The date of the late fifth/fourth century BCE suggests an Arabian authority of some importance and influence for the mint. From the epigraphic perspective, several Thamudic texts (JS 695 + 696) from just southwest of Tabuk in northwest Arabia have been ingeniously re-read and appear to mention a “tribe of Gešem,” the dynastic name of the Qedarites (King 1990: p. 691). In addition, recently published ancient north Arabian (“Taymā’nite”) texts from the southern environs of Taymā’ (Eskoubi 1999) contain references to Qedar and Dedan (Hayajneh 2012: pp. 123–139), lending support to the extension of Qedar to Taymā’ and northwest Arabia (Graf 2016: pp. 444–445; and Hausleiter below). One author of a Taymā’nite text near the oasis indicates he “encamped in QDR” (Eskoubi 20, as reread by Hayajneh 2012: p. 127).

For the western frontier of Qedar, the contribution of the Susa statue of Darius’ designation of Arabia as “Hakor” is important. The reference is normally taken to mean the Arab population of northwest Arabia (e.g. the toponym “Hegra” for Meda’in Salih), but Hellenistic coinage of north Arabia suggests an even larger view. Coins in south Arabian script, perhaps in the east

Arabian Hasitic dialect, are inscribed with the name of a dynast called “Harithat king of Hagar,” perhaps from the region of Dumat al-Jandal (Callot 2010: p. 399). Furthermore, “Gerrha,” the name of a major Hellenistic entrepot in northeast Arabia, has been considered a Graecized version of Aramaic *Hagara* derived from the Hasitic dialect **han-Hagar* (Potts 1984: pp. 82–91; cf. Potts 2010a: pp. 528–529, citing W.W. Müller). The problem is the coins of Harithat are extremely rare, and the only provenanced find comes from Susa (Potts 1991a: p. 108). But if these tenuous and precarious connections are followed, the name Hagar may represent for the Persian period the peoples along the trade route from Tell-el-Maskhuta (Heroonpolis) via Petra/Dumah to Babylon (Eratosthenes in Strabo XVI.4.2 [767]). The size and extent of the Arabian “satrapy” may appear gigantic, but it is essentially commensurate with much of the territory ruled later by the Nabataean kingdom.

Arabs in Persian Sources

There are numerous references to Arabs in the Persepolis Fortification tablets, dating from 509 until 493 BCE. PF 1011 refers to 11^{HAL} [*pu*]-*hu li-ba-ip-ha-ra-[be]* or “Arabian servants” (Henkelman and Stolper 2009: p. 300). These “Arabs” (*ha-ra-pe*) who received rations and payments from officials (PF 1477, 1507, 1534, 1539) are from parts unknown. In contrast, the ethnic term “Arab” appears in the PF texts for specific populations within the Arabian Peninsula. At the end of one “satrapy list” (XPh I. 23-26), the province of “Maka” appears with Sakas, Hinduš (Sindh), Kūšh (Nubia), and Arabia (OP Arabāya), peripheral provinces of the Persian Empire. In the Akkadian versions, OP Maka and Mačiyā is rendered by Maka, Mak, or Qadū (the Akkadian equivalent of OP Makā: see Potts 1990: p. 394), but never by Magan, presumably because the scribes were familiar with Babylonian geographical terminology. The PF tablets mention an Iranian satrap at Maka (PT 679, 680) and several others provide the precise location of Maka. PF 679 indicates a supply of wine for the satrap of Maka was shipped from Tamka (ancient Toake), near the port of Būsahr in the Persian Gulf. Two other PF tablets provide the location of Maka. PFa 17 is a record of “travel rations” for official travelers provided at supply stations along the way: 62 free men and 100 slaves are designated “Arabs” (*ha[r-ba]-ja-be*). PFa 29, a duplicate recording of the same group, reveals they were traveling “from Susa to Maka.” Consequently, the location of Arabia for their native province seems highly probable, and a location of Oman (known as Mazūn from the third century CE and later) seems compelling (De Blois 1989: pp. 160–166), perhaps designating even populations on both shores of the Straits of Hormuz (Potts 1990: p. 294, and Henkelman and Stolper 2009: p. 305). Maka also appears on the Darius Susa statue (as XXIII)

after the “Arabians” (XIX) [the sequence of the enumerations in Achaemenid inscriptions has already been interpreted in §1]. The hieroglyphic word *Mak(a)* is a transcription of OP *Maka*, a toponym used for Oman at the entrance to the Persian Gulf. The clothing for the Maka representative is similar to India, despite the distance separating the Gulf from India (Yoyotte 2013: p. 279 Fig. 294, 301). Evidence for Achaemenid presence elsewhere in the Persian Gulf is less impressive. It is assumed Cyrus the Great acquired after his defeat of Nabonidus in 539 BCE the Neo-Babylonian provinces along the Arabian coast, like Dilmun (Bahrain). But at Qal’at al-Bahrain (ancient Dilmun), the evidence for Achaemenid presence is minimal. Excavations have exposed a large palatial building dated to the Achaemenid period based on the discovery of the so-called “Achaemenid Bowl,” a glass seal with an Achaemenid-style court scene, and other finds (Potts 2010a: pp. 523–527). In addition, a number of PF tablets refer to Ti-ll-man or Ti-ri-man-an (PF 19, 202, 389, 1882), which in spite of the orthographic differences with Til-mun (Dilmun) probably refer to the island (Potts 1990: pp. 350–353, 2010a: pp. 528–529).

Arabs also appear in the Murashu archive as one of the landholding groups or *ḥaṭru* associations, dating between 454 and 404 BCE. These groups occupy a region about 100 km² centered around Nippur. Of the 67 organizations listed (see Stolper 1985: pp. 72–79), the ethnic “Arabs” (*Arabaja*) appears once (no. 56). These organizations are designated by various terms, including geographical or ethnic terms. Many of the latter are from distant regions, such as Phrygians, Carians, and Indians (see Stolper 1985: pp. 60–100). The foreman for the Arabs is “Mušezib-Bel” and the territory they occupy primarily grain and orchard lands. These foreign groups are probably descendants of earlier deported populations, serving now as imperial troops. But the identity of these Arabs remains unknown given the available evidence.

David F. Graf

The Oasis of Taymā’ During the Achaemenid Period by Arnulf Hausleiter

Regional and Local Historical Framework

Although there is no doubt about the historical perception of Arabia in the Achaemenid sources, the available evidence from the oasis of Taymā’ allows currently only a very schematic reconstruction of extent and nature of the relations between this major trading post and the political entity “Achaemenid Empire” with its satrapies. Similar to earlier centuries of the first millennium BCE, historical reconstructions have been mainly relying on allochthonous sources (Hausleiter 2012b). However, the number of indigenous albeit “official” sources increases but is still comparatively limited.

Equally, it is debated whether, following the temporary rule of the last Babylonian king Nabû-na'id (556–539 BCE) at Taymā' (between 552 and 542 BCE), the oasis ever fell under Achaemenid "supremacy" (Stein 2020), most probably in the context of Cambyses' Egyptian campaign in 525 BCE (Graf 1990; above; Jacobs 1994; cf. Eph'al 1982 for a possible nominal integration already under Cyrus; also Graf above), since the postulated existence of an Achaemenid governor at Taymā' has not been confirmed (Potts 2010b, 2011). D. Graf in reviewing the role of Geshem the Arab assigns the Qedarite kingdom a key role in administering north Arabia for the Achaemenids (and also before for the Babylonians) from the end of the sixth to the early fourth century BCE (Winnett and Reed 1970: pp. 115–117; Cross 1986: pp. 390–394; but cf. Eph'al 1982: pp. 213–214; Macdonald 1995; Potts 2010b).

The actual implementation of Achaemenid rule (cf. Jacobs 1994) may have been depending much on topography and environment of the area, most probably resulting in a highly differentiated approach in exercising it on (oasis) "cities" and landscapes in between (Knauf 1990; Anderson 2010). As to the postulated "Arab authority" (Graf above), recent evidence regarding imitations of Athena coins from Hegra/Mada'in Salih let Rohmer and Charloux (2015) suggest a second century BCE date against the established fifth/fourth century BCE dating, thus speculating about a Thamudian involvement in local power – consequently of post-Achaemenid date.

In any case, the economic significance for the incense trade (as recalled by Herodotus 3.97) and strategic location of the oasis as well as the choice of Taymā' as residence by Babylonian king Nabû-na'id may have impacted the degree of attention the Achaemenid leadership drew toward this oasis (cf. Knauf 1990), even though its southerly position may not have been of immediate military use for Cambyses, who seems to have been dealing mainly with locations near the coast and the Egyptian delta.

Taymā'

Archeological and epigraphic evidence – though few primary contexts survived – suggest a continuous occupation of the oasis of Taymā' during the Iron Age through the Achaemenid period, implying the uninterrupted participation of the place to the mid-first millennium BCE trading networks of the Near East (Hausleiter and Eichmann 2018). The oasis was located on a branch northeast of the main route connecting south Arabia with the Levant, significant for the contacts between Arabia and Syro-Mesopotamia (Edens and Bawden 1989; Macdonald 1997).

Taymā's role within these networks underwent considerable change when, coinciding with the end of a potential Achaemenid 'supremacy' (if not involved

in causing it), the dynasty of Liḥyān, whose reign at Dedan (modern al-Khuraybah, al-'Ula) started as early as the late sixth century BCE (Rohmer and Charloux 2015), may have expanded its sphere or political and economic influence from its hometown to Taymā' (Buhl and Bosworth 1960–2007) at the beginning of the fifth century BCE (Stein 2020). This is the earliest attested attempt of exercising control of an oasis-based dynasty in northwestern Arabia over an oasis of a distant location. It is in this context entirely unknown whether this included any territorial dimension beyond that of the oasis itself.

One of the most prominent monuments from Taymā' of the Achaemenid period is the so-called Taymā' stone (Briquel-Chatonnet and Robin 1997; Teima 1: cf. Schwiderski 2004). For the first time seen by C. Doughty (1888) in 1877, it was rediscovered in 1884 by Julius Euting (1914) in connection with Charles Huber (1891), who had identified the monument in 1880. The Imperial Aramaic 24-line text carved in positive letters on the arched stele reports the introduction of a new god, ŠLM HGM, to the existing Aramaean deities of Taymā' ŠLM [of] MḤRM, ŠNGL, and ŠYM (Maraqten 1996; Niehr 2014) – ŠLM (the divine name meaning at the same time “image”) in his various facets without question the main god of the oasis. The stele, according to a reinvestigation of its Aramaic inscription by P. Stein (2014), conceived in the style of an ancient Near Eastern legal document, based on the paleography and the number of regal years, can be attributed to either Darius I or Artaxerxes I (Stein 2020), implying that at this time an Achaemenid ruler, though more probably his local administration, was formally involved when a new god was introduced at the oasis of Taymā'. However, paleographic observations on another monument, the so-called al-Hamra stele (Teima 20: Schwiderski 2004) – also bearing an Imperial Aramaic inscription of the same design reporting the installation of a shrine for ŠLM [of] R/DB at Taymā' (most probably that of Qasr al-Hamra itself), and a newly discovered inscription on a fragment of a sphinx found at Taymā' (object no. TA 6223; Hausleiter et al. 2017) – suggest that the end of the Achaemenid influence on or “rule” over the oasis and the establishment of the rule of kings of the dynasty of Liḥyān may have taken place around the same time, i.e. the beginning of the fifth century BCE. The new inscription on the sphinx fragment mentions a “son of PŠGW Šahrū” with the epithet “king.” If the latter can be reconstructed as “king of Liḥyān,” and if his father is the same PŠGW Šahrū as on the al-Hamra stela, an individual “not defined in terms of his political identity” (Stein 2020), it can be suggested that Achaemenid rule in whichever form it was represented at Taymā' was replaced by that of the first representative of the Liḥyānite dynasty at Taymā'.

Following this hypothesis, Achaemenid supremacy over northwestern Arabia – and Taymā' – might have lasted for about 30 years or little longer.

Archeological Data

Numerous inscriptions in Imperial Aramaic are preserved at Taymā', none of them, however, allowing for any interpretations regarding the Achaemenid "rule" over the oasis. In addition to the Taymā' stone, a number of monuments with religious imagery have been found at Taymā' and attributed to the Achaemenid *period* (italics by the present author), suggesting that there was a substantial increase in artistic production during that time, probably also a reaction of the 10 years' rule of Nabû-na'id. Except for the former, these monuments have been discovered in the context of temples and shrines (Hausleiter 2012a).

Of these, only the building of Qasr al-Hamra, located on a rocky ridge in the northwestern part of the walled oasis settlement, and actually remote from the central part of the ancient settlement, has a building stage which may have been in use during the Achaemenid period (cf. Parr 1989), since the al-Hamra stele (see above) and cube were found still in original position, together with other paraphernalia, in a part of the building which was used as a shrine (Bawden et al. 1980; Abu Duruk 1988; Hausleiter 2012a). Based on the inscription of the al-Hamra stele (Livingstone et al. 1983) it can be suggested that this shrine (Room 1 of the early phase of the building) may have been dedicated to ṢLM R/DB; accordingly, a pedestal has been dedicated to ṢLM R/DB. It was not possible to attribute the other shrine identified at Qasr al-Hamra (Abu Duruk and Murad 1986, 1987, 1988) to any deity, although the presence of a stylized bull's head may point to the deity ṢLM, too (Hausleiter 2012a).

Neither of the residential quarter located in the central part of the ancient settlement of Taymā' nor of the large temple building north of it have remains been identified which can be unequivocally attributed to the Achaemenid period, although the pottery sequence suggests an occupation from the time before the mid-first millennium BCE through the first century CE (Tourtet and Hausleiter 2018). The fact that the typical simple straight-walled medium-sized bowls cannot be restricted further in time can be understood as a sign for a continuous and locally shaped pottery production at the oasis during this period. Occasionally attested carinated bowls of a fine fabric from other contexts seem to be of earlier date.

The large temple (Building E-b1) in its preserved building stages goes back to the Nabataean period (Lora 2017) with preceding building stages dated to the period of the dynasty of Liḥyān. It cannot be excluded that there may have been a building of public character of the time of Nabû-na'id, as indicated, for example, by the concentration of a number of fragmentary cuneiform texts and a stele of this king in filling layers from the surrounding areas (Schaudig 2020). In any case, the building and rebuilding operations of the Nabataean period seem to have destroyed much of the remains of the underlying periods

of the Iron Age. During the time of the dynasty of Liḥyān, royal monumental statues, as in Dadan, were erected next to or in the temple of Taymā' (Hausleiter 2018) in association with the repeated placement of dedicatory inscriptions of Liḥyānite kings (Stein 2020).

Textual evidence on the Taymā' stone refers to a "house" of ṢLM HGM (supposedly a temple), but also 16 palm trees of the king's domain as well as five palm trees from the (ordinary?) fields (Briquel-Chatonnet and Robin 1997; Stein 2014). It is at least possible to assume that this passage refers to royal land of the time of either Darius I or Artaxerxes I, the postulated author of the text (see above). However, it does not tell us much about the details of Achaemenid 'rule' over the oasis, which may possibly have to be characterized as of "middle ground" character. Nevertheless, these are the only and few hints to a sub-division of the irrigated cultivation areas of the oasis among different social (and economic) spheres.

The long-lasting tradition of built graves, which during the early Iron Age feature rectangular chambers with large capstones and a door, reaches also the chronological horizon of the Achaemenid period but continues to be expressed as a purely local tradition. The polychromatic painted pottery known mainly from these graves but also attested in the settlement (Sana'iye Pottery) is attested from the end of the early Iron Age onward (Hausleiter 2014). From the late fifth century BCE onwards inhumation burials are attested at Taymā' replacing the tradition of built burial structures.

Iconography

The left narrow side of the Taymā' stone displays two superimposed panels with figural representations. In the upper panel there is a standing figure whose habitus and dress are characterized by Assyro-Babylonian royal iconography and style (see already Euting 1914). The figure's headdress and staff led to the erroneous interpretation as Babylonian king Nabû-na'id sometimes to be found in the literature; although the content of the so-called verse account, a propagandistic text against this king written during Achaemenid rule (cf. Schaudig 2001; Eichmann et al. 2006), would possibly suggest a clear demarcation, it is probably not surprising if the appropriation of Assyro-Babylonian iconography during the Achaemenid period, as evidenced elsewhere, has to be considered an intentional act, though not really in the sense of continuation.

Above this figure, contrary to the representation of moon crescent/disk, winged sun, and star together with the Babylonian king at Taymā' (Hausleiter and Schaudig 2010) and on the newly discovered rock relief at al-Hā'it, ancient Padakku, (Hausleiter and Schaudig 2016), there is a representation only of a winged sun-disk (Dalley 1986), a symbol also characteristic for the imagery of Achaemenid rulers, but in Mesopotamia already used from the

Mitanni (sixteenth century BCE) period onward recurring to its Egyptian origin of even earlier date.

The figure in the lower field – according to the inscription: the priest Šalmu-ušēzib, son of a probably local individual bearing the Egyptian name Pēt-Osiris (Sperveslage 2019) – wears a long garment, similar to that of the royal figure above, but shows an apparent local type of hairdo. The priest venerates a *bucranium* whose identically sculptured counterpart has been found as an artifact in the recent excavations at Taymā' in the fill near the above-mentioned temple building of the Nabataean period. Together with the representation of a standing bull on a relief (Hausleiter 2012a), found in the same area, these images are united by the representation of bulls' heads or bulls without a sun-disk. This may suggest that the predecessor of the Nabataean temple probably hosted a shrine of ŠLM HGM, assuming that these representations can be directly related to text and imagery on the Taymā' stone implying that ŠLM is represented by the bull or a bull's head (Hausleiter 2012a; see already Knauf 1990).

In turn, representations on the al-Hamra cube and the al-Hamra stele (including, on the former, the figure of a priest most similar to that on the Taymā' stone), of bulls or *bucrania* with sun-disk, all found at the site of Qasr al-Hamra in situ by a Saudi Arabian expedition (Abu Duruk 1988; Bawden et al. 1980), may have to be connected with ŠLM R/DB – the other deities ŠLM MḤRM, ŠNGL and ŠYM probably to be associated with the winged sun-disk, moon crescent/disk, and the star, respectively (Niehr 2014). The occurrence of numerous symbols of Egyptian, Syro-Levantine, and Mesopotamian type of al-Hamra stela and cube can be explained with the cosmopolitan nature (cf. Macdonald 1995) of the local religious iconography; the depiction of an incense burner on both, al-Hamra stele (Sperveslage 2019) and cube, may refer to the role of aromatics of south Arabian origin in the liturgy of that time.

The rock carving of a riding horseman showing stylistic resemblances to Assyrian and Achaemenid iconography (Jacobs and Macdonald 2009; *here* Figure 38.1) is possibly best characterized as “iconographic remain” of Nabû-na'id's stay at Taymā' (Niehr 2014), probably similar to the rendering of the royal figure on the Taymā' stone.

Tombstones/Funerary Stelae

Chronologically falling into the Achaemenid period are the north Arabian tombstones or funerary stelae found at Taymā' (Livingstone et al. 1983; Schiettecatte 2010; Hausleiter 2019; Macdonald 2020; Stein 2020), characterized by the schematic representation of a human face often accompanied by an Aramaic inscription mentioning the deceased individual, usually with his filiation.

Figure 38.1 Surroundings of Taymā': rock drawing of a horseman.

To this well-known group of objects – none of them found in primary context – more elaborate specimens have to be added, generally featuring the same stylistic framework as the al-Hamra cube. Until now, three funerary stelae with a carved representation of one or more seated figures on stools and tables have been identified, framed by attendants on trunks of palm trees and a frieze of bunches of vine. Two of them have an Aramaic inscription preserved, placing them on paleographic grounds into a period around the fifth/fourth century BCE. Part of this group is a fragmentary stele found by Charles Huber – without inscription, earlier thought to be of Neo-Assyrian date (Potts 1991b). The only one of these monuments originating from excavations had been carved for a woman whose name is preserved in Imperial Aramaic. This object was used by two further women afterward; their pertaining funerary inscriptions are written in Taymā' Aramaic, respectively in Nabataean, the last one written during the reign of king Aretas IV (Macdonald 2020). Although the apparently significant social status of these women cannot be defined closer, it evokes certain associations with leading Arabian women known from eighth to seventh century BCE royal Neo-Assyrian textual sources.

Another funerary stele of the same date shows an erased Aramaic inscription and sculptured scene of a seated figure, generally similar to the abovementioned representations, but possibly taking up motifs rooted in the Syro-Hittite realm (Hausleiter 2019; cf. Macdonald 1997).

Conclusion

At the current stage of analysis, the Achaemenid *period* at Taymā' is characterized by an increasingly contoured picture with regard to visual representations in the archeological record. Whereas little of the architectural evidence can be characterized as unequivocally of Achaemenid in date, epigraphic evidence may indicate the possible transition from a fairly short-time Achaemenid 'supremacy' toward the reign of the regional dynasty of Lihyān, which in turn used monumental statues and inscriptions for the royal representation at Taymā'. As observed in other contexts in the Achaemenid world, the iconographic "pool" of this period seems to have been translated into the local sociocultural system. Instead, there is no archeological proof of Achaemenid rule over north Arabian oases as nodal points of political power, economic, and cultural exchange.

FURTHER READING

Three contributions (Graf 1990, Knauf 1990, and, more recently, Anderson 2010) have been published on the Achaemenid province of Arabāya, integrating the available historical sources. With regard to history and archaeology on the Arabian Peninsula, in particular Taymā', the contributions by Potts (2011), Hausleiter (2012a,b), and Eph'al (1982) provide relevant information. The catalogue of inscriptions from the excavations at Taymā' has been published by Macdonald (2020).

CHAPTER 39

Egypt

Joachim F. Quack

Conquest

Egypt was the last of the old Near Eastern civilizations to come under Persian rule. At that time it was ruled by the kings of the twenty-sixth dynasty which originated from Saïs and is likely to have descended from a warrior family of Libyan origin. King Amasis ruled for 44 years (570–527 BCE) and established contacts with many rulers of the Mediterranean region, especially in the Aegean. We can suppose that this was at least partly with the intention of building a network against attacks from Asia; he also built up defenses in the eastern Delta. While his rule was prosperous, he had problems with legitimacy, being a usurper who had led a successful rebellion against the previous king, Apries.

Cyrus died before making clear plans for the conquest of Egypt. So it was left to his son and successor, Cambyses, to lead the army against the Nile country (Cruz-Urbe 2003; Kahn and Tammuz 2008). The campaign started probably in 527 BCE and ended successfully in 526 BCE (Quack 2011a). Concerning the reasons for the war, Herodotus (3.1–3) and Ctesias (FGrH 688 F13a) indicate several variants in circulation, all focusing upon a daughter of king Apries called Neïtetis and being either the wife of Cyrus (according to one of the versions, also mother of Cambyses) or of Cambyses himself. At best, that might have been either pretexts or later efforts by pro-Persian Egyptians to link Cambyses in some way, as an avenger or even direct

descendant, with the Egyptian dynasty (comparable to the concept of the Alexander romance to make Nectanebos II, the last indigenous king, the father of Alexander the Great). The real geostrategic reasons for including Egypt in the Persian Empire should be obvious, and it was preceded by taking definitive control of Phoenicia and Cyprus (which previously had been conquered by Amasis; Balandier 2009).

The key to Cambyses' success was an alliance with the tribes of the Sinai who helped him to traverse the waterless desert. He was advised for this by Phanes, a Greek mercenary from Halikarnassos who defected from the service of Amasis and went over to the Persians, providing them with important information about the possibilities of gaining access to Egypt (Herodotus 3.4). Probably less reliable is a divergent report by Ctesias (FGrH 688 F13, § 10), according to which Kombaphis, an influential eunuch of the Egyptian king, delivered the havens and the rest of Egypt to Cambyses. Still, there are possible Egyptian indications for a "collaborator" Ptahhotep (a treasurer) called so and living under Darius I (Posener 1986).

The Egyptian army, led by Psammetichus III, son of Amasis (called Psammenitos by Herodotus and Psammecherites by Manetho according to Africanus, perhaps as a contraction of "Psammetich, son of Neith"), awaited the invaders at the Pelusiac branch of the Nile. In a pitched battle, the Persians were victorious; the Egyptians retreated to Memphis where they were beleaguered and finally had to surrender. The vanquished king was left alive (while his son was killed) for a while but later executed for planning rebellion among the Egyptians. The highly divergent account by Ctesias, who names the Egyptian king Amyrtaios and indicates that he was deported to Susa with a following of 6000 Egyptians, seems less trustworthy, although there are parallels for a fluctuation between Amyrtaios and Psammetichus as names of Egyptian kings.

There are conflicting modern opinions about the degree of violence involved in the conquest (Aufrère 2005). While later claims that all Egyptian sanctuaries were destroyed at that time have been considered by some scholars to be unreliable, even the most pro-Persian contemporary sources do indicate that there were substantial destructions, plundering, and encroachment of the army upon temple territory (Jansen-Winkeln 2002).

Herodotus (2.30) indicates that under Psammetichus, the Egyptians had garrisons in Elephantine against the Ethiopians, in Daphnai against the Arabs and Syrians, and in Marcia against the Libyans, and that the Persians still kept watches in the same places.

According to Herodotus, Cambyses pondered three plans after having conquered Egypt. One was a move against Carthage, which floundered immediately because the Phoenicians who provided the fleet for the Persians refused to go out against their relatives. The other two were operations against the

Oasis of Siwa and against Nubia. While some scholars have doubted the validity of Herodotus' indications, the plans definitely make sense. The western oasis, including Siwa, had been under the control of the Saïtic dynasty, and it would have been an obvious move to secure them for Persia, given their importance for the desert routes (which became increasingly relevant with the growing use of camels at that time). Also campaigns against Nubia were part of the politics of the Saïte kings, thus it would be logical that the Persians followed suit.

Regardless of the sound strategic reasoning, both plans failed on the tactical level. The army sent against the oasis never reached its goal and was said to have perished in a sand storm (Hdt. III, 26). Recently, it was claimed that remnants of this army have been discovered in the Libyan Desert, but there is not yet any formal report to buttress this.

The army against Nubia, led by Cambyses in person, faced logistic problems due to insufficient supplies and finally had to return without (much) success after serious losses (Hdt. 3.25; while in 3.97.2 he mentions that the Ethiopians bordering on Egypt were subjected by him). One of the most (in)famous episodes concerning Cambyses is set here, after his unsuccessful return: According to Herodotus, at that time the Egyptians were holding festivals at Memphis to celebrate the enthronization of a new Apis bull. Cambyses, thinking that they were celebrating his defeat, personally dealt a deadly wound to the animal. As a punishment for his crime, he was smitten with madness by the gods (3.27–30; similar Plut. *De Is. et Os.* 44). Scholars have often discussed the veracity of this statement.

For some time, it was supposed that the actual evidence of Apis burials would disprove the story of Herodotus. We have one epitaph of a bull that was born under Amasis, year 27, died under Cambyses, and was buried in his sixth year; meanwhile, an Apis is attested that was born in year 5 of Cambyses and died under Darius I. Obviously, none of them could be the one born recently and claimed to have been slain by Cambyses. However, since Herodotus tells that the slain one was buried by the priests in secret, we should not expect to find his burial within the normal place in the serapeum. In any case, given that according to Egyptian religious convictions there could be only one living Apis bull at a time, the considerable overlap between the burial of the second and the birth of the first one (at least 15 months) is already a sure sign that something is amiss here, and probably it took the Persian authorities some time to come to the conclusion that accepting the Apis cult (and organizing state-sponsored burials) was ultimately in their own interest and less costly than having to deal with the hurt religious feelings of the Egyptians. While not positively proven, an episode of a slain new Apis in between would by no means be excluded.

Herodotus also ascribes a sacrilegious whipping and burning of the mummy of Amasis to Cambyses (3.16; similar Diod. Sic. 10.14.2). While this cannot

be proven, there is at least some evidence for a persecution of the memory of Amasis in the Persian period (probably limited to the reign of Cambyses). Such a measure would fit well with the effort noted above, in connection with the story about the daughter of Apries, to present Cambyses as legitimate king in contrast to the usurper Amasis.

During Cambyses' stay in Egypt, important decisions were taken concerning the economic situation of the temples (see Chapter 64 Egypt). Cambyses finally left Egypt when a revolt in Persia broke out; he died on the road, as indicated independently by Herodotus (III, 64–66) and a notice on the verso of the demotic papyrus BN 215 (Quack 2011a: p. 234).

Rule and Insurrections

The effects of the foreign rule are likely to have been felt much less intensely by the general population (as long as the overall tax load remained quite similar) but much more profoundly by the elite, whose sources of wealth were seriously cut by the fact that the province had to deliver a surplus to the center of the empire and that foreigners got some of the most important (and lucrative) offices. This is certainly one reason for the fact that archeological remnants from the Persian period in Egypt, especially as far as elite objects are concerned, seem rather elusive.

Still, there was certainly room for some Egyptians to ingratiate themselves with the new ruling power. They have been often dubbed “collaborators” by modern scholars (Huss 1997). Such a label, implying that they worked to the detriment of their own country, might be too negative, given that they achieved benefits for Egyptian institutions also.

The inscription of one of them, Udjahorresnet, is one of the major sources for Egyptian reactions to the Persian kings (Baines 1996). He was commander of ships under the Saïte kings. After the conquest of Egypt by Cambyses, he was made chief physician as well as friend (of the king) and director of the palace (it is less clear whether the Egyptian-style throne-name of Cambyses was really devised at his instigation). He claims to have explained the importance of Saïs to Cambyses and made him drive out foreigners who had settled in the temple area, as well as reinstate the offerings for Neïth (and even to prostrate himself before her in person). Later, he was sent by Darius to Egypt when he was in Elam, in order to restore the temple school at Saïs. Udjahorresnet had a tomb in an elite cemetery at Abusir, and there is an inscription claiming that his statue was restored 177 years after his time (which is likely to fall into the second Persian rule).

Already with the death of Cambyses, problems in Egypt seem to have started. Darius I counted Egypt among those countries that rebelled against

him while he was in Babylon (Bisutun-inscription, § 21). There is some likelihood that testimonies of an Egyptian ruler Petubastis III belong in this period, including letters from a year 1 sealed with his name; and Darius I is not attested in Egypt as a ruler before his regnal year 3. Nothing more is known about this ephemeral ruler, but his name would link him with the traditions of the eastern Delta rulers of the twenty-third dynasty, not with the Saitic house.

The first satrap of Egypt, Aryandes, was installed by Cambyses when he left Egypt and continued in office under Darius I. According to Polyæn. (7.11.7), the Egyptians revolted against his oppressive rule and accepted the Persian rule only when Darius granted a very high amount of money (100 talents) for finding a new Apis bull. If this episode is based on reality, it can only be linked with the time directly following the Apis bull that was buried in year 4 of Darius I, and there it would fit quite well as being shortly after the initial difficulties of re-establishing Persian rule in Egypt. Herodotus IV, 166 f shows Aryandes still in command and leading the army of the Egyptian province for a campaign against Barka. This was the farthest foray of the Persians into Libya, and it is supposed to have taken place at about the same time as Darius' campaign against the Scythians (c. 513/512) (Hdt. 4.145.1). Later Aryandes was accused by Darius of planning rebellion because he was minting coins of very pure silver content, and put to death. The next attested satrap of Egypt was Pherendates.

Darius I is the best-attested of the Persian kings in Egypt. It is well documented that on his initiative all existing laws of Egypt were collected and assembled, probably quite immediately after he reassured Persian rule in Egypt in his third year. Over the next years (until his regnal year 19), they were also translated into Aramaic in order to be accessible to the imperial administration.

Also, Darius finished the canal between the eastern branch of the Nile and the Red Sea; along the route several stelae were erected, with multilingual inscriptions. The Egyptian version presents the king as beloved son of the Egyptian goddess Neith and with an Egyptian translation of the title "great king, king of the kings," and it gives a list of subject countries, while the Persian one adds that he was a Persian who conquered Egypt from Persia. During this time, several Persian expeditions to the greywacke quarries of Wadi Hammamat are attested. That should be linked with the over-life-size statue of Darius I discovered at Susa but, according to the inscriptions, most probably conceived originally for erection at Heliopolis and made from this very stone. The Egyptian inscription on the statue presents Darius in terms of a traditional pharaoh and as son of the god Atum, while the Old Persian inscription claims that the statue was carved so that it was known in future that the Persian man had conquered Egypt (in contrast to the Egyptian text which speaks more neutrally about the commemoration of the name). It is

obvious that these monuments display divergent messages to different audiences. The statue also gives a list of the countries subject to Persia.

It is generally assumed that the temple of Hibis in Kharga Oasis was decorated under Darius I, continuing a building started by the Saïte kings. Actually, things are far from certain. Most cartouches in the inner parts of that temple are left blank (which is normally an indication that during the decoration of such a monument, the political situation was instable, with no clear legitimate ruler) or are, at most, painted in with the name “Darius” in a form not positively attested before the later years of Darius I. It is not proven whether this was Darius I or II. In one case, a Horus name is attested which otherwise is known for Psammetichus II (and different from the safely attested cases for Darius I). A reappraisal might be in order; it is not completely excluded that the decoration started during the Inaros revolt, with later work under Darius II.

Darius I is certainly the Persian king getting the best image among the Egyptian sources; in a note on the verso of the papyrus BN 215 it is told that all districts obeyed him because of the benevolence of his heart. Still, supposed posthumous mentions of him in the context of the authorship of magical and astrological texts have now turned out to be largely based on wrong restorations of badly preserved passages which actually should be ascribed to Nekho II (Nekhepsos) (Ryholt 2011: p. 62).

About 486 BCE, shortly before the death of Darius I, while he was preparing the invasion of Greece, the Egyptians revolted against the Persians (Hdt. 7.1). Their leader can be identified with a king Psammetichus IV whose second year of rule is attested in some demotic contracts belonging to a dossier which starts in the final years of Darius (Vleeming 1991). The name Psammetichus indicates claimed continuity with the twenty-sixth dynasty; it is difficult to ascertain whether this king was really related to the Saïtic royal house. The provenance of the contracts from Hu indicates that the rebels controlled at least part of Upper Egypt. Two inscriptions by Persian functionaries in the Wadi Hammamat, one dating to year 36 of Darius I (486 BCE), the other to year 2 of Xerxes (484 BCE), might delimit the time just before and after the revolt. There is also a demotic letter from Elephantine (pLoeb 1) dating to year 36 of Darius I which speaks of “rebels” moving around the southern border region.

According to Herodotus (7.7.7), Xerxes suppressed the country more heavily than before after having reconquered it and made his brother, Achaimenes, satrap of Egypt. Perhaps this can be linked with an indication in the satrap stela that Xerxes revoked a land grant for the temple of Buto. In any case it is noticeable that at least two substantial demotic private papyrus archives come to an end at about this time, which might be more than simple coincidence.

The most substantial of all Egyptian revolts was the one led by a certain Inaros, who is commonly designated as a Libyan (Hdt. 7.7; the designation as Lydian by Ctesias FGrH 688 F 14 § 36 is an obvious error in the textual transmission; contra Rottpeter 2007) and son of Psammetichus (that might be the Psammetich IV of a previous revolt). The rebellion probably started soon after the death of Xerxes and the ascension of Artaxerxes I in 465 BCE; the most likely date for its beginning is 464 or 463 BCE. An inscription from Wadi Hammamat once adduced to prove continued Persian control there has now been shown to postdate the successful phase of the rebellion (Kahn 2008: pp. 428–429, 433). Inaros' rule is attested in a demotic ostrakon from Manawir in Kharga Oasis (Chauveau 2004), which is dated to the second year of "Inaros, chief of the Bakaloi" (reading with Winnicki 2006). The Bakaloi are a Libyan tribe, thus this note fits with the indication of Thucydides (1.104.1; 1.110.3) that Inaros was a king of the Libyans. Inaros acted together with an Egyptian called Amyrtaios. They started their rebellion at the eastern margin of the Delta, specifically in the city of Mareia, and formed an alliance with Athens which sent battleships to their support. The Persians sent an army against Egypt led by Achaemenes, the uncle of Artaxerxes (Ctesias gives the name as Achaemenides and makes him the brother of Artaxerxes), but they were defeated in the battle of Papremis and Achaemenes was killed. The accounts of the different historians vary as to whether the Athenian help was essential for gaining the battle at Papremis, whether there was rather a separate naval battle in which the Athenian general Charitimides was victorious, or whether the Athenians arrived only after the battle was won and Inaros was in command of practically all of Egypt and two thirds of Memphis.

Still, the Persian garrison at Memphis withstood the siege, and meanwhile the Persians prepared a large army led by Artabazus and Megabyzus which assembled in Cilicia and Phoenicia. It marched against Egypt (probably in 460 BCE) and broke the siege of Memphis. The rebels and their Athenian allies retreated to the island of Prosopitis in the eastern Nile Delta where they were beleaguered for some time, perhaps as long as 18 months. Finally they were forced to capitulate. The Athenians seem to have reached a settlement which allowed them to return, via Libya, to their home. Inaros was led to Persia and finally crucified.

Amyrtaios remained independent in the Egyptian marshes where the Persians were unable to get him, and he had still help from Athens (Thuc. 1.112), but the rest of the country was brought back under Persian control. According to Herodotus (3.15), the Persians were accustomed to giving back the rule even to the sons of rebellious kings, and as examples he gives Thannyras, the son of Inaros, and Pausiris, son of Amyrtaios, indicating that Inaros and Amyrtaios had made the Persians more trouble than anybody else.

After the Persians had regained possession of Egypt, a certain Sarsames was installed as satrap according to Ctesias (FGrH 688 F 14 § 38); probably this is to be recognized as a slightly garbled form of Arsames, who is known as satrap of Egypt between 435 and 407 BCE according to other sources. Since there is no other satrap of Egypt attested after the Inaros rebellion, it is likely that his tenure started directly after the end of that rebellion.

A group of Aramaic documents written on leather and mostly emanating from Arsames and his surroundings is likely to belong to the immediate aftermath of the Inaros revolt, since the documents show how problems were settled concerning property rights related to the effects of an Egyptian insurrection, and in one passage, even the name of Inaros (as leader of the enemies) is, in spite of partial damage, still likely to have stood (TAD I A6.7, 1.7; Quack 2016). The historically most important information is that at some point, the Persians were reduced to being beleaguered, and those who did not make it inside the fortress in time were caught by the rebels.

It is less clear how to evaluate a notice in broken context that Egyptian detachments rebelled, but the Jews of Elephantine did not leave their posts (TAD I A4.5). This is found in a draft for a petition concerning the rebuilding of the Jewish temple of Elephantine after its destruction in 410 BCE, but it stands before the description of the actual events, thus it is likely to be an historical reminiscence (and other drafts of that petition even make mention of the conquest by Cambyses). Unless clear evidence for an Egyptian rebellion after Inaros but before 410 BCE is brought forth, it is most likely that this reminiscence also concerns the Inaros rebellion.

For Darius II, there are no certain contemporary hieroglyphic attestations in Egypt (although it is not impossible that some cases taken to concern Darius I rather refer to him), but he is attested posthumously in the register of the fields of the Edfu temple, where in one passage mention is made of donations up to the year 19 of Darius; and this can only be the final year of Darius II (Vittmann 2011: p. 401). In any case, unpublished demotic ostraca from Manawir (oasis of Kharga) attest his uncontested rule in Egypt.

Shortly after the accession of Artaxerxes II (404 BCE), a new rebellion started in Egypt, led by a Libyan dynast Amyrtaios, who seems also to have taken the name Psammetichus (V). It is possible that he was related to the family of the Saïte kings and/or previous insurgents during the Persian rule, or claimed so. At least in some parts of Egypt (Kharga Oasis and Elephantine), Artaxerxes II was still acknowledged as king until his third/fourth year (401 BCE). A Persian army under the command of Abrocomas, camped in Phoenicia and poised for countermeasures in 401 BCE, never really set out for Egypt because of the inner-Persian conflict between Artaxerxes II and his younger brother Cyrus (see Chapter 32 From Darius II to Darius III).

The last evidence of Persian rule is found in an Aramaic oath from Elephantine (TAD II B7.2) dated to year 4, Paophi 18 of Artaxerxes (January 18, 401 BCE, if this is really Artaxerxes II). Still, the last documents acknowledging the Persian rule hint already at difficulties or even a precarious situation, especially a contract from Elephantine (TAD II B3.13) dated to year 4, month Thot of Artaxerxes II (December 2–31, 402 BCE). It documents that a mercenary borrows grain to be repaid from the rations which were given to him by the royal treasury. It seems as if the Persians were no longer able to assure the provisioning of their soldiers on a regular basis. In his year 5 (June 21, 400 BCE), Amyrtaios was recognized as king even in Elephantine (TAD II B4.6). Tamos, admiral of Cyrus the younger, took the fleet to Egypt after the death of Cyrus, but he was killed there by Psammetichus (V) together with his sons.

The Struggle for Keeping Independence

While Egypt regained independence with the successful rebellion of Amyrtaios, the following decennia were dominated by Persian efforts at recapturing it, with occasional Egyptian counterattacks, both sides strongly relying on Greek mercenaries. Egypt was characterized during this time by rather precarious power structures, with frequent rebellions and internecine fighting. The dynasties were short-lived and there was no direct succession from father to son over more than three generations. Amyrtaios remained the sole king of the twenty-eighth dynasty, and rather soon after the final victory against the Persians, in 399 BCE, he was driven from power by Nephertites from Mendes, the founder of the twenty-ninth dynasty; the change in ruler is mentioned in an Aramaic letter from Elephantine (TAD I A3.9).

The Persians made several substantial efforts to gain back Egypt. A first effort, delayed by dealings in Asia Minor and the Aegean, took place around 385–383 BCE (according to other scholars 390–387 BCE). It failed ultimately, although little is known about the details (Isoc. Paneg. 4.140–141). Egypt (under Hakoris), in league with Cyprus, went into the offensive and for a short time controlled the Levantine coast up to Cilicia. A counter-campaign, led by Tiribazus and Orontes, was victorious on Cyprus around 381/380 BCE, which left Egypt without allies. At that time, the Athenian general Chabrias put up a strong defense system in the eastern Delta.

Under the command of Pharnabazus and Iphicrates, Artaxerxes II sent out a long-prepared expedition in 373 BCE. They succeeded in breaking through the defense lines at the Mendesian branch of the Nile, but ultimately failed, due to the resistance of the Egyptian army (under king Nectanebes I) and especially the rising Nile inundation.

The following period of weakness in Persia (due to the satrap revolt) was used by Egypt to prepare a large military expedition to Syria led by Tachos/Teos, the son of Nectanebes I, in 361/360 BCE. For a moment it seemed successful, but the inner-Egyptian developments finally brought it to naught: Samaus, the uncle of Tachos, who had been left in Egypt for directing its administration, instigated a rebellion and made his son, Nectanebos (II) (who had commanded the indigenous part of the Egyptian army), king. In that, he was helped by Agesilaos of Sparta and his Greek mercenaries. Tachos fled to Persia where he was well received by Artaxerxes II and even appointed as a general in the war against Egypt (but it is not clear whether an army was actually sent out; there are indications that Artaxerxes III, Ochus, at a time when he was still crown prince, made war against Egypt).

A substantial army was led by Artaxerxes III personally against Egypt in the winter of 351/350 BCE. It was driven back by the Egyptians. The recently published beginning of the Apis embalming ritual (Meyrat 2013) indicates that the king Nectanebos II was replaced at the ceremony by his eldest son because he was fighting against the Persian king.

A new effort by Artaxerxes, probably to be situated in 343/342 BCE (contra Depuydt 2010; see Quack 2011a: p. 230), was finally successful, although it had to face serious problems in traversing the Sinai and lost soldiers in the quicksand (Agut-Labordère 2008). Facing Pelusium, the Persian army was split up into three contingents. One of them, led by Egyptian guides, managed to get hold of a “hidden place” on the Nile and defeated a part of the Egyptian army. When news of the loss reached Nectanebos, he left his position and retreated to Memphis. Then, the city garrisons of the Delta surrendered to the Persians, hoping for clemency. Nectanebos II fled to Nubia, taking with him the greater part of his riches (perhaps by negotiations with the Persians and leaving his son, general Tjai-Hapimou, as security).

The Second Persian Rule

The second Persian rule over Egypt (Devauchelle 1995) is designated as the thirty-first dynasty in scholarship. After the recapture, Artaxerxes III had some coins minted with a demotic Egyptian inscription “Artaxerxes the king.” He plundered a lot of gold and silver from the temples and ransomed their records. He is also, like Cambyses, accused of killing the Apis bull.

Several Egyptian biographies of that time speak of trouble (Menu 2008), but none clearly names a ruler. Onnophris, Somtutefnacht, and Tjai-Hapimou all indicate that they had been taken to Asia but could come back to Egypt.

Sometime during this time, there was also a short reign of a king bearing the clearly non-Egyptian name Khaba(ba)sh (Moje 2010). He is attested in a

contract made during his first year at Thebes (by a scribe otherwise documented between 330 and 324 BCE, so his reign should be set shortly before the Macedonian conquest of Egypt), and for his second year in Memphis by an Apis stela. Another, posthumous, document, the satrap stela of the future Ptolemy I, renews a land grant made by him for the temple of Buto in the delta. The wide geographical span makes it likely that Khababash was in control of most or even all of Egypt, although he is not mentioned in any single Greek historian's record. The Satrap stela indicates that he tried to reinforce the river mouths against Asiatic invasions.

Further problems are created by a king Horus, son of Isis, son of Osiris, whose second regnal year is attested in a marriage contract from Qarara in Middle Egypt. Scholarly proposals to see in him a rebel king during the Ptolemaic time (c. 130 BCE) are problematic (Quack 2011b: pp. 123–126), and it is not excluded that this is another short-lived indigenous dynast during the thirty-first dynasty.

After the battle of Issos, Amyntas, a leader of Greek mercenaries who had fought on the Persian side, tried to invade Egypt (333 BCE). The Persians under Mazaces first withdrew to Memphis, and then made a sally, slaying Amyntas and his men. When Alexander the Great arrived in Egypt (332 BCE), Mazaces handed over Egypt to him, ending Persian rule on the Nile for many centuries.

Later Reflections on Persian Rule

Already texts of the thirtieth dynasty refer to damage done by the “foreigners” – probably the Persians (Klotz 2010: pp. 147 and 152–154). The clearest and most reliable testimony on the Persians in later Egyptian texts is a recurrent theme of early Ptolemaic texts that Egyptian statues had been displaced to Asia by the Persians and were brought back by the Ptolemaic kings (Thiers 2007: pp. 100–106).

Specifically the second Persian domination is seen as a time of harsh oppression and manslaughter in a short section of the “Demotic Chronicle” (4.20–5.4). Since the preserved sections say hardly anything about the first Persian occupation, it cannot be judged whether the second one was felt to be more oppressive.

The Prophecy of the Lamb mentions the “Medes” in only one single, highly fragmentary passage of doubtful interpretation. Otherwise, it is more clearly concerned with the Assyrians.

It has been proposed to understand a lament on the desecration and destruction of a temple attested in a Ptolemaic-period hieratic papyrus as alluding to the troubles of the Persian invasion (Burkard 2003); however,

they are never explicitly mentioned in the preserved parts, and other periods of invasion, such as the Hyksos period, are at as least as likely candidates (Quack 2012: p. 30).

There is a demotic tale which probably mentions Cyrus, but mixes up historical motives of the Ethiopian and the Persian rule over Egypt (Quack 2016b: p. 53). Generally, demotic narrative texts purporting to be set in the time of the Assyrians tend to contain some elements of unmistakably Persian derivation like the organization in satrapies. This is a telescoping of the events probably due to the long time-span between the actual events and the preserved manuscripts which mainly date to the Roman imperial period. The Coptic story of Cambyses is an interesting case of very late reflections on the Persian conquest, mixed up with the Neo-Babylonian conquest of Judah by Nebuchadnezzar.

CHAPTER 40

Nubia

Angelika Lohwasser

South of the ancient boundary of Egypt at the first cataract, the region is called Nubia (Figure 40.1). This is the realm of the kings of Kush, who reigned up to the confluence of the Blue and the White Niles. Kush, which was called Aithiopia by the classical authors, is the target of the last and futile attack of the Persian king Cambyses in the *Histories* of Herodotus.

Nubia

Scholars phase the history of the Kingdom of Kush in the Napatan (ninth century to fourth century BCE) and the Meroitic (fourth century BCE to fourth century CE) periods. The heyday of the Napatan kings was their domination over Egypt and Kush during the twenty-fifth dynasty (c. 721–663 BCE). After their retreat, forced by several Assyrian attacks against Egypt, the kings continued to use Egyptian cultural traits beside their indigenous Kushite ones. It is most necessary to stress that up to the beginning of the Meroitic period the Kushites used the Egyptian language and Egyptian hieroglyphs to write official documents, although we know that their own language, Meroitic, was used at least since the Egyptian New Kingdom, where it is attested sporadically in personal names. Thus we have to bear in mind that the historical documents of the Napatan phase of the Kingdom of Kush are written in a foreign script and language (Egyptian) or written by complete foreigners (classical authors). Therefore we have to consider the archeological sources,

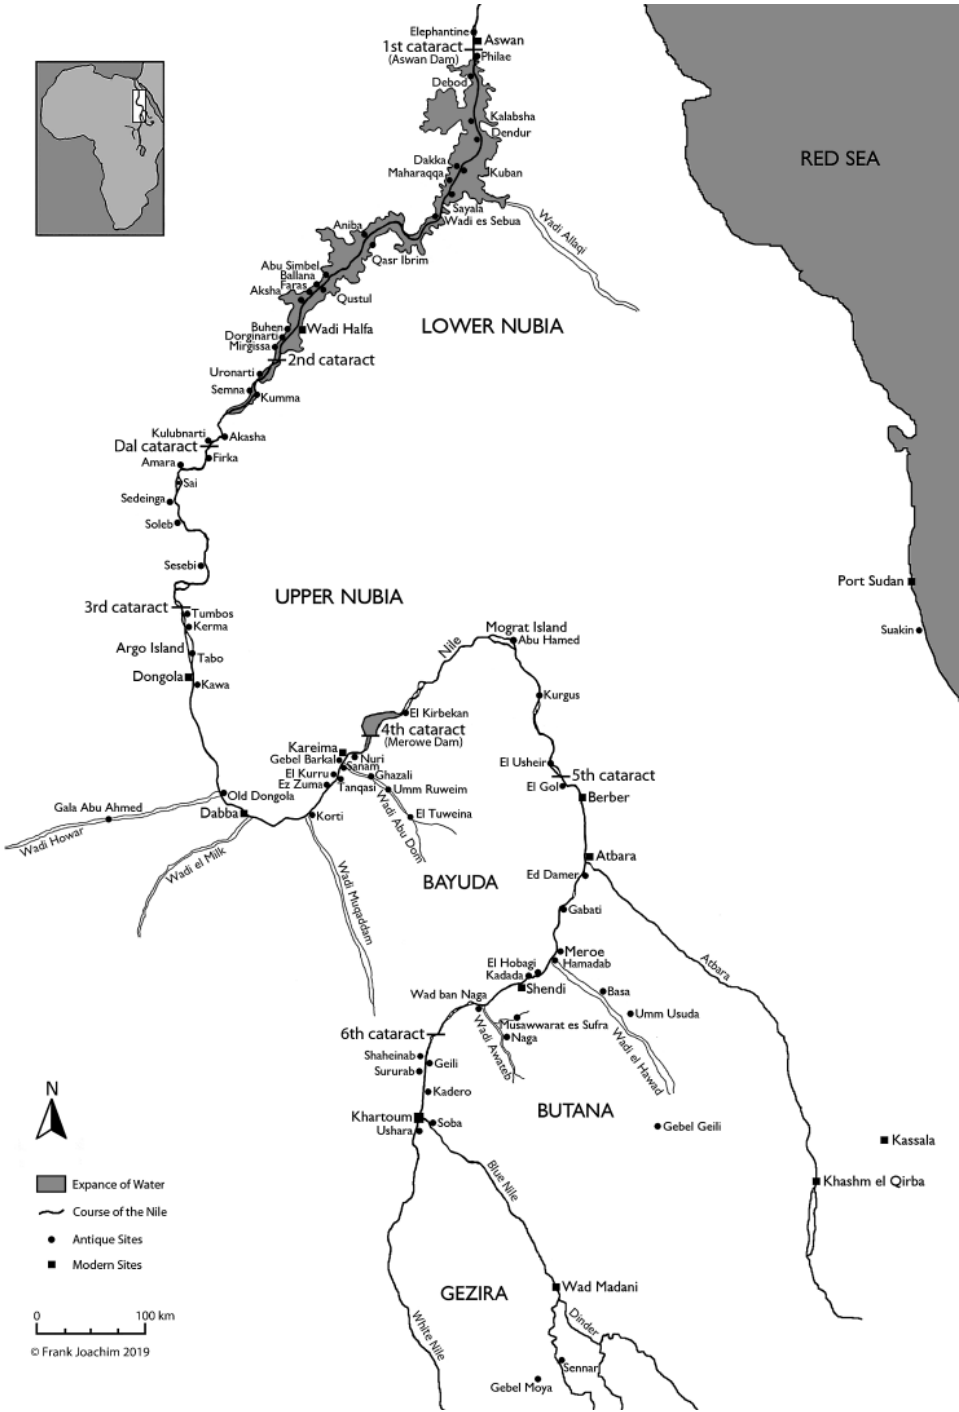

Figure 40.1 Map of Nubia. Source: Reproduced by permission of Frank Joachim.

too, when we compile the evidence for the situation south of Egypt during its Persian occupation.

Archeological and Written Evidence in Nubia 525–330 BCE

Lower Nubia especially between the first and the second cataracts is barren and was only sparsely inhabited in former times. South of Lower Nubia, the landscape of upper and southern Nubia is much more fertile. This is where the heartlands of the Kingdom of Kush were located. During the middle and late Napatan periods, which were contemporary with Achaemenid Persia, the administrative capital of the kingdom was situated in Meroe, whereas the sacral capital remained at the traditional holy area around the Jebel Barkal, at Napata. The kings received their crown in the great Amun temple in front of the Jebel Barkal, and they were buried under the pyramids of Nuri on the opposite bank of the Nile. The cemetery of the administrative elite was already installed at Meroe itself. Our knowledge about the material culture of this time relies mostly on the burials of the royal court, since we lack temples and settlements datable to the period. The only exception up to now is the fort of Dorginarti in Lower Nubia. Several expeditions were sent to Lower Nubia to survey what was to become the basin of Lake Nasser. That is why we can state that Lower Nubia is one of the archeologically best-known regions of the world, but only a part of the results have been intensively studied and published up to now. The datation of the fortress of Dorginarti in the time of the Persian occupation of Egypt was not done until 1992 (Heidorn 1991, 1992), and maybe there will be an increase in sources like this when all the material is studied.

The archeological material revealed in the fortress of Dorginarti hints at a guardian function for trade and diplomatic exchange between Egypt (and beyond) and Kush (also as a corridor to inner Africa) along the Nile (Heidorn 1992: p. 147). Since there are attested several conflicts between the Kushites and Saite Egypt, it is also possible to interpret the fortress as a Saite outpost. This may be a result of the military activity of Psammetik II (595–589 BCE), which led to Egyptian control of Lower Nubia (Török 2009: p. 362). The Kushite reoccupation of this region was accomplished during the revolt of Inaros (463/2–449 BCE), thus in the description of Herodotus (see below) the Kingdom of Kush extends from the first cataract upstream of the Nile (Török 2009: p. 367).

There are several objects of Mediterranean provenience found in the tombs of Nuri and Meroe. The most prominent artifact is the Attic plastic rhyton,

found in pyramid 24 of the southern cemetery of Meroe and inscribed by the potter Sotades. It illustrates – besides an Amazon on horseback – the fighting between Greeks and victorious Persians and can be dated to about 470 BCE. This specimen as well as other Mediterranean products, where only sherds survive, may be interpreted as diplomatic gifts by Persian officials (Török 1989: pp. 69–71 and Appendix).

Apart from the sparse archeological evidence of this time, there are three royal inscriptions casting light on the internal situation as well as some enigmatic interactions with Persian Egypt. Although the inscription of Irike-Amanote (end of the fifth century BCE) on a wall of the temple of Kawa does not mention external affairs, Török (2009: p. 367) states that the titulary of this king declares a claim to the regency of Egypt. Perhaps this king already formulated the political program to expand the realm to the north which was carried out by Harsiotef (first half of the fourth century BCE). The stela of Harsiotef, erected in the court of the great Amun temple at Jebel Barkal, reflects his ascent to the throne, several victorious military undertakings, donations, building activities, and festivals. In the course of one of these battles Harsiotef even reached Syene (Aswan), the southernmost town of Egypt. The buffer zone between Kush and (Persian) Egypt was under Kushite control at that time. The stela of king Nastasen (second half of the fourth century BCE) is perhaps the most interesting one in this context. Like the other great royal stelae of Kush, it starts with his enthronement and covers military activities as well as donations and festivals. In line 39 the text says: “xmbswdn came. (I) had a force of bowmen go from Tshare. Great slaughter. (I) seized all his ..., (I) captured all the transport ships of the chief. ...”¹ The name of the foe xmbswdn was thought to be Cambyses (Schäfer 1901: pp. 45–50), but after the archeologically-based dating of Nastasen to the end of the fourth century BCE by G.A. Reisner (1923: pp. 18, 59, 63), the contemporaneity of this Kushite king with the Persian king Cambyses was dismissed. Hintze (1959: pp. 17–20) interpreted the name as the ephemeral pharaoh Khababash, who was a local ruler in Egypt about 343–337 BCE. Since his realm was in Lower Egypt and the reading of the hieroglyphs for “Khababash” is not without problems, the identification of the foe of Nastasen is still open for discussion.^{2,3}

Interaction Between Nubia and Achaemenid Persia

The most comprehensive classical source on the relationship between Nubia and Persia is the *Histories* of Herodotus of Halikarnassos.⁴ In his third book he describes the conquest of Egypt by Cambyses and his attack on Aithiopia (= Kush). The planned – and failed – war is the leading story for introducing

the Aithiopians in a *logos*. This is the most extensive account of the Aithiopians in antiquity, and it is striking that we lack information on a clash between Persians and Kushites in the archeological record.

The early utopian views of Aithiopia also occur in Herodotus' excursus on that country (3.17–26). But beside mythical allusions he refers to gifts paid to the Persian king (3.97) and the Kushites in the Persian army (7.69). There might have been a real attack by Cambyses against Kush, and at least the people in the buffer zone had to deliver gifts (ebony, gold, and elephant tusks). Perhaps Dorginarti was the collecting point for these "gifts," originating from further south. Kushites are depicted as the last of the tributaries of the empire in the reliefs of the Apadana at Persepolis. In the later years of Darius I, "Kushiya" is included as one of the tributary nations supporting the throne. But since these depictions may be a reflection of the Persian king's adoption of Egyptian kingship ideology, the evidence is not conclusive of Persian domination of Nubia.

Among the foreign contingents in the army of Xerxes also Aithiopians are recorded. Herodotus describes them as very exotic – wearing leopard skins, smearing their bodies half red and half white, and carrying long bows. They are interpreted as people of the southern fringe of the Kushite Empire, but neither the custom of painting the body nor of wearing leopard skins during a battle is attested in indigenous Kushite sources.

The costume of the Kushites depicted on the Persian monuments differs considerably from the iconography we know from Kushite reliefs. Yet there exist Achaemenid but Egyptianizing ivories – one of them depicting a Kushite – which were made using Kushite ivory. Perhaps ivory as a material was imported or presented as a (diplomatic) gift, but the Achaemenid artist never saw a Kushite with his own eyes.

Conclusion

Since we know very little about the late Napatan period in Kush, we can only hypothesize about any connection with Achaemenid Persia. It is conceivable that in the course of overrunning Egypt, Cambyses invaded Lower Nubia, too. The fort of Dorginarti may be the most southern outpost of the Saite Empire at the beginning, but also of the Persian Empire. It may well have served as the collecting point of (trading) goods from Kush. Several finds from the Mediterranean in Kush, as well as the use of Kushite ivory in the Achaemenid artwork and the notes of Herodotus on Kushite "gifts" for the Persian court, let us suggest at least diplomatic gift exchange, if not trade in exotic materials. Even before the withdrawal of the Persian dynasty from Egypt in 404 BCE, Lower Nubia was again under Kushite control, as we learn

from the inscriptions of Harsiotef and Nastasen. There is no indication that the Persians invaded Lower Nubia again in their second reign over Egypt (third dynasty, 342–332 BCE).

CHAPTER 41

The Cyrenaica

André Heller

Introductory Remarks

Cyrenaica or Cyrenaea stretched from Arae Philaenorum (modern Ras al-A'ali) in the west, where Carthaginian territory began, to Catabathmus megas (modern Solum) in the east (Figure 41.1). The name is anachronistic as Greeks and Persians called the area Libyē and Pūtu, respectively. Libyē could especially describe Cyrenaica, but the Greeks also used it for the entire African continent except Egypt. Putāya (“Libyans”), meanwhile, probably deriving from Egyptian Pwd>Pjyt (Posener 1936: p. 186; Osing 1980: p. 1016), is attested only three times in Persian inscriptions. Besides Cyrene, the other Greek cities were Barca (modern El Merj), Euhesperides (modern Benghazi, founded c. 575 BCE), Taucheira (modern Tobra, founded c. 625 BCE), and Cyrene’s harbor Apollonia (modern Susah). These five major cities later became known as Pentapolis.

The main source for Cyrenaica under Persian rule is Herodotus, who might have visited Cyrene. He devotes a quarter of the fourth book of his *Histories* to the city’s foundation, to its later history down to 513 BCE (4.150–167. 200–205), and to the Libyan tribes living west of Egypt (4.168–199). Unfortunately, relations between Cyrene and Persia are only the background of his proper theme, namely queen Pheretima’s revenge on the Barcians and her fate (Gianguilio 2011). Her deeds are also commemorated in the anonymous “Treatise on women” (Gera 1997: pp. 164–178, 212–213).

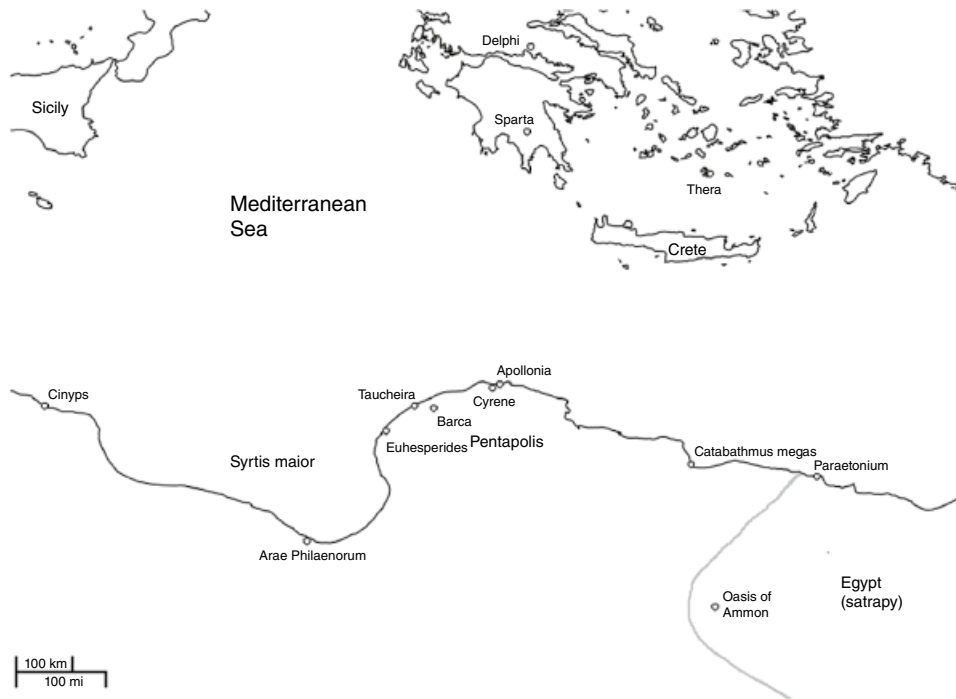

Figure 41.1 Map of Cyrenaica; the map was created by using AWMc: À-la-carte MAP (<http://awmc.unc.edu/awmc/applications/alacarte>).

The earliest testimonies on Cyrene are Pindarus' Pythian Odes with their scholia. Scattered evidence derives from Thucydides and Diodorus Siculus, among others. In the late second century BCE, Menecles of Barca wrote *Libyka* ("Libyan histories"), of which only two fragments are extant.

Modern handbooks and essays on the Persian Empire dedicate only short remarks on Cyrenaica. The best account on Cyrene and Persia and the chronology of the reign of Arcesilaus III are Mitchell's articles (1966 and 1974). Archeological excavations add little to our knowledge.

Cyrenaica Before the Persian Conquest

Colonists from Thera under Battus' leadership founded Cyrene in 631 BCE (Austin 2008); kings from the Battiad line ruled Cyrene for eight generations (Herodotus 4.163.2). Some 50 years after the foundation, Battus II attracted new settlers from the Peloponnese and the Aegean Islands with the help of the Delphic oracle. The need for land brought Cyrene into conflict with the neighboring Libyans, whose king, Adicran, allied with Egypt. The Cyrenians defeated the united troops at Irasa; hence, general Amasis expelled pharaoh

Apries, who took refuge with the Babylonian king Nebuchadnezzar II. The attempt to reclaim his throne with Babylonian help failed in 567 BCE and Apries was killed (Leahy 1988). Troops from Cyrene (Pūtu-Yaman “Greeks of Libya”) fought on Amasis’ side, as Edel (1979) has convincingly demonstrated. Around 560 BCE, Arcesilaus II’s harshness resulted in civil strife; inhabitants of Cyrene emigrated to the Libyan settlement Barca under the king’s brothers (Herodotus 4.160.1). In the war between Cyrene and the Libyan-Barcian coalition, Arcesilaus lost nearly 7000 hoplites (a number barely credible) and was murdered not long afterwards. Under his successor, Battus III, rivalries broke out between old and newly arrived settlers. Demonax of Mantinea settled differences by restricting the royal power to the religious sphere and transferring the other privileges to the people (Hölkeskamp 1993). Battus also formed an alliance with Amasis, who married Battus’ daughter, Ladice (Herodotus 2.181).

Persian Rule Over the Cyrenaica

When Cambyses conquered Egypt in 525 BCE, Cyrene and Barca as well as the neighboring Libyans surrendered without fight and sent tribute (Herodotus 3.13.3–4; Diodorus Siculus 10.15). Although Cambyses was displeased by the 500 minas of silver offered by Arcesilaus III, he sent Ladice, the widow of the meanwhile deceased Amasis, back to Cyrene. Cambyses’ anger is probably Herodotus’ invention to acquit Cyrene of medism. Besides this date, Herodotus gives no chronological hint for Arcesilaus’ reign. Backed by Persian support, Arcesilaus reclaimed the old royal rights, but met fierce opposition and was forced to flee to Samos. Arcesilaus’ mother, Pheretima, went to the Cypriote king, Euelthon of Salamis. A scarab from Cyrene with her name in Cypriot syllabic script depicting the Egyptian god Bes confirms this episode (Wright 2007b). Flight and choice of refuges suggest connection between Arcesilaus’ failure and Egypt’s rebellion from Persia. In 518 BCE, Darius reconquered Egypt and reinstated Aryandes as satrap (Cameron 1943: pp. 309–312). While Pheretima unsuccessfully appealed for an army, her son gathered enough Samians to win back his throne. Some historians (e.g. Noshay 1968) put these events before 525 BCE, but this causes serious chronological and historical problems, as Mitchell (1966: pp. 99–103; 1974) has shown. After his return, Arcesilaus killed or expelled his opponents, but then retired to Barca to his father-in-law, Alazeir, leaving his mother in charge. There exiled Cyrenians together with king Alazeir assassinated him. His mother could not maintain Cyrene and fled to Aryandes. The motif of the murder must be liberation from Battiad rule and Persian yoke. Aryandes reacted quickly and dispatched the Egyptian army and fleet (Högemann 1992:

pp. 314–317) to quell rebellion and restore Battiad rule. Pheretima's vengeance played, if at all, only a minor role in his decision. Herodotus (4.145.1) synchronizes the Libyan expedition with Megabazus' operations on the Hellespont (514/3 BCE). The picture of the Libyan expedition that emerges from Herodotus is difficult to reconcile with the other sources. Barca was captured by treachery after a nine-month siege and the Barcians were deported to Bactria. The deportation is ahistorical (De Sanctis 1931) and in fact inspired by Barciani, who are identical with the Hyrcanians (Schmitt 1979: pp. 129–131). Aeneas Tacticus (37.6–7), who wrote around 360 BCE, also names Barca, while later sources like Menecles substitute Cyrene instead. Although Herodotus seems to know of a Persian attack on Cyrene, the story shows bias by a Cyrenian source. In 1966, archeologists discovered many mutilated statues buried in a favissa outside the city walls of ancient Cyrene (Goodchild et al. 1966). Either the Persians destroyed the extramural sanctuary of Zeus to put pressure on Cyrene or they used the statues for the construction of a siege mound, as Wright (2007a) supposed by comparing analogous findings from Cyprus. Euhesperides was the westernmost point the expedition reached. Herodotus' narrative ends with Pheretima's horrible death in Egypt; he says not a word on the Persians' settlement concerning Cyrene. From Polyaeus (8.47), however, we can conclude that from 513 BCE Battus IV ruled Cyrene. The expedition was successful, as Libyans are listed as subject peoples in Darius' inscriptions after 513 BCE (Cameron 1943: pp. 307–309). According to Herodotus (3.91.2), Libyans, Cyrene, and Barca belonged to the sixth *nomos* (Egypt) and paid an annual tribute of 700 talents, but did not have the status of a satrapy, although some historians claim so (Jacobs 1994: p. 173).

At the same time, Dorieus of Sparta tried to settle the fertile territory around the river Cinyrs (modern Oued Ca'am), but was expelled by Carthaginians and Libyans (Herodotus 5.42); the venture was supported by Thera but not officially by Cyrene. Probably at the beginning of Xerxes' reign, Barca refused to pay tribute and was again captured by stratagem (Polyaeus 7.28.1). Cyrene is not among those states the Greeks sent messengers to on the eve of the Persian invasion (Herodotus 7.145.2). Herodotus (7.71, 86.2, and 184.4) mentions Libyans as part of the Persians' levy, but neither Cyrenians nor Barcians.

After the Persian defeats at Salamis and Plataeae (480/79), ties between Greece and Cyrene grew stronger. Pausanias (6.19.10) attests a treasury of the "Libyans in Cyrene" in Delphi. In 474 BCE, Telesicrates of Cyrene won the hoplite race in Delphi (Pindarus, Pythian Ode 9), 462 BCE Arcesilaus IV triumphed in the chariot race there, and two years later at the Olympic Games (Pythian Odes 4 and 5 with their scholia). Participation in the Panhellenic games, however, is no proof for growing distance to Persia. More importantly, Pindarus' odes reflect the internal problems of the king, as he emphasizes the

mythological legitimization of the Battiad house. Arcesilaus IV augmented Euhesperides with additional settlers, perhaps as refuge for him. Only a few years later, Arcesilaus and his son, Battus, were killed. Thereafter, aristocrats who maintained friendly relations with Sparta ruled Cyrene. Following a merciless civil war, Cyrene became a democracy after 402/1 BCE. It is tempting to connect Arcesilaus' internal problems with Persian weakness, shown by the destruction of their fleet at Eurymedon and the revolt of Egypt (463–457 BCE, according to Kahn 2008) under the Bacalian (a tribe living between Euhesperides and Barca) prince Inarus (Winnicki 2006). After their defeat, the rest of the Athenian expedition force escaped to Cyrene and sailed home (Thucydides 1.104. 109–110; Diodorus Siculus 10.77.2–5). It is possible to connect the Athenians' arrival with the overthrow of the monarchy; however, without evidence in the sources, this is highly conjectural. In any case, it might be concluded with some confidence that the Battiads' overthrow brought to an end the Persian hegemony over Cyrenaica. Beyond that, the Persians lost control over Egypt several times in the following decades. As a result, the continuity of Persian influence on Cyrene and Barca is very doubtful.

When in 332 BCE Alexander the Great marched via the coastal road to Paraetionium (modern Marsa Matrouh) on his way to Siwah, Cyrenian envoys came to meet him, presenting him with magnificent gifts. This resulted in friendship and treaty with the king (Arrian, *Anabasis* 3.3.3; Curtius Rufus 4.7.9; Diodorus Siculus 17.49.2), which secured Cyrene's independency.

Cyrene and Barca were renowned for their horses and chariots; their main export good was the famous silphion plant (Amigues 2004), which is depicted on coins. Under Battus IV the temple of Zeus Ammon was built. It was probably this equation with Zeus Lycaeus that helped to increase Ammon's popularity in Greece (Austin 2008: pp. 213–214). Cyrene's economic power is reflected by the total of 805 000 medimni of grain, sent to different Greek states to relieve famine after 330 BCE (Tod 1948: no. 196).

CHAPTER 42

The Levant

Oskar Kaelin

The Levant and the Persian Empire

Asymmetries in information make a balanced reconstruction of Levantine history in Persian time difficult (cf. Elayi 2008 on Byblos and Sidon). Archeology has only lately shown a real interest, and is hampered by illicit diggings, forgeries, or still unpublished results of important excavations (Grabbe 2004: pp. 54–69). The available historical texts seem eloquent, but focus, sometimes tendentiously, on their respective interests. Classical texts note the Persian actions in the Mediterranean and along the Levantine coast, but usually ignore the landlocked regions (Grabbe 2004: pp. 16–20, 118–131). Old Testament texts are concerned with the problems ensuing by the return of the descendants of the former elite from Babylonian exile to Judah, the rebuilding of Jerusalem as a regional center, and the reshaping of political and religious structures. As an ideological support, narratives were created, compiled, edited – with further impact on biblical and cultural history. But as there is no confirmation outside the Bible, their interpretation is debated (Keel 2007: §§ 1261–1570; Liverani 2005: pp. 250–368; Grabbe 2004: pp. 2, 70–106, 269–346; Eph'al 1998: pp. 106–110).

Chronologies are far from clear, even when backed by archeology and epigraphy. Many kings are known from coins, but only by an initial letter, which cannot always be matched self-evidently to names from other sources (e.g. Elayi 2006: pp. 18–19, 23). Even for Sidon, the best-documented site, the

available information only allows us to reconstruct a plausible, but only probable, sequence of events (e.g. Jacobs 2006; Stucky 2005: p. 23).

People of the Levant

The Lebanon mountain range and its extensions divide the Levant into two main regions: the coast and the landlocked regions. Though part of one satrapy, the people and regions had different cultural backgrounds and political interests. By migration, trade, or forced deportations (see Chapter 61 Deportations) the population of the different regions, organized as city-states or nomadic tribes, had grown multiethnic, multilingual, and multicultural. The coast cities were melting pots with people from Syria, Asia Minor, Cyprus, Greece, Egypt, northern Africa. In the landlocked regions, names in the Aramaic ostraca from Beer-Sheba and Tell Arad (fourth century BCE) are Arabic, Edomite, common Semitic, and Hebrew (Grabbe 2004: p. 59); in the texts of Wadi ed-Daliyeh (c. 375–335 BCE), mostly Hebrew, but also Persian, Aramaic, Phoenician, Edomite, and Akkadian (Grabbe 2004: p. 56; Eph'al 1988: pp. 148–149).

Demonyms as Aramaens, Hebrews, Palestinian, Arabs, Ashdodites, Ammonites, Moabites, and Phoenicians may be based on ethnics, languages, or local provenance. The designation for one important “group” – the “Phoenicians” – is coined by the Greeks and purely etic. They acted primarily as individual city-states (e.g. Sidon, Tyre). So-called “Phoenicians,” whether defined by language or by provenance, lived along the Levantine coast, but their diaspora and cultural impact extended to Asia Minor, Egypt (Hdt. 2.112), Greece (Hdt. 8.85), Arabia, north Africa (e.g. Carthage, Hdt. 3.19; Libya, Hdt. 2.32), and southern Europe (Akkermans and Schwartz 2003: pp. 386–387).

Competitors and Allies

The Persian expansion menaced Egyptian, Greek, and Cypriote interests in the Levant. So, almost each Persian king had to deal with them – usually with Phoenician support. Cambyses II fought an alliance of Egypt and Samos (Kuhrt 2010: pp. 104–106; Grabbe 2004: pp. 267–268). Xerxes put down revolts in Egypt, and campaigned against Greece (Grabbe 2004: pp. 290–291; Briant 2002: pp. 197, 489). Artaxerxes I confronted revolts in Egypt supported by Athens. The Persian general Megabyzus suppressed the revolt, but later, as a satrap of Trans-Euphrates, he rebelled against the Persian king (according to Ctesias, but see Grabbe 2004: p. 291). Under Artaxerxes II

Egypt revolted anew, and the Greek cities were troublesome. When Evagoras of Salamis (410–374 BCE) expanded his rule to the Levantine coast, Tyre, the Arabs, and Egypt supported him. After these events, Egypt, supported by Sparta and Athens, once more started war. Pharaoh Tachos set camp in Phoenicia (359 BCE), and sent his nephew Nectanebo (II) to lay siege to Syrian cities; but a coup allowed Nectanebo to seize power in Egypt and he returned (Kuhrt 2010: pp. 349–352; Grabbe 2004: pp. 322–323; Briant 2002: p. 994; Eph'al 1988: pp. 145–146).

When Artaxerxes' III first attempts to recapture Egypt failed (c. 351 BCE), upheavals broke out along the Levantine coast. Isocrates – in a letter to Philipp of Macedonia (347 BCE) – hyped these riots into a major revolt in which the Persian king had lost all the ships of Cyprus, Phoenicia, and Cilicia. But the revolt in Sidon was brutally suppressed. With the Levant pacified, Artaxerxes III marched against Egypt (343–342 BCE).

The Levant in the Satrapy “Trans-Euphrates”

When the Persians took over the Neo-Babylonian Empire, the Levant became part of the satrapy “Trans-Euphrates” (from the Akkadian *ebir nāri*, “Beyond-the-River”). Further designations for (parts of) the region were Old Persian *Aθuriya* and Elamite *Aš-šu-ra-ap* “Assyria”; the classical sources speak of “Syria,” “Coele-Syria,” or “Syria and Phoenicia” (Eph'al 1988: pp. 139–140).

At first (535–486 BCE), one satrap (^{lú}*pīhātu*/*bēl pīhāti*) controlled “Babylonia and Beyond the River.” Toward the end of Darius' reign, Babylonia and Trans-Euphrates were split into two satrapies (Briant 2002: pp. 487–490; Heltzer 1992; Eph'al 1988: pp. 153–156). Looking from Greece eastward, Herodotus counted Trans-Euphrates as the fifth satrapy; it extended from the Cilician/Syrian border to the borders of Egypt; it included Phoenicia, Palestine, and Cyprus, but no Arabian territories. Its tribute amounted to 350 talents (Hdt. 3.91; Kuhrt 2010: p. 674; Rainey 2001).

After the revolt of Sidon, Artaxerxes III put Mazday, satrap of Cilicia, in charge of Trans-Euphrates. Sidon and Samaria minted coins with his name (Elayi 2006: pp. 20–21).

It is not clear whether the satraps of Trans-Euphrates had only one main residence or several at a time, and whether these were the same over the whole time of Persian rule. Based on different sources and arguments, Sidon, Damascus, Aleppo, and Tripolis are among the candidates (Graf 1993: pp. 153–154; Elayi 1991: pp. 82–83).

Little is known about how the Persian Empire administered the various Levantine regions. Most administration was left to the local rulers and their

elites, controlled by Persian officials and garrisons (as in the Phoenician cities). Accordingly, Persian impact seems rather moderate (Elayi 1991).

In the landlocked regions (e.g. Judah, Samaria) the satrapy was sub-divided into provinces (Aramaic/Hebrew *m'dīnāh*) controlled by a “governor” (west Semitic *peḥāh*) (Eph'al 1988: pp. 158–161).

Cyprus, with its several kingdoms ruled by Phoenician- or Greek-rooted dynasties, was also administered via this satrapy (see Chapter 44 Cyprus and the Mediterranean; Maier 1994: pp. 299–302).

The Phoenician City-States

The Phoenician city-states enjoyed some autonomy as long as they were loyal and provided what the empire needed: (i) experience in shipbuilding and seafaring, fundamental for Persian control of the eastern Mediterranean; (ii) access to the Mediterranean network with colonies and trade posts. Their strategic importance in war and trade attracted the interest of all ambitious powers. But their network and diaspora were too volatile to control without their consent (Briant 2002: pp. 489–506; Maier 1994: pp. 317–326; Eph'al 1988: pp. 156–157).

Phoenician territories were scattered along the coast. The Persian king entrusted Ešmunazer II of Sidon with the cities of Dor and Joppe, and the plain of Sharon with its wheat, in the south of Tyre. Further south, Ashkelon and part of the Philistine coast were again under Tyre. Arwad controlled the regions along the northern part of the coast up to Simyra (Tsirkin 2007: p. 120; Maier 1994: p. 321).

The Persians privileged and strengthened Sidon against its regional neighbors and as a beachhead against Greece and Egypt. Probably already under Cambyses II, Ešmunazer II of Sidon performed great deeds that earned him new territories (Kuhrt 2010: pp. 663–665; cf. Jacobs 2006: p. 142; Stucky 2005: pp. 23–24; different Katzenstein 1989: p. 76). The inscription on his sarcophagus acknowledges control of the “Lord of the Kings” (i.e. the Persian king); but Ešmunazer demonstrates independence, choosing an Egyptian sarcophagus type, Phoenician script, and lauding his deeds and his ancestors (Kuhrt 2010: pp. 663–665; Briant 2002: pp. 489–490).

The privileges ended when Tennes of Sidon revolted, allegedly because of arrogant behavior of the Persian satrap. Persian facilities such as the royal park and the fodder stores were attacked, the satrap arrested. Tennes instigated other cities and sought support of pharaoh Nectanebo. Sidon's wealth allowed fast preparations to be made for war (Diod. Sic. 16.40–42; Kuhrt 2010: p. 409; Grabbe 2004: pp. 346–349; Briant 2002: pp. 682–685; Eph'al 1988: pp. 145–146).

But Artaxerxes III acted as was to be expected: He summoned an army and marched against the rebels. The governors Belesys of Syria and Mazday of

Cilicia supported him, but Tennes, who was backed by Greek mercenaries sent by the Egyptian king, beat them. However, when he realized the size of the Persian army approaching, he arranged to hand over Sidon to the Persians and to help against Egypt. Nevertheless, Artaxerxes III set an example: He had leading Sidonians executed and the city burned down, resulting in about 40 000 peoples dying. Sidon was famed to be so rich that the Persian king sold claims to dig up melted gold and silver. Other cities surrendered (Diod. Sic. 16.42–45; Kuhrt 2010: pp. 409–411). By October 345 BCE, Sidonian prisoners of war arrived in Babylon and Susa (ABC 9, 114; Kuhrt 2010: pp. 412–413; Grayson 1975: p. 114). Afterward, Straton II ruled in Sidon (coins from 342 to 341 BCE), remaining loyal to the Persian king until his death in the battle of Issos (333 BCE) (Briant 2002: p. 713).

Although the Persians' preferential treatment of Sidon placed the other Phoenician cities in a subordinate role, they were active, too. Tyre was the mother city of Carthage and key to accessing the respective network (Elayi 1981). The Tyrians volunteered to support Cambyses II against Egypt, and were spared of force and a campaign against Carthage (Hdt. 3.19; Kuhrt 2010: p. 112). Then again, Tyre supported Evagoras of Salamis when he expanded his rule to the Levantine coast. But when Alexander came, Tyre was the city offering most resistance (Diod. Sic. 17.40.2–3, 46.3–4; Kuhrt 2010: pp. 440–441). Maybe, after the ravage of Sidon, they had stepped up in the favors of the Persian king.

From the third millennium Byblos had been Egypt's most important Levantine partner, but it had lost some prominence since the Neo-Assyrian period. As trade and politics concentrated in Sidon and Tyre, Egypt, too, preferred them as main contacts. Byblos gained new importance as a religious center. By the end of the Persian period it had invested in naval power, taking part in Persian action (Elayi 2008: pp. 100–114).

Close by the sea, wealthy Gaza was a starting point of the desert roads to Egypt (see Chapter 39 Egypt and Chapter 38 The Arabian World). It seems to have been under direct Persian control as no local rulers are known (Katzenstein 1989: pp. 68–70). Gaza had supported the rebellions of Amyrtaeus of Egypt (410 BCE) and of Evagoras of Cyprus (382 BCE), but by the end of Artaxerxes III's Egyptian campaign the region was back under Persian control (Grabbe 2004: pp. 346–349). It resisted Alexander until the end (332/331 BCE, Arr. Anab. 2.25–26).

The Landlocked Provinces

Information on the landlocked provinces is scarce as they were beyond the area of interest of the classical and, to a great extent, the biblical sources. The hinterland was more rural, with some important centers along the main roads that connected the coast and Arabia to the core of the Persian Empire.

An important crossroad was the region in northwestern Syria, where the Euphrates comes closest to the Mediterranean. The palace and paradeisos of the “Syrian” satrap Belesys were situated near the source of the Dardas (mod. Nahr el-Dahab?; Xen. Anab. 1.4.10; Kuhrt 2010: pp. 615–616). The queen mother Paryatis had villages near Aleppo (Xen. Anab. 1.4.9; Kuhrt 2010: p. 821). Another paradeisos was situated at Triparadeisos near the sources of the Orontes; some major buildings were excavated in Tall Mardikh (Briant 2002: p. 1030; Graf 1993: pp. 152–154).

Strabon (XVI 2.20) described Damascus as “the most famous of the cities in that part of the world in the time of the Persian empire” (Eph’al 1988: p. 154). Under Darius I, a pīhātu of Trans-Euphrates is located there. The “prefect” of the city wanted to hand over to Alexander property and money of the Persian king (Curt. 3.12–13; Kuhrt 2010: p. 438).

Some cities of Palestine and Trans-Jordan were strengthened, probably as a buffer against Egypt and Arabia. Aramaic legal papyri found in a cave near Wadi ed-Daliyeh date from Artaxerxes II to Artaxerxes IV/Darius III. Here, the toponym Samaria designates the qryt “city,” the byrt’ “citadel,” and the medinah “province.” A peha “governor,” assisted by a sangu “prefect,” controlled it. Most of the documents are deeds of slave sales and pledges, sometimes witnessed by a governor. The coins issued in Samaria and the sealings assumed to come from Wadi ed-Daliyeh show usually Persian motives but also Greek imagery, partly mediated via Phoenicia (Grabbe 2004: pp. 30–31, 55–58; Briant 2002: pp. 713–716).

The Persian Empire was certainly an important period for the (re-) formation of Judah/Jerusalem. But the small province, rural with small towns and villages, played no important role. Jerusalem was the only large settlement. Inscriptions on some Yehud sealings give the names of several pehā “governors” (Grabbe 2004: pp. 22–34; Briant 2002: pp. 487–488, 504).

Cyrus sanctioned the return of the Jews to Palestine and their rebuilding work in Jerusalem (Ezra 6.2–5; Kuhrt 2010: pp. 84–85). Accordingly, Judah welcomed his rule (Isaiah 41; Kuhrt 2010: pp. 82–84), though it is unclear whether it had already become a Persian province (Grabbe 2004: pp. 265–267; Briant 2002: pp. 45–48; Eph’al 1988: p. 142). Allegedly, the temple of Jerusalem was completed under Darius (but see Grabbe 2004: pp. 282–285; Eph’al 1988: p. 143).

Under Darius II a letter on a papyrus from Elephantine (Egypt) was addressed to Bagohi, governor of Judah: Egyptians had attacked the Yahu temple of the local Jewish community. But pleas for support sent to the Great King, to priests of Jerusalem, and to notables of Judah had remained unanswered (Kuhrt 2010: pp. 856–859; Grabbe 2004: pp. 291–292).

During Artaxerxes III’s conflicts with Egypt all seems to have remained steady in Judah and Samaria (Grabbe 2004: pp. 346–349).

Some of the Aramaic ostraca from the region of ancient Idumea (late fifth and fourth centuries BCE) were excavated (e.g. Beersheba, Tell Arad), but most are without provenance. They include lists of supplies (orders or receipts) of wheat, barley, flour, wine, oil, olives, straw, wood. Unfortunately, it is not clear what administrative units (way stations, post, military, taxes?) issued them (Grabbe 2004: pp. 58–60; Briant 2002: pp. 716–718).

Trade and Products

Various partners were important in Levantine economic life: traditional ones such as Egypt (e.g. in royal burials or sarcophagi), new ones such as the Greeks (e.g. luxury products and painted pottery; see Chapter 18 Syria), and of course the Persian Empire, which generated the biggest consumption and demand.

Apart from ships and maritime force we know little of what the Levant contributed to the Persian Empire. Before the conquest of Babylon by Cyrus, several products reached Mesopotamia via/from the Levant: copper (Yamana/Cyprus?), iron (Lebanon), alum and “Egyptian blue” (Egypt). Other Levantine exports were textiles, honey, wine, and spices. In Persian time Egypt imported wine, metals, and wood from Phoenicia (Briant 2002: pp. 386–387). A document from the time of Darius registers the tithe in purple wools of a governor of Byblos (name debated; Dandamayev 1995).

Sidon prospered, being the Persians’ favorite beachhead to the Mediterranean. Athens issued an honorary decree (360 BCE) for Straton of Sidon for his taking good care of the Athenian envoy to the Great King; it came with tax exemptions for Sidonians. A competition in the luxuries of their tables was held between Straton of Sidon and Nikokles of Paphos (Briant 2002: p. 202).

The Phoenicians were middlemen in the frankincense and casia trade between Arabia and Hellas (Hdt. 3.107; 111). Gaza was another important trade knot in the trade from south Arabia. In return, among others, women were traded to Arabia (Katzenstein 1989: pp. 77–80).

The Persian satraps, the Phoenician cities, but also Gaza, Ashdod, Judah, and Samaria minted their own coins. This was a sign of autonomy, a privilege granted by the Persian king, but foremost a modern economic asset needed in the trade with the Greek world (Elayi 2008: p. 111; Eph’al 1998: pp. 111–113, 1988: pp. 156–158).

The Levantine Contributions to the Persian Army

The Phoenicians were the main suppliers to Persian maritime power. Under Cambyses II a Tyrian fleet volunteered to support the campaign against Egypt (Hdt. 3.19; Kuhrt 2010: p. 112).

To gather intelligence, Darius ordered an expedition of Persian notables on three ships (two warships, one merchantman) starting from Sidon to chart the Greek coasts. The mission reached Tarentum (Italy), where they were arrested as spies and held captive (Hdt. 3.135–138). Phoenician ships supported Darius against Salamis during the Ionian revolt (Hdt. 5.108).

With 300 vessels, Syria, Palestine, and Phoenicia furnished the highest quota to Xerxes' naval force (Hdt. 7.89; Kuhrt 2010: p. 525). Xerxes had a preference for Phoenician ships (Hdt. 8.118). In Salamis many ships were lost in battle (Hdt. 8.85). They were also used to form floating bridges (Hdt. 8.97). Phoenician ships, especially the Sidonian, were prominent in Xerxes' reviews of troops from all the lands of the empire, by which he demonstrated the vastness of the Persian Empire (Briant 2002: pp. 196–198). In Abydos (before crossing the Hellespont), the "Phoenicians from Sidon" won a boat race (Hdt. 7.44). In Doriskos (Thrace), Xerxes paced the land troops in a chariot, boarded a Sidonian vessel, and, under a golden tent, surveyed the ships of all nations (Hdt. 7.100). Before the naval battle of Salamis, Xerxes asked the opinions of kings of Sidon and Tyre (Hdt. 7.98), valuing their maritime experience. The Sidonian king commanded all the Phoenician vessels (Diod. Sic. 14.79.8; Kuhrt 2010: p. 371), but it was always a Persian holding overall command of the fleet (Briant 2002: pp. 197, 489–490).

After raids by Spartans and others in his provinces, the satrap Pharnabazus convinced Artaxerxes II to build a better navy. Conon, an Athenian exile, was given the task and appointed Persian admiral. Cypriot princes built the warships. Phoenician ports were fitted with a fleet, partly under order of the prince of Sidon. The Syracusan Herodas observed the building of the fleet and reported it to the Spartans (Xen. Hell. 3.4.1; Kuhrt 2010: p. 370). Sparta asked Egypt for support, but the shipment was intercepted in Rhodes (Diod. Sic. 14.79.4–8; Kuhrt 2010: pp. 370–371). The new Achaemenid fleet scared Sparta and other Greek cities into peace negotiations, isolating Egypt.

Being part of the Persian Empire had also demographic impact on the Levant. In the battle of Salamis, about 75% of the Persian fleet was destroyed. Tsirkin (2007: pp. 114–115) estimates that about 60 000 men manned the Phoenician fleet, suffering proportional losses.

Change of Rule

The various Levantine regions reacted differently to Alexander's advance against Darius III, reflecting their personal anticipation of their position under Macedonian rule. Differences arose not only between regions but between rulers, families, elites, and people. When the Persian governor of Damascus wanted to surrender the treasures of the Persian king to Alexander (333/332 BCE), he was killed by one of his own men and his head was sent to Darius (Curt. 3.12.27–13.4, 13.17; Kuhrt 2010: pp. 438–439).

Alexander appointed Menon, son of Cerdimmas, as satrap of Coele Syria and gave him cavalry to defend the land (332 BCE). In Phoenicia, Straton crowned Alexander with a gold crown and handed him over Arwad and other cities, while his father, Gerostratus, the king of Arwad and surroundings, was at sea with other Phoenician and Cypriot rulers supporting the Persian general Autophradates. Byblos and Sidon surrendered, the latter because “they detested the Persians” (Arr. Anab. 2.13.7–8; Kuhrt 2010: p. 439). Then, Gerostratus of Arwad and Enylis of Byblos left Autophradates and with about 80 ships defected to Alexander; others (e.g. Rhodes, Lycia, Cyprus) followed (Arr. Anab. 2.20.1–3; Kuhrt 2010: pp. 442–443).

The city of Tyre, too, surrendered, while its king was at sea. Although Alexander had initially been allowed to enter the city and to sacrifice there to Heracles (Arr. Anab. 2.15.6; Kuhrt 2010: pp. 439–440), the Tyrians changed their minds and forced him to besiege them. They trusted in the strength of their island city, and in the support from Carthago and Darius (Diod. Sic. 17.40.2–3, 46.3–4; Kuhrt 2010: pp. 440–441).

On the way to Egypt Alexander took resistant Gaza. While in Egypt, the people of Samaria burned alive Andromachus, whom Alexander had put in charge of Syria (331 BCE). He appointed a new governor and punished the perpetrators (Curt. 4.8.9–11; Kuhrt 2010: p. 445).

The cities embracing the new “Great King” Alexander certainly hoped for improvement. It is understandable that Sidon changed partner after its harsh treatment by Artaxerxes III. But Tyre, which once had supported Cyprus and Egypt against the Persians, fought hard to stay independent from Alexander. Maybe, after Sidon’s fall from grace, and being the mother city and partner of Carthage, it wanted to keep its position as an independent broker between Carthage, the Mediterranean network, and the vast but navy-less Persian Empire. Being the main provider of naval power and experience was an asset to the otherwise landlocked Persian Empire, and leverage to maintain some independence. But in Alexander’s empire there was plenty of maritime experience available, and for centuries Ionian cities had been the competitors of the Phoenicians. Consequently, the Phoenician fleet was put under direct Macedonian and Greek control. Generally, there was no improvement when Alexander took over: rebellious cities were treated as harshly as before, taxes and obligations were heavier, minting was controlled and restricted, and dynastic succession was not guaranteed as rulers were replaced if they were not in line with Alexander’s interests (Verkinderen 1987: pp. 295–308).

CHAPTER 43

Asia Minor

Elsbeth R.M. Dusingberre

Croesus of Lydia, last of the Mermnad monarchs, was defeated by Cyrus the Great in the 540s BCE when Cyrus took Sardis and most of the terrain commanded from that city, extending from the Halys River in the east to the Aegean coast in the west (Hdt. 1.86, Nic. Dam. FGrH 90 F8, Lecoq 1997: pp. 181–183). This historical event is reflected in the archeological record at Sardis by a destruction level: it is one of the rare examples of an archeological horizon clearly to be linked to an event described in historical sources (Cahill 2002, 2010). Sardis became the administrative center of the new satrapy of Sparda, a logical choice for capital because of its commanding and defensible situation. The long history of governing from that city probably also meant that various parts of the apparatus for governing an imperial province – scribes, storehouses, barracks, accommodations for leaders – were already in place. The Greek cities of the Ionian seaboard tried to negotiate with Cyrus after the fall of Sardis; when he rejected these overtures, they asked Sparta for help (Hdt. 1.141–153). Sparta sent a rather feeble warning to Cyrus, who set off again for Mesopotamia to conquer Babylon (Lecoq 1997: pp. 182–183; Briant 1996: pp. 44–55, 75–80) (Figure 43.1).

The primary concerns of the king in appointing satraps at Sardis were to bind the region to himself, to balance the power of other western Anatolian satraps, and to fend off foreign invasions. Sardis was wealthy, fortified, distant from Persia, and close to Greece. There was no reflection at Sardis of the hereditary dynasty at Dascylium or that of the Hecatomnids in Caria.

Figure 43.1 Map of Achaemenid Anatolia (author's drawing).

The first satrap, left behind by Cyrus, was a Persian man named Tabalus (Hdt. 1.153). He directed an administration that apparently included many local people; the Lydian Pactyes was “in charge of the gold of Croesus and the other Lydians.” After an abortive uprising led by Pactyes, however, Cyrus took reprisals against those who had aided him and appointed another Persian, Oroetes, as satrap (Hdt. 1.154–157, 3.120–127). Oroetes killed Polycrates, Greek tyrant of Samos, and perhaps added Samos to Achaemenid territory. Around 522 BCE, Oroetes moved against the Cappadocians to the east. He also had the Persian Mitrobates, satrap of Dascylium, and his son, Cranaspes, killed. These exploits made Oroetes the most powerful man in western Anatolia.

Darius took the throne in 521 BCE and, according to Herodotus, directly afterward had Oroetes removed from his position. The king secured the area by appointing his brother satrap at Sardis; Artaphernes defended the walled acropolis at Sardis from the ravages of the Ionian Revolt (499–494 BCE) led by the Milesians. The lack of cooperation between the Ionians and the superior military power of the Achaemenid forces led, after several years of fighting, to the successful suppression of the revolt, although not before it involved Caria and Cyprus as well as Ionia (Hdt. 5, 6; Thuc. 3.65, 82; Balcer 1984: p. 227). The Persepolis Fortification tablets document the journey from Sardis to Persepolis of one Datis in 494 BCE; this was probably Datis the Mede, who later commanded the Persian expedition at Marathon, perhaps bringing to the king at Persepolis an account of the successfully quelled rebellion (PFT Q 1809; see Lewis 1980). Thus the first 50 years of Persian rule in Asia Minor were defined by the desire for territorial control: the Lydians attempted to regain control of their old capital; the satraps sought to take control of larger tracts of land; the Ionian city-states fought to acquire control over the seaboard and hinterlands.

Artaphernes’ measures in assessing taxes and military obligations in 493 BCE included a careful survey of land (Hdt. 6.42–43). They stayed in effect through the entire fifth century BCE and may have been the basis for the tribute exacted by the Athenians from those Ionian city-states that joined the Delian League (Balcer 1984: pp. 204–205). That the military obligations established by Artaphernes were honored may be seen in the lists of peoples in the Achaemenid army that invaded Greece (Hdt. 7.60).

The earliest Achaemenid archeological deposits at Sardis date to the end of the sixth century BCE (Dusinberre 2013). They include quantities of the cup called the Achaemenid bowl, a shape that held particular significance at Persepolis in the authority-charged visual renditions of the Apadana reliefs. Significantly, the Achaemenid bowl has no precedent in Anatolia before the Persians arrived. Silver, glass, and ceramic Achaemenid bowls were popular almost everywhere in Achaemenid Anatolia. What is interesting is the

Figure 43.2 Ceramic Achaemenid bowls from Sardis. Source: Reproduced by permission of the Archeological Exploration of Sardis/Harvard University.

tremendous standardization of the vessel in shape and quality. Because it is impossible to hold or use these vessels as one would a cup with handles and a foot, using them demanded different drinking behaviors. This new shape required a new hold and style of drinking. Thus, down to the very lowest levels of society, even where people were continuing to use traditional shapes and behaviors at the same time, new behaviors infiltrated too. People across Anatolia engaged in drinking practices that united them to the new imperial authority (Figure 43.2).

Royal intervention at Sardis was great. Both Darius and Xerxes used the city as a base for their forces before and during combat with Greeks in 490 and 480 BCE, a time when Artaphernes' son, Xerxes' cousin Artaphernes II, was confirmed as satrap (Hdt. 6.7). Xerxes spent the winter of 479 BCE at Sardis and may have enhanced its great fortification wall while there (Hdt. 8.116, 9.108–109; Cahill 2010).

Imperial authority was famously asserted in Anatolia during Xerxes' progress through the land around 480 BCE, on his way to Greece. His reminders of kingly hegemony were established across the peninsula and showed remarkable diversity of approach and statement. I mention five here (Dusinberre 2013):

- 1) Xerxes' inscription at Van, in Babylonian, Elamite, and Old Persian, overtly extends kingly reach into the mountains and valleys of Anatolia. The inscription's use *only* of Mesopotamian and Persian languages makes a strong statement about that reach: This is a foreign overlord who now exerts authority over the ancient lands of Urartu. By mentioning Ahuramazda and Darius, Xerxes affirms his connection to his father's religion and his own rightful rule. Expanding on the language of Darius' inscriptions at Persepolis, Xerxes begs the god's protection for his entire empire and the effects of his deeds: it is a highly visible and powerful royal declaration of empire and authority (see also Jacobs 2012b).

- 2) Entering Lydia, Xerxes was so struck by the beauty of a plane tree that he adorned it with gold and established a permanent caretaker for it. This made a strong statement of wealth and power to the ancient local populace, one that had tremendous impact on the imagination of generations.
- 3) Xerxes also marked his passage by leaving his name on significant gifts. Offering as gifts the paraphernalia of banqueting, marked with the royal name, certainly formed part of his interaction with local elites. An example is the alabaster alabastron found at Halicarnassus that bears the inscription “Xerxes, the great king” in Old Persian, Elamite, Babylonian, and Egyptian.
- 4) Two seals represented by impressions on the Dascylium bullae bear the name of Xerxes, written in Old Persian. It is significant that royal name seals, with their powerful connections to Persian royal court protocol and expression, turn up at the Anatolian satrapal headquarters farthest from Fars. The royal name seals at Persepolis were used not by the king but by important imperial administrative offices or officials; the royal name seals at Dascylium functioned as part of the network binding satrapal and other centers to the imperial administration.
- 5) Xerxes founded a citadel and palace at Celaenae, augmented perhaps later with a paradeisos or royal garden, on his way back to Persia. These were assertive statements of continued imperial power, as well as being practical edifices at the headwaters of the Marsyas River. After the defeat by the Greeks, securing this passageway from the Aegean to the Anatolian interior might well have seemed necessary. The situation of the buildings was also appropriate as a reminder of kingly presence for local elites, however.

Xerxes thus drew on a great array of expressions to imprint his authority on the people of Anatolia. These served as permanent reminders of Achaemenid hegemony even after his vast army had departed from Anatolia.

In 479/8 BCE the Samians led a second Ionian revolt that achieved Samian independence from Achaemenid (but not Athenian) tribute. Significantly, the important port city of Miletus was not a member of the uprising. The fact that the Lydians did not join the Ionians in either revolt demonstrates the degree to which they had been assimilated into Achaemenid hegemony.

Living in Asia Minor under Persian rule included folding the local elite into the new regime. It is not clear how the Achaemenid administration first brought about the remarkable cohesion of the elite, but the consistency of manner in which people demonstrated their membership in the polyethnic elite of Achaemenid Anatolia – the consistency of portable elite culture – is striking (Dusinberre 2013; against the notion that Achaemenid ideology was

signaled visually, see Jacobs 2012a). The elite signaled their status in a great variety of ways: their clothing, their drinking and dining behaviors and apparatus, the imagery and style of their personal sealstones, the size and kind of mortuary structures they constructed and the nature of their mortuary inclusions, their adoption of Persianizing equipment such as horse trappings and behaviors like public greetings, the gifts they exchanged to cement relations among one another, even architectural power statements. The meaning and significance of these behaviors led to great continuity across Anatolia.

Indeed, it seems when a man or woman was signaling membership in the Achaemenid elite, this was the primary identity that mattered, rather than ethnicity or some other aspect of identity (Dusinger 2013). Within the rubric of “elite identity” was room to signal individual preferences and identity as well. Naming patterns demonstrate this. Several sealstones were carved with Achaemenid hegemonic iconography and inscribed in Lydian with Lydian names claiming ownership. Others were carved with a similar collection of images linking their users to Achaemenid authority and in styles situated, it seems, in Anatolia; but they were inscribed in Old Persian cuneiform naming the kings Xerxes and Artaxerxes, in Aramaic with Persian names, or in Aramaic with names of another ethnicity altogether. Thus these individuals signaled membership in the elite via an Achaemenid iconographic system of visual authority, but they differentiated themselves within that category by the languages deployed on their sealstones and the ethnic backgrounds of their own names or those of the kings to whom they proclaimed allegiance.

Ethnic identity clearly mattered at times, however. Imperial texts and reliefs accentuate notions of ethnicity as distinctive indicators of identity, within a framework of universal empire: Like the United States motto, Achaemenid ideology emphasizes a sense of *e pluribus unum*. The imperial ideology emphasizes the unity of many rather than any notion of ethnic identities in isolation. Thus the Apadana presents instances in which gifts visually mute idiosyncrasy and create imperial cohesion (Root 2007). In this context, it can be seen as a demonstration of imperial strength, as well as regional autonomy, for different peoples of the realm to speak different languages and continue differing social customs.

In some instances, ethnic Persians themselves may have formed the elite. Nick Sekunda has argued that three large landowning families in Hellespontine Phrygia were ethnically Persian and suggested that analogous social structures were to be found elsewhere in western Anatolia as well (Sekunda 1988). Although some evidence, such as the Sacrilege Inscription from Ephesus, demonstrates that names of a given ethnic background need not indicate that same ethnicity on the part of their holders (Hanfmann 1987), Sekunda’s is a plausible scenario given what we know of landholding in Persia and of imperial colonization and consolidation in general. Historical texts provide clear

evidence that Persians also employed local elite leaders to govern and control regions of Asia Minor, however, including Pythius of Lydia in the mid-sixth century BCE and Zenis and Mania in the Troad late in the fifth century BCE (Hdt. 7.28; Xen. Hell. 3.1.10–15). Indeed, the very mix of ethnicities in the names of the Sacrilege Inscription demonstrates a mingling of ideas and sharing of cultural aspects across ethnicity in Asia Minor.

The problematic Peace of Callias, a treaty which may or may not have been signed after the Battle of the Eurymedon River in either 469 or 466 BCE, purports to have given autonomy to the Ionian city-states on the Aegean coast – but it is unclear whether it in fact ever existed (see, e.g., Bosworth 1990). If so, it reduced the responsibilities of the satrap of Lydia for some decades at least. Following Artaphernes II, sometime after 450 BCE, another member of the royal family was satrap at Sardis: Pissouthnes, possibly grandson of Darius I and son of Hystaspes II, who assisted the Samians when they revolted against Athens in 440 BCE (Thuc. 4.115–117; Balcer 1984: p. 168, 176). He was replaced during the turbulent years of Darius II by a man named Tissaphernes, perhaps a distant relative (Kuhrt 2007: p. 339). Tissaphernes is portrayed by Thucydides as a cheater, a liar, one who could not be trusted. If viewed from his own side, however, he may be seen as a brilliant diplomat who kept the Greeks at each other's throats and in 412/11 BCE led them to sign a treaty that granted back to the king all the land in Asia Minor that had been his – effectively undoing the depredations of the Ionian uprisings and all the uncertainties in the years around them.

Ironically, the resolution of conflict between Greeks and the Achaemenid Empire in western Anatolia allowed the satrap of Sardis to turn his attentions inward, toward power in the empire itself. In 407 BCE, Darius II appointed his younger son, Cyrus, to be satrap of Lydia, Greater Phrygia, and Cappadocia (an enormous area) and relegated Tissaphernes to Caria and Ionia (Briant 1996: pp. 608–629). This act afforded great power and wealth to one of Darius's sons even as it removed him from central imperial oversight and authority. The nomination of Cyrus the Younger to this position coincided with the arrival in Sardis of a particularly active and charismatic Spartan nauarch, Lysander. The two became allies, and in 406 BCE Lysander was able to reinforce his navy with ships and men, thanks to the resources Cyrus made available to him. In 404 BCE, his father died and his Spartan allies won a decisive victory over the Athenians at Aegospotami. It was just after this that Cyrus used his satrapal headquarters as a base to launch a revolt against his brother, the new king.

Cyrus' preparations were stealthy. He sponsored exiles in various cities and wooed people coming from court; when Sparta offered ambivalent support, he recruited mercenaries in cities of European Greece rather than Anatolia (Kuhrt 2007: pp. 356–358). He claimed to the Greek mercenaries in his

service that he was amassing his troops to lead against Tissaphernes in Pisidia (Xen. Anab. 1.1–2; Plut. Artax.; cf. Diod. Sic. 14.11; Nep. Alc. 9; Plut. Alc. 37–39). In 401 BCE, he led the same troops to Babylonia instead in an effort to overthrow his brother, Artaxerxes II, king since 404 BCE (Briant 1996: pp. 633–637). He was decisively defeated at the battle of Cunaxa in 401 BCE.

It is not clear to what extent Cyrus' rebellion was supported by other Persians in Anatolia. Greek sources by and large claim the satraps of Anatolia and the Persian elite in general were loyal to Cyrus and in direct or implied opposition to Artaxerxes II (Xen. Anab. 1.8.9, 2.1, 3.2; Xen. Oec. 4; Ctes. FGrH F8; Diod. Sic. 14.19, 24; 2.5; Arr. Anab. 2; Plut. Artax. 11). But some of the satraps along the way blocked the passage of the army, and many other members of the elite clearly did not support his endeavor (Xen. Anab. 1.14; Diod. Sic. 14.20; Briant 1996: pp. 643–644).

Tissaphernes, who had traveled in person to warn the king of Cyrus' approaching army, was reinstated in his previous position, perhaps even with expanded territories under his control (Xen. Hell. 3.1, 14.1; Diod. Sic. 14.35, 80; Polyae. 7.11; Hell. Oxy. 14). His first acts at the beginning of the fourth century BCE make it clear that he wished to govern with overt allegiance to the central imperial authority; thus when the Ionian cities refused to pay tribute, he ravaged the territory of Cyme and besieged the city (Xen. Hell. 3.1; Diod. Sic. 14.27). The spring of 399 BCE saw the renewal of hostilities between Greeks and the Achaemenid troops in western Anatolia.

The Greeks first described the ensuing war as simply against Tissaphernes, and the Spartan general Thibron moved against the satrap's main military bases at Magnesia and Tralles (Diod. Sic. 14.36). His successor in 398 BCE, Dercyllidas, however, made a truce with Tissaphernes in order that the Spartans might wage war against Pharnabazus, satrap at Dascylium; he freed various Ionian city-states from Achaemenid hegemony and put down some Chian exiles who had been launching raids against the Ionians (Xen. Anab. 7.6, 7; Xen. Hell. 3.1, 2). Meanwhile, Artaxerxes II made Pharnabazus subordinate to Tissaphernes, to whom he granted full military power in the west. Tissaphernes overcame the Spartan army thanks to his large cavalry. The Spartans refused to sign a truce that banned both Spartans and their army from Anatolia, but withdrew for the time being. The summer of 397 BCE saw major rearmament on the part of Artaxerxes, who began building a formidable navy. Tissaphernes was defeated by the Spartan king Agesilaus outside Sardis in 395 BCE and was replaced as satrap by Tithraustes, who won a series of military victories on land. Pharnabazus, satrap at Dascylium, led the new navy to a decisive Achaemenid victory at Cnidus in 394 BCE (Xen. Hell. 3.4; Hell. Oxy. 19; Diod. Sic. 14.35, 80). This series of events reestablished Achaemenid power in Ionia.

Tithraustes was recalled by the king and replaced with an old friend and adviser, Tiribazus, who was granted the satrapy and some form of overarching

military command (Xen. Hell. 4.8; Xen. Anab. 4.4; Diod. Sic. 14.85; Plut. Artax. 7). With Tiribazus, the Spartan king Antalcidas finally agreed to a peace treaty: The Spartans would withdraw from Anatolia, and all the Greek cities of the Anatolian mainland would pay tribute to the Achaemenid Empire, leaving the islands and European Greece autonomous and free of tribute obligations. Although the king initially rejected the treaty, three years later, in 386 BCE, he agreed to it (Xen. Hell. 5.1). This edict was reaffirmed twice, on the initiative of the king: once in 375 BCE and again in 371 BCE.

Artaxerxes the King thinks it just that the cities of Asia shall be his and of the islands Clazomenae and Cyprus, and that the other cities, small and great, shall be autonomous except Lemnus, Imbrus, and Scyrus; these shall be Athenian as before. Whichever side does not accept this peace, I shall make war on them along with whoever wishes, by land and by sea, with ships and with wealth.

Tiribazus was confirmed in his command at Sardis, while Pharnabazus was wedded to one of the king's daughters. The satrapies of western Anatolia were thus linked firmly to the king in Persia.

Asia Minor had but short respite from combat, however: the "satraps' revolt" broke out in 361 BCE, and it had surely been brewing for several years before its eruption (Diod. Sic. 15.90; Briant 1996: pp. 675–694). Epigraphic and numismatic evidence from Anatolia and Egypt demonstrates that this so-called revolt probably consisted of a series of local uprisings rather than a concerted and unified effort (Weiskopf 1989; Debord 1999). At any rate, the revolts were all put down, the satraps replaced.

No surviving records detail happenings in Lydia in the next few decades (for a careful analysis of the administration and officials, see Jacobs 1994: pp. 103–104). At the time Alexander arrived, in 335 BCE, Sardis was still fortified: Alexander was reportedly impressed by the triple wall on the acropolis (Arr. Anab. 1.17). But the satrap, Mithrenes, opened the gates without struggle and made over the treasury for Alexander's usage (Arr. Anab. 1.16, 17; Diod. Sic. 17.21). Archeological evidence demonstrates that Sardis' inhabitants continued to thrive into the Hellenistic period. Thus the political history of Achaemenid Sardis, torn with wars and conflict, ends with a decision to surrender that enabled its inhabitants to continue living along much the same lines, exploring intercultural opportunity and personal taste.

It is clear from literary and epigraphic evidence that maintaining political and military control of their regions was one of the most important duties of satraps (Tuplin 1987; Dusi 2013). Thus the Persian Asidates had a large fortified estate in Mysia, peopled with slaves and dependants; the land around it was "populated with military colonists and garrisons and bristl[ing] with small forts" (Briant 2002: p. 643). Aeolis, too, included a network of

small forts, commanded by the military leader of the surrounding areas. Increased population in the Granicus river valley in the fifth and fourth centuries BCE as well as in the Caecus River valley, the lower Hermus, and the Maeander, may have been the result of security concerns, providing a sort of “buffer zone” for the empire. Troops could be called up from a wide area in case of need, as demonstrated by Herodotus’ description (5.102) of the Persians holding land grants west of the Halys river who were mustered when the Ionians burned Sardis in 498 BCE. The presence of troops would have had a profound impact on those living in Asia Minor under Persian rule.

Some archeological evidence exists for military establishments; thus Sardis was protected in the Achaemenid period by multiple rings of walls, of which two have been excavated (Cahill 2010; Dusingberre 2013). At least part of the city extended beyond the fortification walls and was vulnerable to destruction; the lack of extensive Achaemenid-period remains within the city walls may indicate a scattering of the population, with the exception of the garrison housed on the acropolis. That acropolis was heavily fortified. Another satrapal site, Dascylium, was defended by a stronghold and a garrison, and it saw two major phases of construction during the Achaemenid period that added to its defensibility.

Two specifically military sites have been excavated in Anatolia. Meydancikkale was a fortress on a hilltop in western Cilicia (Davesne and Laroche-Traunecker 1998). Achaemenid remains include a massive fortified gate with three towers, a cistern, and magazines. Aramaic inscriptions give the name of the city as KRŠBYRT, “fortress of Kirshu.” Remains of two reliefs recalling the Ionian tribute bearers from Persepolis would have reminded local soldiers of the king to whom they owed their loyalty.

Jutting above the hills of north-central Lydia is the rock outcrop of Şahankaya. Nearby tumuli demonstrate Achaemenid-period occupation in the vicinity, and a slingshot bullet inscribed with the name of Tissaphernes demonstrates military importance for the site by the late fifth or early fourth century BCE. Fortification walls at Şahankaya date to the late Achaemenid period. A fourth-century (?) watchtower dominates the site and provides a view over northern Lydia: “its intervisibility with Sardis and many other points in central and northern Lydia make it a very strategic place” (Roosevelt 2009: p. 121). A square plinth near the top of the outcrop is topped by a rounded protrusion of stone with a shallow basin in its top, probably the base for a signal fire (Dusingberre 2013).

Information on taxes and household structures gives us some additional sense of what it was like to live in Asia Minor under Persian rule (Dusingberre 2013). Thus a recent study compares the Mnesimachus Inscription at Sardis with two Aramaic inscriptions in Lydia and suggests that estates in western Anatolia were centered on large houses perhaps occupied by the estate owners

and their families (Roosevelt 2009: pp. 113–114). The estates included vineyards, gardens and orchards, and fields. Larger estates included outbuildings for laborers (slaves?), as well as livestock and farm equipment, and may have had settlements of tenants who worked estate lands perhaps as sharecroppers. These estates served as residences and work areas for food processing and craft production. Estate owners, like the satraps in turn, garnered revenues in the form of labor, money, agricultural goods, and wine vessels.

Interestingly, neither religious expression nor the use of specific languages, with the possible exception of Aramaic, seem to have been exploited extensively by the central imperial authority as an avenue of imposing power on Anatolia (Dusinberre 2013). Rather, these potentially ideologically charged avenues of communication were granted a great deal of autonomy. Religious expression does not provide a single impression: religious belief and practice were complex and do not neatly fit any one interpretive framework. In a way, they demonstrate the simultaneous flow of authority and autonomy, here practiced perhaps by religious leaders rather than by government officials. It is clear that there were times when local political figures attempted to use religious cult to increase their authority. It is equally clear, however, that the Achaemenid administration did not effect any systematic conversion of cult to reify its own authority. In general, religion seems to have been a way for local populaces to exercise autonomy over a key aspect of their own culture and life systems.

A similar official approach to language seems to have pertained (Dusinberre 2013; cf. Jacobs 2012b). Epigraphic evidence demonstrates that local languages were inscribed through the Achaemenid period. Particularly regional in language use were funerary markers, which often were inscribed in a local language even when little evidence exists for an earlier epigraphic tradition and when significant evidence exists for the simultaneous use of an additional language. The notion that Aramaic served as a koine is perhaps borne out by the presence of Aramaic inscriptions on seals, while a number of bilingual inscriptions suggest that Aramaic had status as a “powerfact” language, linking the inscriber with the might of imperial authority no matter what his ethnicity.

An essential aspect of living in Achaemenid Anatolia concerned minted money (see Dusinberre 2013 for this discussion of coins). Although Lydia and some Greek city-states of Ionia certainly used minted coins earlier, the Achaemenid Empire contributed tremendously to the monetization of Anatolia. Silver and bronze coins circulated widely by the end of the Achaemenid period, with mints in western and southern Anatolia particularly active. Their distribution and the wear they show demonstrate that the less valuable coins, at any rate, entered the public economy and served as a medium for exchange.

The most familiar coins of the Achaemenid Empire are the imperial issues, gold darics and silver sigloi (although Corfù 2010 suggests the archer coins are not Achaemenid at all). These coins bear on the obverse an image of a figure wearing the Persian court robe and dentate crown, carrying a bow and sometimes other weapons. The coins are hence generally designated “archers.” How well Achaemenid coins functioned as recognized signifiers of the Persian king’s might is clear from Greek sources. When the Spartan Agesilaus withdrew from the Troad in 394 BCE, he is said by Plutarch to have claimed he was driven from Asia by the king’s 30,000 archers (Plut. Artax. 20). It is the king’s *gold* archers to which he refers, used by Artaxerxes II to foment revolt in Greece against Sparta.

The earliest type of archer coin minted clearly suggests the idea of a divine figure holding a bow: only the upper half of the figure is portrayed, emerging from a crescent. The format recalls earlier Assyrian portrayals of the god Assur and contemporary Achaemenid images of Ahuramazda(?) on seals and wall reliefs. And yet the crenelated crown worn by the figure links him to representations of the king in an almost symbiotic association. The figure represents an image of divine kingship.

In the fourth century BCE the production of silver sigloi petered out; apparently these coins were increasingly replaced in western Anatolia by what have been considered issues by local satraps. These new coins bear an imperial statement of conflated kingship and divinity, like the other imperial issues, but couched in stylistic terms that would have increased their impact on local audiences (*pace* Jacobs 2012a,b). A case study will serve to make this point: the “tiarate head” coins.

The tiarate head series were silver and bronze coins minted in western Anatolia in the fifth and especially fourth century BCE. They bear on their obverse a bearded head, usually in profile, wearing the so-called tiara, or “Median” headgear, a soft cap with side and back flaps – the headgear a Persian warrior would wear into battle: the heads display a generalizing and idealized stereotyped image. Unlike the archer coins, the tiarate head coins bear a figural reverse instead of a simple incuse punch. Some include on their reverse motifs of particular Greek cities – e.g. the owl of Athens or the kithara of the Chalcidians. But whereas the coins show the motifs of Greek cities, they are inscribed in Greek “of the King.” The imagery, the style of carving, and the language of inscription leave little room for doubt that the intended audience of the coins was Greek.

The obverse of these coins conveys a message parallel to that of the coins they replaced. Sigloi and darics showed a figure representing both kingship and divinity; the tiarate head coins, too, show a militant Persian figure. On the Apadana reliefs at Persepolis, the military costume seems to have served specifically as a symbol of the king as warrior. On the tiarate head coins, the

garment is particularly charged. In addition to its symbolic value, it bears particular meaning for its local audience: those who actually *saw* the king would have seen him as a warrior.

These coins take a Greek portrayal of godhead and replace it with the head of the Persian king; on Greek issues, a head on the obverse of an issue is always that of a deity. The heads of the tiarate coins thus show the head of kingship, associated with divinity by allusion to heads on Greek coins. They combine practical and symbolic use in a single artifact.

A final category of evidence, mortuary remains, is particularly helpful in understanding what it was like to live in Asia Minor under Persian rule (Dusinberre 2013). Some people were buried in tombs carved into cliffs, others in simple cists, still others in chambers or sarcophagi covered by tumuli. Some had elaborate grave stelae or other markers. Some were entombed in temple-shaped mausolea or other distinctive structures. Certain forms followed local traditions, while others demonstrated radical new departures. The frequently local, geographically bounded, variability suggests that mortuary structures might serve as a way for local populaces to claim adherence to pre-Achaemenid traditions. At the same time, mortuary inclusions demonstrate uniformity of social agenda and presentation – particularly among the wealthy. Thus although mortuary *structures* show great local variability, mortuary *assemblages* do not.

This is important: the mortuary assemblages of the elite display conformity in visible culture and behavior (Özgen, Öztürk 1996; Baughan 2004; Delemen 2007; Miller 2007; Cahill 2010; Dusinberre 2013). Sealstones in semi-precious and other stones, or such materials as glass, share a basic iconographic repertoire of imperial power, even when the styles in which they were carved vary. Silver, gold, and bronze drinking assemblages include vessels of the same shapes, apparently used for the same purposes. Jewelry in bronze, copper, silver, and gold is crafted in forms charged with imperial meaning and elite nuances. Semi-precious stones and enamel inlays are used in the same colors and ways in bracelets, earrings, and necklaces. Gold foil clothing ornaments share iconography linked to Achaemenid imperial might. Even horse trappings signal prestige. The artifacts designed for the behavioral signaling of Achaemenid authority were objects in full public sight, designed to make a statement about the social identity and status of an individual (Figure 43.3).

Banqueting was an essential mortuary behavior. It is shown in visual representations associated with tombs across Anatolia. In addition to silver wine-drinking assemblages, grave goods made of clay emphasize the importance of banqueting. The overwhelming majority of ceramic vessels from tombs are drinking vessels – cups, storage vessels, mixing vessels, and pouring vessels – as well as wine-serving or -flavoring implements such as ladles, and frequent unguentaria. Of the more than 250 vessels recovered from tombs at Sardis, for instance, at least 100 are drinking vessels and another 100 or so are

Figure 43.3 Tomb Karaburun II, Banqueter on western wall. Source: Reproduced by permission of Stella Miller-Collett.

unguent vessels (Baughan, in Cahill 2010). Providing the dead with the means for proper banqueting, including such requisites as scented oils, clearly mattered to survivors. The importance of the specifically Persian drinking behaviors required by the new vessel shapes has already been discussed. Thus mortuary evidence illuminates the cohesion of the elite in various behaviors at the same time that it highlights differences across the various geographic regions of Asia Minor, each with its own history and identity.

I want to end with one important last aspect of identity: the freedom to express personal taste. The variety of artistic styles represented in Achaemenid Anatolian seals shows that patrons as well as artists could make individual choices based on their personal taste and personal identity as well as any number of other factors (Root 1991; Kaptan 2002; Dusingberre 2013). The range of styles found in grave stelae, even those found in the same area, is also profound. Achaemenid Anatolia was a place where imperial authority could be and was expressed powerfully, but it was also a place where individuals exercised autonomy, mostly in ways that allowed them to express their individual identity within the rubric of administrative authority.

CHAPTER 44

Cyprus and the Mediterranean

Andreas Mehl

Cyprus (Figure 19.1) was a western outpost of the Achaemenid Empire, the only one of some importance to be situated not only on the coast of the Mediterranean Sea but in the sea itself. Yet, with its mixed population, a strong part of it being Greek, it resembled the Persian satrapies in Asia Minor, and especially their coastal regions. In this chapter, after a short survey of the sources, important events and situations regarding Achaemenid Cyprus will be summarized, and some structural topics, especially Cyprus' position in the Achaemenid Empire, the Cypriot city-kingdoms, and the relation between Greeks and Phoenicians on the island, its modern controversial discussion included, will be dealt with in detail.

Sources

Any knowledge on Achaemenid Cyprus depends on evidence given by scattered fragments of information in sources of different types (Zournatzi 2005, translated sources in Wallace and Orphanides 1990; Knapp 1996). Most of what one sees in excavated ancient Cypriot towns is of Roman imperial or even late Roman and early Byzantine time. Nonetheless, there is architectural evidence of Achaemenid time as, for example, the palace of Vouni in north-west Cyprus near the ancient town of Soli, or the presumably Persian siege ramp and the tunnels dug under this ramp at (Palaia) Paphus (see below), and, of course, non-architectural archeological evidence as pottery or statues

of city kings (for the historical interpretation cf. Tuplin 1996). For excavations, archeological finds, and their historical interpretations in the first instance one should take a look at the “Report(s) of the Department of Antiquities Cyprus” and the volumes of the “Centre d’Études Chypriotes.”

For the Achaemenid time, inscriptions from Cyprus itself are written in three languages and different scripts (Collombier 1991): Those few that are assigned by research to the so-called Eteo-Cypriots (but see below) cannot yet be read. Useful information is given by some of the Phoenician inscriptions (Masson and Sznycer 1972; Yon and Sznycer 1992, Amadasi Guzzo 2017). Among the Greek inscriptions, nearly all of those written in the Greek alphabet are dated not before Hellenism (*Inscriptiones Graecae* Vol. XV Part 2: will be published in 2020), but the inscriptions that are written in a syllabic script used only in Cyprus, are important for archaic, classical, and even Hellenistic Cyprus. Apart from new finds these inscriptions have been published and commented by Masson (Masson 1983, cf. Egetmeyer 2010 and many other publications: the latter is preparing the publication of the syllabic texts in *Inscriptiones Graecae* Vol. XV Part 1). Greek literature about Achaemenid Cyprus, especially historiography such as the works of Herodotus, Thucydides, being contemporaries, or much later Diodorus, were written outside Cyprus by authors not being from the island. Isocrates’ three Cypriot orations and pamphlets, written between c. 374 and 365 BCE, must be used very cautiously because of their evident Greek nationalist temper and their idealizing tendency (Körner 2017: pp. 71–98, 184–202, 300–310).

Political Events and Situations

Cypriot city kings must have placed themselves under the Persian Great King as the new power of the Near East perhaps as early as when Cyrus attacked the kingdom of Lydia about the year 546 BCE, and at the latest when Cambyses made war against Egypt in 526/5 BCE (Mehl 2009a,b: p. 64, for the whole paragraph Stylianou 1989; Tuplin 1996; Zournatzi 2005; especially Körner 2017: pp. 183–289). On the one hand, the Cypriot kings now had to help the Persian kings as before they had helped the Neo-Assyrian princes in their military ventures (Mehl 2009a: pp. 203–205, more detailed Körner 2017: pp. 133–156). On the other hand, the Great King was not present on coins issued by the Cypriot kings, who indeed were the sovereigns of the people in their city-kingdoms. In the first years of the fifth century BCE, when the Ionian Greeks revolted against the Persian domination, in Cypriot Salamis Gorgus remained loyal, but his brother, Onesilus, chose the side of the Ionians, usurped the throne, induced the other city kings to join his secession, and besieged Amathus because its king was the only one not to join. Although the

Cypriots got help from the Ionians, in 497 BCE the Persians besieged the towns of Salamis, Soli, and Paphos, subdued the rebellious Cypriot city-kings, and restored Gorgus to the throne of Salamis.

In Xerxes' I war against the Greeks in the motherland, the Cypriot city kings fought in the Persian fleet and together with the fleet were defeated in the naval battle off Salamis (480 BCE). During the following decades the Athenians tried several times to win over Cypriot city kings in order to expand their maritime empire into the eastern Mediterranean. Nevertheless, their slogan of freedom of Persia did not find approval in all Cypriot kingdoms. At least the kings of Marium, Citium, and Salamis resisted them (450/49 BCE). Phoenician rule in Marium and troubles caused by that rule seem to be a fiction of modern research (Mehl 2013a: pp. 147–148). At some time the king of Citium made war, perhaps twice, against the kingdom of Idalium and in the end conquered it (Mehl 2004: p. 19, Körner 2017: pp. 230–233, cf. the inscription in Masson 1983: no. 217).

In the second half of the fifth century BCE Phoenicians usurped the throne of Salamis. A young man claiming descent from the old royal family of the Teucrids, Euagoras (I), was forced to flee. He returned with some friends and managed to become king of Salamis. During his long reign he tried to expand his power on the island and was successful for some time. Only when the remaining city kings of Citium, Amathus, and Soli intervened at the court of the Great King, Artaxerxes II, was the Persian military machine moved off against Euagoras, but the latter managed to delay the action for years by intriguing between the great king's functionaries and generals, and even to annex some part of Phoenicia. Finally, he was besieged in Salamis and capitulated in 381 BCE, but nonetheless he was granted a treaty "from king to king" (Diodorus 15.9.2), securing his rule over Salamis. When some time after Euagoras' death (374 BCE) Phoenicia and Cyprus revolted, both were subdued a few years later in 345 BCE. Nonetheless, the Great King Artaxerxes III did not replace indirect rule by direct administration. About the middle of the fourth century BCE the king of Citium and Idalium was also king of Tamassus. Only after Alexander the Great had won the battle of Issus against Darius III and had entered Syria did the Cypriot city kings leave the Persian side in 332 BCE and join him, though it may be that not all of them did so at the same time. As from now, they fought against the Persian Great King.

The Island, Its Economy, People, and Political Structure

In contrast to the Aegean Sea with its many islands, Cyprus is – besides the ancient cities of Tyre and Aradus – the only island in the eastern Mediterranean. It is situated near to the Asiatic continent in an angle, the peak of which is the

region of Flat Cilicia with the today Gulf of Iskenderun and the sides of which are the southeast coast of Asia Minor and the Syrian or Levantine coast. The minimum distances from Cyprus to the continent are about 65 km toward Rugged Cilicia and 95 km toward north Syria. With its area of about 9250 km² it is one of the large islands in the Mediterranean. Its surface is formed by two mountain ranges and a plain in between them, and its long coastline is mostly rocky and mountainous and not so often sandy and plain. In antiquity most of its ancient towns were situated on the coast and so – unlike today – most people lived near the sea and the jobs of many men depended on overseas trade. Nonetheless, Cyprus' important products did not come from the sea but from the island's agriculture, forestry for timber, and mining, melting, and processing of copper, a big part of these activities presumably being under the city kings.

The island's population consisted of Greeks (more), Phoenicians (less), and, especially in the town and region of Amathus, perhaps people for whom modern research has invented the name "Eteo-Cypriots" ("true Cypriots"), so describing them as indigenous (Seibert 1976; Wiesehöfer 2000). However, Given (1991: pp. 6–39 and 184–195) and Reyes (1994: esp. 13–17 and 22) deny the historical existence of the Eteo-Cypriots and in consequence that of their inscriptions. Egetmeyer (2009) argues against their positions. Though he seems convincing, in all historical actions and situations of the island and its towns we find Cypriots who are, or at least seem to be, either Greeks or Phoenicians. Cyprus' geographic-political pattern until early Hellenism being the city-state ruled by kings, the population of the city-kingdoms was not ethnically pure but mixed (cf. Körner 2017: pp. 71–128). Most city-kingdoms had a Greek majority; only the kingdoms and towns of Citium on the south coast and Lapethus on the north coast were shaped visibly by Phoenicians. Altogether, the island was not divided into a Greek and a Phoenician part. So, Salamis was predominantly Greek, its neighbor Citium Phoenician, further to the west Amathus was mixed, Curium and Paphus Greek. As a result, Greeks and Phoenicians, and perhaps the Eteo-Cypriots lived side by side. What this means will be discussed below.

Persian soldiers of whatever ethnic origin (with the possible exception of a garrison in Salamis) were on the island several times, though never for long periods. In any case, they were there in the first decade of the fifth century BCE, to suppress the participation of Cypriot city kings in the Ionian Revolt, and later on during the Athenian fights for Cyprus. At that time presumably they were also in the war together with troops of the king of Citium against the kingdom of Idalium in the early fourth century BCE to put down the king of Salamis, Euagoras I, and about the middle of the same century to subdue revolting Cyprus again. There seems to be exciting archeological evidence for Persian troops besieging the town of Paphus, but though a lot of objects have

been found in Cyprus that may be defined as Persian, there is – in contrast to Asia Minor but in accordance with lower Babylonia – no proof of Persians living on the island for a longer time. The so-called Achaemenid palace of Vouni can – contrary to other opinions – be considered neither the seat of a Persian official nor that of a Cypriot city king who wanted to demonstrate a pro-Persian attitude (Petit 1991; Tuplin 1996; Zournatzi 2005).

During most of its history Cyprus' fate was influenced and even determined by empires from beyond the island. So Cyprus being a part of the Achaemenid Empire was a normal situation. There were various reasons for Cyprus being dependent on or even subject to external powers. The island was situated near to the Asiatic mainland. Its natural resources, especially its copper and timber, were of much interest, as was the maritime experience of many Cypriots. In the period of interest here, its internal structure also facilitated the annexation of Cyprus: From the beginning of historical evidence the island was not a political unity, but nearly each of its towns together with its countryside was governed by its own prince, and none of these city kings was in a position above the other city kings (also for the following Watkin 1988; Zournatzi 1996, 2005; Mehl 2009a; Körner 2017: *passim*). Even the king of Paphos, who combined the royal power with the rank of the high priest of Cyprus' main goddess "Wanassa" ("Mistress," in Greece Aphrodite), did not have a superior position. The number of these small kingdoms varied around the figure of 10 (Iacovou 2002, Körner 2017: pp. 44–57), though maybe the number changed more than we see in our scarce evidence. As events and situations in the Achaemenid period show, joint actions of Cypriot princes never included all of them, and some kings tried to annex other city-kingdoms (see above pp. 614–615). Cyprus' city kings were interested in their own kingdoms and personal power, and at least some of them rivaled with princes of other city-kingdoms. As civic institutions were rudimentary, the kings' positions and actions were decisive for the city-states' policies, and certainly for their policy toward the other Cypriot city-kingdoms and political powers beyond the island. Modern assessments of Cypriot kingship are strongly influenced by preconceived ideas about the role of Greek and "Oriental" influence (Körner 2017: pp. 293–387 with an abundant overview and an own, reasonable decision for the model of 'traditional rule'; Mehl 2016 gives a critical synopsis).

Before being part of the Achaemenid Empire, Cyprus had been subject to the Neo-Assyrian Empire and then perhaps for a short time to the Neo-Babylonian and late Pharaonic empires (Mehl 2009a,b; Körner 2016, 2017: pp. 130–181: both also for the principle of suzerainty in the Achaemenid Empire). While evidence for the latter two is extremely poor, it tells clearly that Cyprus in the Neo-Assyrian and the Achaemenid empires – as some other regions of these empires – was governed by its city princes and that the latter were under the suzerainty of the Assyrian and Persian Great King respectively,

the Persian Great King being literally “king of kings.” Nonetheless, the Cypriot kingdoms were included in the territorial administrative organization of the empire. So in the evidently multistage organization of the Achaemenid Empire, Cyprus was part of the Syrian subdivision of the satrapy Assyria and the super-satrapy Babylonia, and so the Great King’s representative responsible for the affairs of Cyprus was the royal functionary of Syria (Jacobs 1994: *passim*; also for the following Mehl 2004). However, this did not make it impossible for Cypriot princes to contact the Great King directly. The internal situation in a territory with its own government was of no interest for the suzerain, as long as it did not endanger its affiliation to the empire and the influx of tribute. This explains why Cypriot city kings such as those of Citium and Salamis could annex neighboring city-kingdoms.

Greeks and Phoenicians in Cyprus: A Peculiar Discussion

Some events reported above will have shown that the mutual policy of the city kings and their friendly or hostile position toward the Persian suzerain were not bound to their ethnicity. This seems to be a simple remark, which one will not contradict, but behind it lies a problem: At first glance the present situation with Greeks, being the majority, and Turks, being the minority, on the island may be regarded as analogous to some historical situations, in which also two ethnic, religious, and cultural groups existed in Cyprus – Greeks as the majority and in antiquity Phoenicians, in the Middle Ages French and Italians (Venetians) as the minority, the situation being complicated by the influence exerted by powers from outside the island. So, a special analogy presupposing the equation of the Phoenicians with the Turks is seen between the ancient and the present situation: As Turkey supports the Turks in Cyprus, the Persian government is thought to have been on the Cypriot Phoenicians’ side. The explosive nature of those analogies is seen especially by Greek Cypriots in the political preponderance of the respective ethnic minority and the repression of the ethnic majority, the latter being the Greeks, over centuries and even millennia. This is the background of a controversy like that of Demetriou (1992) against Maier (1985) about the relation between Cypriot Phoenicians, Cypriot Greeks, and the Persians as the masters of the island (for Demetriou’s position cf. already Gjerstad 1948, 1979).

As it is not the task here to check the analogy between present and Achaemenid times in Cyprus, only some evidence for the relation between Greeks and Phoenicians on the island will be expounded in addition to that already given above. As Greeks and Phoenicians lived next door to each other,

one will imagine that sometimes problems arose between individuals, families, or small groups of both. But there is no evidence for such debates or even clashes. On the contrary: a tale of early Hellenistic origin states that in Salamis a young non-aristocratic Phoenician bearing a Greek personal name fell in love with the daughter of king Nicocreon – who was to be the last city king of Salamis – and his wife, whose Greek name “Biothea” must be the translation of a Phoenician (!) personal name, but he was rejected by both the princess and her parents and killed himself. This story may or may not have a historical background, but in any case its details show that it does not reflect a controversial situation on the ethnic but rather on the social level (Mehl 1996: pp. 383–384, cf. 395–397).

The idea that the Phoenicians in Cyprus were in principle on the Persian side, because not only they but also their “cousins” in the homeland Phoenicia were subject to the Persian Great King, does not match the historical reality (see above p. 615). Besides, one must not forget that a significant number of the Phoenicians, those in the western Mediterranean, especially the Carthaginians, lived outside the Persian Empire, while Greeks lived not only outside the Persian sphere in Greece and in the western Mediterranean but also in large numbers in Asia Minor and so, like the Greek Cypriots, within the Achaemenid Empire. Indeed, some of the Greek city-states in Asia Minor were on the Athenian or Spartan side, and at a later time on the side of Alexander the Great against Persia, but others made a Pro-Persian policy against Greek and Macedonian interventions which claimed to free the Greeks from the Persian “yoke.” Among Greeks, Persians, and indigenous peoples living in Asia Minor there was both “iranization and hellenization.” This does not hint at enmity between Greeks and Persians (quotation Keen 1998: p. 61, cf. Briant 2002: pp. 697–709). In a similar way, but without Persians living there, Greeks and Phoenicians co-existed in Cyprus. Their living together may have been facilitated by the fact that the Greeks of Cyprus were not as ‘Greek’ as the Greeks in the motherland and in the west, and that they had some peculiarities in common with the Cypriot Phoenicians, especially the structure of the city-kingdoms (for Cypriot peculiarities cf. Collombier 1995: pp. 583–851). Finally, one should be aware that in contrast to some opinions, perhaps caused, too, by an analogy with modern times, there was no iron curtain between the Greek and the Persian sphere, which would have separated Achaemenid Cyprus from Greece, but on the contrary there was trade and with it the exchange of persons and ideas between both spheres, and Cypriots and Greeks, as well as Phoenicians, took part in this trade and exchange (Mehl 2013a,b). To sum up, there was no fundamental enmity between Greeks and Phoenicians in Cyprus, but a co-existence that will have been altogether friendly (Mehl 1996: pp. 405–406).

CHAPTER 45

The Greek World

Mischa Meier

Traditional Interpretations and Source Issues

The relationship between Greeks and Persians was a complex matter. Of course, since the wars in 490–479 BCE, Greeks considered the Persians to be plainly the “Other,” the true incarnation of “Barbarians.” Moreover, the division of the antique world into Greeks (and later Romans, respectively) and barbarians, a structural constant which existed well into late antiquity and beyond, had its most important roots in the major conflict between Greeks and Persians. During this conflict, associations were made that had a lasting impact on the image of the “other” for several centuries. These included the construction of an East–West contrast that was solidified in a dichotomy between Europe and Asia. In many respects, this contrast was a heavily loaded concept, since it was during the conflict with the Persians that the Greeks first developed an emphatic notion of freedom in terms of foreign affairs in which their own independence was pitted against the supposed despotism of the Orient (e.g. Hdt. 1.5.3–1.6.3; Raaflaub 1985). Indeed, this dichotomy managed to hang on for centuries, wielding a great deal of power over the years in its different forms and modifications. Quite certainly, its influence can even still be found today in different ideas and clichés. For example, many aspects of Orientalism and Eurocentrism can be traced back in a variety of ways to the conflicts between Greeks and Persians in the fifth century BCE (Wiesehöfer 2009).

Nevertheless, there was not only hostility. Unquestionably, *medismós* (collaboration with the Persians) was considered to be a serious offence, even akin to high treason (see Hdt. 6.49; Graf 1984). Even high-ranking individuals were charged with *medismós* (e.g. the Spartan regent Pausanias or Themistocles the Athenian, Thuc. 1.95; 1.128–138; Plut. Them. 29; Schumacher 1987; Blösel 2004); suffixes such as “the Mede” added to the names of those who were to be banished appear repeatedly on Athenian *ostraka*. Yet, none of this prevented a “Persian trend” from developing in Athens during the late fifth century BCE or the lively exchange of goods between Greeks and Persians. A lingering interest in the environments surrounding the Achaemenid Great Kings is also reflected in literature dating back to Herodotus, and especially to Ctesias of Cnidus (Bichler 2000; Rollinger et al. 2011; Wiesehöfer et al. 2010). Greeks also repeatedly entered into the service of the Persians voluntarily (albeit quite often they were compelled to do so) as political advisors or, respectively, honored guests, as military leaders, soldiers, doctors, administrative officials, craftsmen, artists, or workers. As far back as the sixth century BCE, Greeks left their mark on Achaemenid art, such as on the palatial buildings of the Persian Great Kings or on the grave of Cyrus II in Pasargadae. In the fortification inscription of Darius I, Lydians and Ionians are named as craftsmen who were involved in the building of the palace of Susa, and Greeks also contributed to the design and construction of the palace of Persepolis, which was finished under Artaxerxes I. The reverse also holds true as Persian influences can be found in architecture and artifacts in Greece and Asia Minor, respectively (Rollinger 2006: pp. 138–145; Wiesehöfer 2009: pp. 171; 174; 178–179; Marek 2010: pp. 214–226).

For the most part, however, the complex interrelationships between Greeks and Persians have been boiled down to the existential political conflicts. This is largely due to the limited sources available. The majority of them come from the Greek side and therefore reflect Greek perspectives. Persian sources, meanwhile, offer very little useful material regarding Greco-Persian relations and the situation of the Greeks under Achaemenid rule; this indirectly reflects the relative insignificance of the Greek polities on the western periphery of the empire for the Achaemenids. The major sources available to us are all Greek literary texts – ranging from Aeschylus’ tragedy *The Persians* (472 BCE) to histories such as those of Herodotus and Xenophon, and on to texts whose content and significance are still the subject of much controversy, such as Ctesias’ *Persica*.

Sources like these always contain a wide variety of information, but they must be dealt with carefully. Even Herodotus’ *Histories*, which at first glance deal with the great conflict between Greeks and Persians from about 500–479 BCE and the history leading up to the wars, is laden with myriad interpretational

pitfalls. Herodotus' portrayal fits within his overall attempt to trace the origin of the Europe–Asia or, respectively, Greek–Barbarian dichotomy. Herodotus historicizes this in a magnificent way, going all the way back to mythical times, but his account is nonetheless only a construction of the fifth century BCE (Bichler 2000).

Greeks, Lydians, and Persians in Asia Minor – The Problem of the “Vassal-Tyrants”

The Greeks had always been fascinated by the impressive speed with which the Teispid Cyrus of Anshan was able to overthrow Astyages, the last ruler of the Median confederation, while simultaneously launching an expansion campaign which even Babylonia could no longer resist in 539 BCE. Even before the fall of the last Babylonian ruler, Nabonid, Cyrus had already redrawn the political map of western Asia Minor – with significant consequences for the Greek *poleis* on the western coast and on the off-shore islands. He was able to fend off an attack by the Lydian king Croesus, who was most likely killed as the Persians pillaged his capital city of Sardis in 541 (?) BCE. As the Persians did with all other annexed territories, they took control of all of Lydia and integrated it into the structure of their own empire, complete with its administration (Jacobs 1994: pp. 89–92). The heart of Lydia – Sardis – thus became the seat of a governor appointed by the Great King. More importantly, however, the Ionian, Aeolian, and Dorian cities in western Asia Minor fell under Persian rule. Herodotus takes up one of his central motifs when he comments that the Greeks were at first “free” (*eleutheroi*) and had to pay tribute for the first time under Croesus (Hdt. 1.6). Only the Milesians were prepared to come to an understanding with the Persians and were thus able to arrange to receive the same conditions that they had enjoyed under Croesus; this, in turn, guaranteed Miletus a privileged status in the period that followed (Hdt. 1.141).

However, when the Lydian Pactyes, whom Cyrus had appointed to collect the tributes, revolted against the Persians, the Ionians immediately joined his side. It took a great effort on the part of the Median commanders Mazares and Harpagus to put down the revolt and at the same time take each individual Greek city for the Persians while still conquering the territories of Caria and Lycia (Hdt. 1.141–176). Not all Greeks wanted to suffer this fate; some of them voluntarily left their city and resettled elsewhere. The rest surrendered to Persian control, except the Milesians who made a treaty with Cyrus. “Thus was Ionia for the second time enslaved” (Hdt. 1.169).

While it must have been relatively easy for the Persians to integrate the successively conquered territorial realms as they could rely on the existing governmental and administrative structures, they met with much larger problems when it came to the Greek cities because these lacked territorial and political unity (Walter 1993: pp. 273–278). Each *polis* was an independent polity in which individual aristocrats competed for political influence and had to contend with the *démos*, so it generally could not be assumed that there were any stable political conditions. In light of these rather precarious circumstances, the Persians attempted to gain access to the *poleis* by supporting individual aristocrats which they had turned into their own contact persons by ensuring their personal loyalty (this was especially important for the smooth turnover of the tributes). These aristocrats appear as “tyrants” in the Greek sources (e.g. Hdt. 4.137–138) and are often referred to in scholarship as “vassal-tyrants,” but this generalization is not entirely unproblematic. In fact, the Persians did not at all employ “tyrants” of their choosing in all *poleis* but rather they often only helped individual aristocrats gain control. This was often initiated by the aristocrats themselves (e.g. Syloson of Samos, Hdt. 3.140–149). For the Persians, it was not a matter of a systematic “toppling of the constitution” in the Greek *poleis* because, for the most part, they sought to exert influence only in *stasis* situations. The term “vassal-tyrant” can really be used only in reference to a few individual cases (e.g. Aeaces of Samos: Hdt. 6.22–25). Generally speaking, however, the Greek cities were mostly left alone as long as they regularly paid their tributes and were willing to provide military service. Nevertheless, the Persians did not shy away from energetically intervening when they saw a danger to their own rule: The Samian tyrant Polycrates (c. 538/37–522 BCE), after conquering and plundering around the sea with his powerful naval fleet, left his former ally, the Egyptian pharaoh Amasis (570–526 BCE), and supported the Persian campaign against Egypt. The Persians, however, were suspicious of his activities; their governor in Sardis, Oroetes, crucified him (Hdt. 3.125).

Not only the example of Samos makes it clear that supporting local aristocrats did not provide any kind of long-term security for Persian rule. More than any other, the glamorous figure of the tyrant Histiaeus of Miletus (Kienast 1994), who was quite obviously trying to constantly increase his own sphere of power independent of that of the Persians, reveals the instability of the political situations in the Greek *poleis* and the resultant problems facing the Persians. Herodotus provides a novel-like account of the adventures of Histiaeus, which can possibly be traced back to an anti-Histiaeus biographical tradition that existed at the time (Murray 1988: p. 486). In Herodotus’ *Histories*, Histiaeus appears as the sole initiator of the Ionian Revolt, but the link between the revolt and the Histiaeus complex might be an invention on the part of the historian (Walter 1993: p. 266).

The Ionian Revolt

Under the reign of Darius I the Achaemenid Empire expanded to the west. Darius' gaze increasingly focused on the islands along the coast of Asia Minor, and he also took over Thrace and transformed the Macedonian king into his vassal; from this point onward, Greece found itself practically encircled by the Persians. Darius' campaign against the "Scythians" (in the lower Danube area) around 513 BCE, however, yielded no great gains. At the time, Histiaeus was one of the commanders of the Persian's Greek military contingents and he saved a bridge over the Danube from being destroyed, against the will of the Athenian Miltiades, thereby securing the retreat of the Great King (Hdt. 4.137; 4.141). Darius rewarded Histiaeus by giving him control of Myrcinus in Thrace, but shortly thereafter called him back to his court at Susa to be an advisor and in order to be better able to keep Histiaeus under control (Hdt. 5.11; 5.23–24). It was from Susa that Histiaeus called on his "deputy" (*epítropos*, Hdt. 5.106.1) in Miletus, his son-in-law and cousin Aristagoras, to revolt against the Persians.

Aristagoras, however, had enough reasons of his own for defecting from the Persians: An unfortunate venture against the island *polis* of Naxos – for which he had received a great deal of support from Darius' brother, Artaphernes, who had resided in Sardis as Satrap of Lydia from the 510s BCE onward – had failed. This had not only resulted in a financial crisis for Aristagoras but also weakened his position in Miletus and discredited him in the eyes of Artaphernes. The only thing left for the Milesian tyrant was to take the bull by the horns: He officially resigned as tyrant, proclaimed *isonomía* (Hdt. 5.37.2), and ensured that Persian-friendly tyrants in other Ionian cities were either exiled or – in exceptional cases (Mytilene) – killed (Hdt. 5.38; 6.9). The Ionians now commissioned Aristagoras to try to rustle up support for the revolt on the Greek mainland. The Spartans declined, the Athenians sent only 20 penteconters, the Eretrians five. The Ionians were not completely on their own as they were joined by the Carians as well as the Cypriot *poleis* (except Amathus). The revolt expanded quickly: Sardis was taken in 498 BCE, and the Ionians celebrated victory at the Hellespont (Hdt. 5.103–104). But upon hearing news of further Persian forces, panic broke out among the Greeks who were defeated at Ephesus, leading the Athenians to withdraw their ships (Hdt. 5.103). Nonetheless, it still took the Persians several years to put down the revolt. After recapturing Cyprus in 497 BCE, and victories on the Hellespont, the Persians were hit by severe setbacks in Caria even though the Greek forces suffered from lack of a clear strategy and a unified command. Aristagoras fled to Myrcinus in 497 BCE where he was killed in a battle with the resident Thracians. Histiaeus had himself sent to Ionia in 496 BCE to end the conflict, but he never managed to set foot back on his old stomping ground. He fell

under the control of Artaphernes in 493 BCE who had him killed and then sent his head to Darius in Susa. The Great King ordered his head to be honorably buried (Hdt. 6.26–30).

By this point, the revolt in Asia Minor had already fallen apart. In 496 BCE, the Greeks had been defeated by Persian forces in a naval battle near the island of Lade (to the west of Miletus). Yet again, this defeat revealed the effects of lack of a clear leadership structure (although the assembly of the Ionian League at least tried to coordinate the war effort, Kienast 2002: pp. 16–17), as well as internal dissension. The most Samians had withdrawn from the battle (Lateiner 1982: pp. 151–160), and others then followed (Hdt. 6.14). However, it would be much too one-sided to attribute the Greek defeat at Lade only to the failure of the revolting forces. The Persians had in fact had their own powerful fleet ever since they had taken Cyprus and the Phoenicians had fallen under the rule of Cambyses, a fleet that was well in a position to stand up against the 353 Greek ships at the battle of Lade.

The Greek defeat at sea was followed by the destruction of Miletus in 494 BCE. The Athenian poet Phrynichus turned this story into tragedy as the *Capture of Miletus* (*Miletou Halosis*). However, as these events were embarrassing for the Athenians who had withdrawn their 20 ships, Phrynichus was sentenced to pay a fine of 1000 drachmas and his drama was banned from the stage (Hdt. 6.21).

The events of the Ionian Revolt are, in fact, key to any discussion of Persian rule in western Asia Minor, especially as they ideally exemplify many fundamental issues. That said, however, there is still the problem of the available sources. For example, Herodotus, about whose sources there has been much speculation, presents the revolt under the banner of a Greek struggle for freedom against Persian oppressors and the tyrants whom they supported (see Hdt. 6.32). But such interpretative categories first developed in the course of the fifth century BCE and were then applied to earlier events. Furthermore, there has also been much debate about the origins of the Ionian Revolt. Some scholars assumed that the Greeks were primarily motivated by economic reasons to rise up against the Persians (Lateiner 1982: pp. 136–137; Wallinga 1984; Murray 1988: pp. 477–478). It must be said, however, that nothing initially changed in the structural organization of Asia Minor under Persian rule and archeological findings have not verified an economic decline in Ionia, but rather the opposite (Miletus, see Hdt. 5.28; Georges 2000; Marek 2010: p. 191; for an assessment, Briant 2002: pp. 149–150). There remains a political interpretation of the revolt, but care must be taken here as well. In Miletus, Aristagoras had simply become entangled in a hopeless situation that led to a local *stasis* which then forced him to act (Walter 1993: p. 277). It can also be assumed that widespread dissatisfaction

existed in other *poleis* as well, so that the residents willingly took advantage of the opportunity to rid themselves of their tyrants. For certain, however, this would not yet have been “marketed” as a struggle for freedom around 500 BCE. Instead, the respective concrete situations in and between the Greek *poleis* presumably played a decisive role; if the main purpose had really only been to get rid of the Persians (see, e.g., Kienast 2002: p. 19) then the crisis period at the beginning of Darius’ reign in 522–520 BCE would have been a much more advantageous time to revolt.

The Reorganization of Persian Rule After the Ionian Revolt and the Problem of Darius I’s Reforms

The Ionian Revolt is also quite significant when looking concretely at how Persian rule was organized because following the destruction of Miletus, the victors were forced to reconsolidate their earlier position. Most of the male Milesians were killed, and the women and children were enslaved – the usual fate of captured cities in antiquity. Some of the survivors were deported and resettled on the Tigris river. According to Herodotus (6.19), the shrine of Apollo in Didyma near Miletus went up in flames, but there is no archaeological evidence to this effect. The Persians reconquered all of the Greek cities and punished them with similar severity (see Hdt. 6.9; 6.32). The geographer and historian Hecataeus, who had tried to convince Aristagoras not to revolt against the Persians (see 5.36), supposedly pled with the Persians to take a moderate course of action against the Ionian cities (Diod. Sic. 10.25.4).

Herodotus comments that the measures Artaphernes implemented in 493 BCE brought peace to the Ionians (Hdt. 6.42.2). The governor contractually obligated the *poleis* to resolve any future conflicts with each other amicably. Thus, the Persians continued their strategy of only trying to exercise control over the Greek *poleis* rather than employing a system of direct rule; social structures such as economic, religious, and cultural traditions were thereby left untouched for the most part. Furthermore, Artaphernes had the territories of the *poleis* measured exactly and then used the results to calculate the tributes; he came to the result that there was no need for raising the tributes following the Ionian Revolt. It is also quite possible that the assessments made by the Persians in this process later formed the basis for the tribute system of the Delian League (Hdt. 6.42; Wallinga 1989; Briant 2002: p. 394).

In the spring of 492 BCE, the Persian military commander Mardonius arrived on the scene to continue with the restoration work that Artaphernes had begun. According to Herodotus, Mardonius deposed the tyrants in the

Ionian *poleis* and set up “democracies” in their place (Hdt. 6.43). Behind what at first appears to be a rather confusing assertion, this was in fact really a kind of assurance from the Great King that the Persians would refrain from intervening in the internal structures of the polities, or rather, that the polities retained their internal autonomy. In fact, however, Herodotus’ claim was only partially true. Several of the *poleis* were again ruled by tyrants. Moreover, Persian garrisons were stationed here and there.

It is still difficult to decipher whether these measures taken to reorganize Achaemenid rule along the western coast of Asia Minor were related to the so-called reforms undertaken by Darius. In all probability, Darius’ primary goal was to define a set scale for the tributes due, especially because the financing of the fleet established under Cambyses had led to a short-term overload on his resources (Wallinga 1984, 1987). The organizational measures taken by Artaphernes after the Ionian Revolt could indeed be considered as a reflection of these more general reforms under Darius (Briant 2002: pp. 69–70; Wiesehöfer 2009: p. 172).

As a rule, Artaphernes and the Achaemenid governors in Asia Minor who followed are referred to as satraps, but there is a variety of problems associated with this label (see Jacobs 1994: pp. 118–146; Marek 2010: pp. 205–209; Briant 2002). The title “satrap” first appears in the Bīsūtūn Inscription authored by Darius I in reference to two deputies of the Great King in Bactria and Arachosia (DB III 14; DB III 56); in Greek sources (*satrapeie* for the first time in Hdt. 3.89.1, *satrápes* from Xenophon onward) the term is not used uniformly, as *epítropos* or *hýparchos* are also used and these could also refer to officials at ranks below a governor. The Persians distinguished principally between three kinds of Ionians (“Yauna”), namely those of the lowlands, the islands, and the “shield-bearing” (?) – albeit the Carians are also noted in their texts (Rollinger 2006: pp. 132–133). The administrative center for western Asia Minor remained the old Lydian royal seat of Sardis until the fourth century BCE (Wiesehöfer 2009: p. 171). The satrap of Sardis, under whom the Yauna fell as a tribute-paying group, kept an eye over an area of varying size that during some phases even included part of Cappadocia. In the fourth century BCE (Debord 1999: pp. 116–157), he primarily competed with the satraps of Phrygia on the Hellespont (seat: Dascylium). Meanwhile, during the first half of the fourth century BCE, the Carians under the native dynasty of the Hecatomnids formed their own satrapy (Marek 2010: pp. 208–209). From the end of the fifth century BCE onward, the satrap of Sardis also carried the title *káranos* as commander of the Persian troops in western and central Asia Minor and was outfitted with special authority. The satraps could, in turn, appoint their own officials or representatives, such as the “vassal-tyrants” mentioned, including local dynastic rulers and even women (Mania: Xen. Hell. 3.1.10–14; Debord 1999).

The So-called Persian Wars and the Delian League

The Ionian Revolt also had consequences for the Persians. Their rule in the North Aegean region had eroded. Although Herodotus claims that the aim of the Persian's so-called Mardonius campaign in the north Aegean area in 492 BCE was to punish Athens and Eretria for their support of the rebellion (Hdt. 6.43.4), their real intention was presumably to reestablish their control over Thrace and Macedon (Zahrnt 1992). From the perspective of the Greeks after 480/79 BCE, this campaign must already have appeared to be part of a much larger attempt to conquer Greece as a whole. Herodotus did not at all doubt that this was indeed part of Darius' master plan (Hdt. 3.134–138; 5.2; 5.31–32; 5.105; 6.94).

The fact that the Persians continued to have their eye on Greece even after the end of the Mardonius campaign was a result of the fatal intervention of Athens and Eretria in the Ionian Revolt. From the Persian perspective, it was above all Athens that was in need of discipline: In 507/06 BCE, as the Athenians felt threatened by the Spartans, they had appealed to the Persians to form an alliance and their messengers gave them earth and water as a sign of subservience. Although the Athenian assembly never ratified this act, and the messengers were subjected to severe reproaches upon their return, Athens was nonetheless considered by the Persians to be a city belonging to the Great King (Hdt. 5.73; see also 8.142; Berthold 2002), and the Athenian involvement in the Ionian Revolt was a matter of a rebellious subservient polity. The goal of the first direct Persian attack on Greece was thus to punish Athens and Eretria. Contingents from the Greek *poleis* in Asia Minor were part of this campaign that was commanded by Datis the Mede and Artaphernes, the son of the like-named satrap of Sardis, in 490 BCE. While the Persians successfully took some of the islands of the Cyclades (to secure the Persian sphere of influence) and Eretria, the Athenians under their *strategós* Miltiades, who had been forced to give up his own area of rule on the Thracian Chersonese to the Persians (Hdt. 6.41), defeated the Persians at the Battle of Marathon. This was a key turning point for the Athenians, because their polity, which had been fundamentally reorganized by the reforms of Cleisthenes, had now successfully passed its first major test. Accordingly, as early as the fifth century BCE, this glorious victory at Marathon developed into one of the central myths surrounding the foundation of Athenian democracy (Hölkeskamp 2001; Jung 2006).

Darius' son and successor, Xerxes, however, had much greater plans for Greece. Although it is not fully clear whether the campaigns launched by Xerxes were intended to fully conquer Greece or were merely an attempt to force the Greek *poleis* to recognize Persian supremacy, the massive amount of armaments clearly indicates that Xerxes' goal was to find a long-term solution

for the Greek problem. While some Greek *poleis* and *ethne* (such as the Thebans and the Thessalians) allied with the Persians, and others remained neutral (Argos) or bided their time (Delphi), about 30 *poleis* joined together in the “Hellenic League” to defend themselves against the Persians (Baltrusch 1994: pp. 30–51). With the help of this alliance, officially under the leadership of Sparta, the Persians were defeated at the battles of Salamis (480 BCE) and Plataeae (479 BCE) and forced to retreat for good.

At Themistocles’ initiative, the Athenians had massively built up their fleet of triremes prior to the invasion of Xerxes, which paid off in the victory at Salamis. Athens thus became the leading power in the Aegean thanks to its fleet, especially after the Persian fleet was destroyed near the Mycale promontory in 479 BCE. The Ionian island *poleis* who had supported the struggle against the Persians had also already been integrated into the Hellenic League at the so-called conference of Samos (Hdt. 9.106). This newly-won freedom of movement on the sea made it possible for the Greeks to go on the offensive against the Persians, sieging the Persian garrison stationed in Sestos (on the Thracian Chersonese); expeditions against the Persians on Cyprus and in Byzantium followed in 478 BCE (Hdt. 9.114–118; Thuc. 1.94). Principal differences of opinion between Sparta and Athens over the further course of the Greeks’ endeavors, however, led the Spartans to withdraw from active warfare in 478/77 BCE. The Athenians, in turn, formed their own war alliance intended to protect the Ionians against the Persians – the Delian League. The goal of this alliance was to continue the war against the Persians in order to take revenge and to seize booty (Thuc. 1.96). It was comprised of free, independent members organized under Athenian leadership (initially most of the Greek *poleis* on the Hellespont, Aeolian, and Ionian coastal cities from Sigeion to Teichioussa, *poleis* on the islands of the Aegean and most likely Byzantium) that either provided ships for battle or paid tribute to the alliance whose treasury had been set up in Delos. These members were then guaranteed protection against Persian invasions (Baltrusch 1994: pp. 52–64). The Athenians themselves most likely saw the main purpose of this naval alliance as creating a kind of safety belt to protect against further Persian attacks. In the years that followed, this alliance grew rapidly, but the Athenians basically turned it into their own personal instrument of power (*arché*). Any attempts made to leave the league were violently crushed (Thuc. 1.96–98). During its first phase, the naval alliance was primarily under the influence of the Athenian Cimon, the son of Miltiades, who led the alliance’s first campaigns. In fact, his entire family completely identified itself with the war against the Persians (see the portrayal of the Battle of Marathon in the *stoá poikíle* on the Athenian *agorá*; Hölkeskamp 2001; Jung 2006). It was also under the leadership of Cimon in 466/65 BCE that during the double victory at the Battle of the

Eurymedon (Pamphylia, near modern-day Manavgat) the alliance destroyed a Phoenician fleet with whose help the Persians wanted to reclaim their lost advantage at sea (Thuc. 1.100; Diod. Sic. 11.61.1). As a result of these events, the *poleis* in Caria and Lycia could also be persuaded to join the naval alliance.

But the tide began to turn in favor of the Persians under the reign of Artaxerxes I (465–424/23 BCE). The league, and especially Athens, suffered horrendous losses while supporting a revolt against the Persians in Egypt that ultimately failed (460–454 BCE); an attempt to pry Cyprus out of Persian control also fell flat in 450 BCE. In fact, these were the naval league's last offensive campaigns against the Persians. It still remains unclear whether a formal peace treaty was actually made in 449 BCE ("Peace of Callias") or whether the fighting was stopped by mutual agreement as an official peace treaty is only first mentioned by authors in the fourth century BCE. However, this issue is irrelevant to the end result: The Athenians and the Persians accustomed themselves to the *status quo* and the Ionian city-states initially retained their independence (Welwei 1999: pp. 96–107).

The Consequences of the Peloponnesian War – Greeks and Persians at the Beginning of the Fourth Century BCE

Toward the end of the Peloponnesian War between Athens and Sparta (431–404 BCE), the Delian League fell apart. *Poleis* in Ionia and on the Hellespont simply withdrew from the alliance in light of the rather precarious situation of the Athenians, and some dynasts and city-states in Caria and Lycia went over to the Persians. After putting down revolts that had been supported by, among others, the Athenians, Tissaphernes, the Persian satrap in Sardis and *káranos* in western Asia Minor, came to an agreement with Sparta in 412/11 BCE to support the Peloponnesians in their war against Athens. In return, Sparta recognized Persian rule over the Greeks in western Asia Minor (Thuc. 8.18; 8.37; 8.58; see also 8.5; 8.43; 8.87). A few years later, however, Tissaphernes was forced out by Cyrus the Younger, the brother of Artaxerxes II (404–359 BCE), and found himself left only with Caria and Miletus (Xen. Hell. 1.4.3). Cyrus' campaign against Babylon in 401 BCE must also be read within this context of an internal dispute among the Achaemenid leaders; Cyrus' goal was to oust Artaxerxes and take control of the Persian Empire for himself. But he fell at the Battle of Cunaxa (near Babylon), even though his army comprised mainly of Greek soldiers had won. Xenophon describes the arduous retreat of this army back to the coast of the Black Sea in his *Anabasis*. This work contains a plethora of information about the ways of life of the

Anatolian population, but it offers little in terms of the organization of Persian rule and the relationship between the Persians and the locals (Lane Fox 2004).

Following the failure of Cyrus' uprising, Tissaphernes returned to his old position as *káranos* (Diod. Sic. 14.26.4). He was then confronted by his earlier allies, the Spartans, who had launched offensives against the Persians in 399 BCE, presumably aiming to once again securing the independence of the Greeks of Asia Minor and, in a pan-Hellenic spirit, to push out the Persians (Xen. Hell. 3.4.2–6). From 396 BCE onward, the Spartan king Agesilaus II himself appeared at the battlefield in Asia Minor where he launched several campaigns into the interior through 394 BCE. The Persians, in turn, were able to win over the Athenian Conon as an adept commander for their fleet and to finance a coalition in Greece – comprised of Argos, Athens, Thebes, and Corinth – that effectively pulled Sparta into the Corinthian War (395–387 BCE). In 394 BCE, Conon was able to destroy the Spartan fleet with Persian ships at the Battle of Cnidus, forcing the Spartans to retreat out of Asia Minor (Cartledge 1987; Briant 2002: pp. 637–645; Buckler 2003). The so-called “King’s Peace” (Peace of Antalcidas), which the Persians had negotiated between Sparta and its opponents in 387/86 BCE, ended the ongoing battle to fill the power vacuum left behind by the Delian League following the Athenian defeat suffered at the hands of Sparta in 404 BCE. This treaty secured Persian possession of the Greek cities in Asia Minor, as well as the islands of Klazomenai and Cyprus. The remaining Greek settlements, apart from those in Athenian possession (Lemnos, Imbros, and Skyros), were to stay independent (Xen. Hell. 5.1.31). Ultimately, the Achaemenids successfully managed to keep hold of the position that they had won in Asia Minor in the second half of the sixth century BCE. At the same time, they also proved to be an indispensable factor affecting the politics of the Greek polities that continued to remain independent.

Despite the agreements that were made in the King’s Peace, the Persians remained the archenemy in the eyes of the Greeks. The Greek *poleis* in Asia Minor were considered to be oppressed polities whose liberation had been styled into matter of pan-Hellenic interest. At the same time, the Greeks wanted to exact revenge for the destruction that had occurred over the course of Xerxes’ campaigns. These kinds of ideologemes that were propagated by prominent intellectuals such as the Athenian Isocrates, however, did not have the power to put an end to the lively exchange taking place between Greeks and Persians. In the end, it was left to the Macedonian King Philipp II to dare to launch the long-desired great march against the Persians, but it was ultimately his son, Alexander, who finally carried through on this promise.

FURTHER READING

For an excellent overview of the problem of the available sources and the scholarly tradition that grew out of the Greek sources, see Wieshöfer (2009, with additional literature). The standard reference for the history of Asia Minor in antiquity is now Marek (2010), and for the fourth century BCE, Debord (1999). The main reference work on the emergence, establishment, and organization of Persian rule over the Greek city-states is Briant (2002); Balcer (1995) and Boardman

et al. (1988) also provide good overviews, while a comprehensive, problem-oriented account can be found in Cawkwell (2005).

The seminal works on the Ionian Revolt are the studies by Tozzi (1978), Murray (1988), Walter (1993), and Georges (2000). The best overview of the reforms of Darius I can be found in Briant (2002). Very good accounts of the Greco-Persian Wars 490–479 BCE have been published by Balcer (1995), Lazenby (1993; predominantly military history), and Welwei (2011).

The history of the fifth century BCE and the Delian League has been dealt with by Hornblower (2011) and Welwei (1999 and 2011); for a focus on the Ionians in the fifth century BCE, see Heinrichs (1989). To get a good start for the fourth century BCE, refer to Cartledge (1987), Debord (1999), Buckler (2003), and Tiersch (2016).

CHAPTER 46

Macedonia

Michael Zahrnt

Without the work of Herodotus we would know hardly anything about Macedonia under Persian rule (cf. Zahrnt 2011 on Herodotus and the Macedonian kings). Even the answer to the question as to whether this rule lasted for more than three decades or for only about 13 years depends on our interpretation of Herodotus' story of the first encounter between the two kingdoms (5.17–21).

According to this author, King Darius, after his unsuccessful campaign against the Scythians (c. 513/12 BCE), had left the general Megabazus with allegedly 80 000 soldiers on European soil (4.143–144). Megabazus had marched along the Thracian south coast and subjugated all cities and tribes in that area (5.1–2, 10); at the close of his campaign he had conquered the Paeonians, who lived around the lower Strymon and had deported some of their tribes to Asia Minor (5.14–15). From the Strymon valley Megabazus had sent an embassy to Macedonia to demand the submission of king Amyntas. Incidentally, in those days the kingdom of Macedonia with its capital at modern Vergina was still relatively small; with the districts of Pieria and Bottiaea it consisted of the coastal area around the Thermaic Gulf, which at that time extended far to the west into the interior, and reached in the south to the mouth of the Peneus and in the north probably already to the Axios.

The Macedonian king gave the Persian envoys earth and water, the tokens of submission under the king, and invited them to a banquet. After the dinner the Persians insisted on the presence of the female members of the court and very soon began to act improperly toward them, whereupon Alexander,

Amyntas' son, asked his father to go to bed and sent the ladies away – allegedly to make their toilet; instead of them he brought into the banquet-hall young men in disguise, who killed the Persians at their first overtures. Also the entourage, the coaches, and all the equipment were eliminated. When a little later the Persians searched for their embassy which seemed to have disappeared completely from the earth, Alexander managed to appease them by giving a lot of money to the search party and his sister Gygaea in marriage to their leader, Bubares. In the winter of 480/79 BCE Amyntas, the son of Bubares and Gygaea, is mentioned as the ruler of a town in Asia Minor (Hdt. 8.136.1), so that we can date the marriage to the last decade of the sixth century BCE.

The story of the murder of the envoys is typically Herodotean and at the same time highly suspect. Today most scholars consider it as a later fabrication;¹ without any doubt the story was put about after the Persians' defeat at Plataea and their retreat from Europe, and it was meant to put a different gloss on the period, when Alexander I, who in later years wanted to be regarded as a friend and patron of the Greeks, was in reality a subject of the Persian king and obliged to fight under his command. In fact, Alexander was able to disguise, at least partly, the extent to which he had supported Xerxes during his campaign against Greece, and his story of the murder of the Persian envoys found credence with Herodotus. In addition, Alexander had to offer an exonerating explanation of the marriage of his sister to a member of the Persian ruling class. This marriage could have come about only if at the same time Macedonia had been made dependent on the Persian king. In this context it is irrelevant whether the Macedonian king had become a vassal, as many scholars believe, or whether he had been made a subject who had to pay tribute to the king.² Recently, however, not only the historicity of the assassination of the envoys has been contested but also the inference that it was meant to conceal submission to the supremacy of the king; both the submission and the marriage of Bubares and Gygaea are said to have happened about 20 years later as a result of Mardonius' campaign (to be dealt with in due course).³ The account of Herodotus does not render this suggestion plausible (nor does it unambiguously prove the opposite); there is also the question as to why an act of submission which had never been carried out should be concealed. In addition, what is the point of putting about a story that was meant to render something undone which allegedly had never happened? Therefore with the majority of scholars we should allow Macedonia's dependence on the king to begin in about 510 BCE.

Obviously Amyntas could profit from the partial deportation and ensuing weakening of the Paeonians and extend his territory across the Axios into the plain of modern Thessaloniki and as far as the ridges of the Chortiatis.⁴ After his second expulsion from Athens the tyrant Pisistratus had spent some time in the neighborhood of this area, and when his son, Hippias, had to leave his

country as well, Amyntas offered him the district of Anthemus which lay southeast of Thessaloniki (Hdt. 5.94.1). A few years later Amyntas died and his son, Alexander, ascended to the throne. Immediately after his account of the assassination of the Persian envoys, Hdt. 5.22 tells us that Alexander wanted to compete in the Olympic Games, was admitted only after he had proved his Hellenic descent, took part in the furlong race, and ran a dead heat for first place (whatever that means). The event is undated, and scholars vacillate in placing it between 508 and 476 BCE, but as a sprinter Alexander might have had his best chances in 496 BCE, and historical considerations point to his appearance in Olympia occurring in this year (Zahrnt 2011: p. 766).

Alexander's admission to one of the Greek national games, particularly as the first representative of his country, is at the same time an indication that in those years the Macedonians had slipped out of the king's grasp. This was a by-product of the Ionian Revolt (see Chapter 45 The Greek World), which was not confined to the west coast of Asia Minor and Cyprus but had also interrupted contact with the Persian vassals and subjects on the Balkan peninsula.⁵ Actually the hints in Herodotus' work of a temporary weakening or even collapse of the Persian rule concern only the Thracian area. In the case of Macedonia, our author could not have spoken at all about an end of the Persian overlordship since, owing to the alleged assassination of the Persian envoys, the Macedonians could never have become subjects of the king.

In fact, the Macedonians might only have made the most of the difficulties of the Persians but had not openly offered opposition to the king. So Alexander kept his throne when in 492 BCE Darius sent his son-in-law, Mardonius, to reconquer those territories on European soil which had been lost during the Ionian Revolt (Hdt. 6.43–45). As far as Macedonia is concerned, we are told only that the Persian "land army added the Macedonians to the slaves that they had already" and that by night the Thracian Brygi attacked the Persians who encamped in Macedonia, killing many soldiers and even wounding the general, but that Mardonius did not depart before he had also subjugated the Brygi. Neither can we identify and locate these Brygi, nor do we know where the attack occurred and how far Mardonius had marched into Macedonia. Herodotus eventually stresses the huge losses which the Brygi had inflicted on the army and which the fleet had suffered when it was shipwrecked at the Athos. According to him, the campaign was a total failure, yet at the beginning of book seven he has the same Mardonius speaking about his successful advance up to Macedonia.⁶

Herodotus' report does not indicate whether and to what extent the status of Macedonia had changed in comparison with what it was at the time of Amyntas.⁷ Of course, this question is irrelevant for those scholars who claim that both the Persian rule of Macedonia, however it was organized, and the marriage between Bubares and Gygaia began only with the expedition of

Mardonius.⁸ Things are different, if Amyntas had already given the Persians earth and water and Mardonius had reconquered the kingdom. In this case many scholars assume that this expedition had just restored the subservience of Macedonia or do not say anything about the character of the Persian sovereignty.⁹ Some scholars even believe that the Persian rule was tightened but cannot say what it now looked like.¹⁰ This is not surprising: Herodotus, the only author who speaks about Mardonius' expedition and its consequences, does not give any details, and relevant Achaemenid evidence does not exist. Even the name of these vassals or subjects is disputed. The Yaunā takabarā which, beginning with the tomb of Darius, are found in reliefs or inscriptions are sometimes – with more or less confidence – identified with the Macedonians.¹¹ Recently, however, Rollinger (2006) has convincingly shown that this assumption is highly dubious. Even an unambiguous identification of the Yaunā takabarā would not help us, since it is well known that these sources record not satrapies but conquered peoples whom the king wished to name specifically (Sancisi-Weerdenburg 2001: p. 331). No Persian satrap residing in Macedonia is attested; rather, the land was ruled by its kings, first by Amyntas, later by Alexander, who had obviously surrendered voluntarily to Mardonius.¹² In contrast to the Thracian coastal area there seem to have been no Persian garrisons on Macedonian soil. Such military bases might even have been unnecessary as long as the Macedonian king guaranteed the safety of Persian rule in the area around the Thermaic Gulf, whereas Thrace was split up into numerous tribes and did not possess a central authority. While in Thrace the crossings of the rivers Hebrus and Strymon were safeguarded by the Persian garrisons of Doriscus and Eion, in Macedonia it was the king who had firm control of the mouth of the Axios. This was very important for the Persian king, as became evident during Xerxes' invasion of Greece and its preliminaries.

This event, which has been described by Herodotus in great detail (three out of nine books) and dealt with by many scholars, was at the same time the last act of Persian rule in Macedonia. During the course of the preparations for this operation, supply camps were set up along the route of the planned advance, some among them in Macedonia itself (7.25.2); unlike in Thrace, Herodotus mentions no specific names for camps in Macedonia, but one of them should have been in Therme (in the area of modern Thessaloniki). Here, on instructions from Xerxes, the Persian fleet which had been sent around the Chalcidic peninsula and the land army which had marched through the interior were to meet and remain encamped until their southward departure.

The Macedonian king is not mentioned in this context but had already been active in the interest of his master (Hdt. 7.172–175.1; cf. Robertson 1976). Representatives of those Greek states which were determined to ward off the Persian attack had met on the isthmus of Corinth and decided to take up an

advanced position north of the Peneus and had dispatched troops. Some days after their arrival messengers came from Alexander and, emphasizing the immense size of the Persian army and the huge number of enemy ships, counseled them to depart. The Greeks believed that the advice was good and that the king meant well toward them and withdrew. Alexander could present himself as an honest friend of the Greeks, perhaps already in the estimation of the dispatched Greeks, in any case later in Herodotus' eyes. In fact, he had eased his sovereign's march to the south and at the same time made sure that the Persian army, to whose supply he certainly had to contribute, did not stay in his country any longer than was absolutely necessary.

When the Persian army moved off from Therme to the south it was accompanied by Macedonian soldiers (Hdt. 7.185.2); however, during the fighting of 480 BCE neither Alexander nor his Macedonians are mentioned.¹³ When, after the defeat at Salamis, Xerxes hastily returned by land to the Hellespont, he left behind the sick soldiers in Thessaly, Macedonia, and Paeonian Siris (Hdt. 8.115.1; 3). During the following winter Mardonius, who was now in supreme command, billeted his troops in Thessaly and Macedonia (Hdt. 8.126.2).

From here Mardonius sent Alexander with tempting offers to Athens in order to induce the Athenians to change sides. According to Herodotus, the Macedonian king was chosen for this job because the marriage of his sister, Gygaia, had made him a relative of the Persians and because at the same time he was a proxenos of the Athenians and had been honored by them as a benefactor (*energetes*: Hdt. 8.136.1). Many scholars attribute the granting of these titles to the fact that Alexander had supplied the Athenians with the timber which they had needed in the second half of the 480s BCE for the construction of their new fleet. I have my doubts. Why should Alexander have put at risk his position as a privileged vassal by sending material for the reinforcement of the navy into an area which was still rebellious? In addition, these exports could not have been kept secret, since in these years Alexander's brother-in-law, Bubares, supervised the digging of the canal through the neck of the Athos peninsula (Hdt. 7.22.2). Either Alexander had inherited the title of proxenos from his father, who had been a friend of the Athenian tyrants, or it had been awarded to him by the Athenians after the end of Xerxes' invasion. The way Herodotus has him speak at Athens shows clearly that he was not a close friend of the Athenians; in fact, in view of his position as a subject of the king and the presence of Persian troops in his country, he had no choice but to fulfill his task according to the interests of his overlord.

Alexander's last appearance in Herodotus' *Histories* occurs the night before the battle of Plataea (9.44–46.1). According to our author, he rode up to the camp of the Athenians and told the generals under the seal of secrecy that he was by ancient descent a Greek and did not want to see the Greeks change

their freedom for slavery. Although the sacrifices had been unfavorable, Mardonius had decided to attack at dawn. In case of the hoped victory, the Greeks should not forget that they also owed their liberation to him who had undertaken this dangerous ride for the sake of the Greeks and had protected them from being attacked unexpectedly by the barbarians. Then he disappeared in the darkness of the night. This story again is typically Herodotean and its validity cannot be checked. But this does not entitle us to accept it as true, as some scholars do.¹⁴ There is also the question as to what service the Macedonian king could actually have performed for the Greeks, who in fact eagerly wished that the Persians would begin the battle of their own accord and who certainly could not have been surprised by an unforeseen attack.

Herodotus' report clearly shows that on the one hand Alexander was indeed a loyal subject and supporter of the king in his campaign against the Greeks. On the other hand, after the war he could disseminate the version which found credence at least with Herodotus that deep in his heart he had really supported the Greeks. In contrast, we have contemporary evidence in the form of tetrobols of the Macedonian king which are dated around 480 BCE and can be connected with Xerxes' invasion and its preparations (Heinrichs and Müller 2008). On the obverse, these coins show a Macedonian horseman with a short sword which has convincingly been identified as an *akinakes*; this was one of the most outstanding decorations the king could award and attested the superior position of the recipient and his proximity to the Achaemenid dynasty. For contemporaries there could be no doubt that the Macedonian king was a faithful and highly decorated subject and assistant of his master.

It is therefore not astonishing that after his alleged night ride in the plain of Plataea, the Macedonian king does not turn up again in Herodotus' work. Not until two speeches in the Corpus Demosthenicum do we read that the king who was reigning in Macedonia at the time of the Persian invasion had destroyed the Persians on their retreat from Plataea and had completed the defeat of the king, and some years later king Philip of Macedon wrote to the Athenians, saying that his ancestor Alexander had, well before the Athenians, occupied the site of the later Amphipolis "and, as the first-fruits of the Persian captives taken there, set up a golden statue at Delphi."¹⁵ The statue is unambiguously historical and its existence and location near the big altar are attested by Herodotus (8.121.2). But this author does not know anything about an attack on the retreating Persians, although in this way the king could have proved his alleged sympathies for the Greeks. So we must assume that the dedication in Delphi was made later, and in another context, and was only in the fourth century BCE connected with Xerxes' invasion,¹⁶ perhaps under the influence of Herodotus' portrait of a friend of the Greeks sitting on the Macedonian throne. This portrait was lasting and was eventually responsible for the fact that in order to distinguish between the Alexander who had

cooperated with the Persians and the Alexander who had successfully fought against them and was later called “the Great,” the first-named of the two was given the epithet “Philhellene.”¹⁷ Hardly ever has a collaborator been so successfully rehabilitated.

NOTES

- 1 It will be sufficient to present a small selection from the past nine decades: Geyer (1930: p. 42), Castritius (1972: pp. 2–3), Errington (1981: pp. 140–143), Errington (1986: pp. 20–21), Rosen (1987: p. 31), Borza (1990: pp. 102, 112), Erbse (1992: pp. 102–104), Zahrnt (1992: p. 246), Badian (1994: pp. 113–114, 127), Sieberer (1995: pp. 258–261), Bichler (2000: pp. 299–300), Gschnitzer (2001: pp. 92–93, 94), and Scott (2005: p. 189).
- 2 Amyntas was a vassal according to e.g. Geyer (1930: p. 42), Edson (1970: p. 25), Castritius (1972: pp. 2–3), Balcer (1988: pp. 4–5), Briant (1996: p. 157), Scott (2005: p. 189), Heinrichs and Müller (2008), Olbrycht (2010: p. 343), and Mari (2011: p. 85), while in the opinion of Hammond (1979: pp. 58–59) the Macedonians had become “subjects of Persia” and Bubares was “effectively in charge of Macedonia”; on p. 60 he describes him as “governor or advisor to the governor of the satrapy.”
- 3 For the first time by Errington (1981: pp. 139–143), who was followed among others by Borza (1990: pp. 102–105), Erbse (1992: pp. 99–104), and Sieberer (1995: pp. 258–260).
- 4 Cf. on the seizure of the land along the western bank of the Axios and on the advance as far as the plain of Thessaloniki Hammond (1979: p. 59), Zahrnt (1984: pp. 342–344, 358–361), and Errington (1986: pp. 17–18).
- 5 While most scholars from Geyer (1930: p. 43) to Sprawski (2010: p. 135) think that the Macedonians had thrown off the Persian rule, or at least taken advantage of the situation in Thrace, some like Hammond (1979: p. 60, cp. 99) assert that “the Thracians and the Macedones made no move.”
- 6 Hdt. 7.9 a 2. b 2; cf. also 7.108.1, that Megabazus and later Mardonius had subjugated the whole country up to Thessaly. Cf. on Mardonius’ expedition and its objective Zahrnt (1992: pp. 238–244), Briant (1996: p. 169), and Scott (2005: pp. 185–191; 197–203).
- 7 For general ideas about the status of Macedonia under Persian rule cf. recently Briant (1996: p. 169), Scott (2005: pp. 189–190, 198), Tripodi (2007: pp. 76–77, 83–85), Sarakinski (2010: pp. 104–105), and Sprawski (2010: pp. 137–138).

- 8 Cf. above note 4; also Briant (1996: p. 157), and Sprawski (2010: pp. 136–137), do not rule out the possibility that the conquest of Macedonia and the marriage are to be connected only with the expedition of Mardonius.
- 9 So e.g. Rosen (1987: pp. 30–31), who, however, connects the marriage with the expedition of Mardonius; Badian (1996: p. 116) and Olbrycht (2010: p. 344).
- 10 So e.g. Castritius (1972: p. 11), Balcer (1988: pp. 6. 13), and Archibald (1998: pp. 83–84).
- 11 E.g. Archibald (1998: pp. 83–84), Sancisi-Weerdenburg (2001: p. 329), Olbrycht (2010: pp. 343–344), and Sarakinski (2010: pp. 101–103).
- 12 Cf. e.g. Edson (1970: p. 25), Heinrichs and Müller (2008: pp. 289–291), and Sarakinski (2010: pp. 104–105).
- 13 Macedonians appear only in Boeotia, having been sent on ahead by Alexander in order to safeguard the cities and to show to Xerxes that the Boeotians were on the Persian side (Hdt. 8.34).
- 14 Cf. e.g. Geyer (1930: p. 45), Edson (1970: p. 26), Erbse (1992: p. 101), Badian (1996: pp. 109–118), and Bowie (2007: p. 224).
- 15 Dem. 23.200; [Dem.] 13.24 (in both cases the king is erroneously called Perdiccas); 12.21.
- 16 Cf. Hammond (1979: pp. 101–102), who correctly emphasizes that Alexander’s “forces would have been entirely adequate for the purpose” and who dates the temporary occupation of Ennea Hodoi to the years between 478 and 476/5 BCE; whereas Mari (2002: pp. 37–39) speaks of a fiction, which is to be dated into the fourth century BCE; cf. also Sprawski (2010: pp. 139–140).
- 17 According to Hammond (1979: p. 101 note 3): “it was a characteristic of the Hellenistic period to add an epithet to homonymous kings”; cf. Errington (1986: p. 21) and Sprawski (2010: p. 143); it is first attested in Dio Chrys. 2.33.

Deals with Herodotus' account of the history of Macedonia in the age of the Persian Wars and its assessment in modern scholarship.

CHAPTER 47

Thrace

Dilyana Boteva-Boyanova

So far, indisputable Persian evidence of Achaemenid rule in European Thrace is missing. Despite the attempts at identifying the “Skudrians” in the royal lists of peoples/countries and in the Fortification texts as Thracians (Szemerényi 1980: p. 26; Tatscheva 1992; Balcer 1995: p. 121; Briant 2002: p. 176) or “mainly Thracians” (Fol and Hammond 1988: p. 247), their ethnic identity remains “a thorny problem” (Henkelmann and Stolper 2009: p. 288). Scholarship has produced several further identifications – Thracians and Macedonians (Kent 1943: p. 306¹), Paeonians (Pajakowski 1983: pp. 252–253), and others² – none of which has clarified the issue satisfactorily. The “Skudrian question” becomes even more complicated when Achaemenid reliefs are taken into consideration because “the representatives of Skudra (or those we have identified as such) do not always correspond with each other” (Sarakinski 2010: p. 100). Clearly, for indisputable Persian evidence on Achaemenid rule in Thrace, historians depend on future archeological finds and epigraphic studies.

In the meantime the issue could be treated following Greek (Thucydides 1.98; 1.128; Diodorus 11.44; 11.60; Plutarch, Cimon; Pausanias 3.4; 8.8) and to a lesser extent Roman (Cornelius Nepos) authors. Among them Herodotus is of course the main source: with his reports at hand, often contradictory ideas have been reasoned in modern literature (e.g. Tuplin 2003: pp. 390–391). Due to the limited space, it is impossible to present here the different views with all the pros and cons. However, according to the classical sources, several stages of Persian rule in Thrace seem to be recognizable, though they are defined differently (e.g. Balcer 1988: pp. 8–15 and Vasilev 2015).

Achievements in European Thrace Predating Darius' Scythian Campaign

Evidence suggests Persian overseas military activity prior to this expedition. It resulted in establishing relations with Miltiades the Younger, “a strategos and tyrant” of Thracian Chersonese, and Metrodoros, the tyrant of Prokonnesos, who participated in Darius’ undertaking. Probably c. 515 BCE the European coast of the Hellespont with its hinterland was taken under Persian control by Megabazus, being “strategos of the Hellespontian land (see however Tzvetkova 2008, pp. 292–294).”³

Darius' Scythian Campaign (513/12 BCE)

The Thracians of Salmydessos, the Scyrmiadae, and the Nipseans gave themselves up to the Great King without any struggle. The first people subdued by Darius in Europe despite their resistance were the Getae. Marching northwards the king may well have followed a route lying at a distance of approximately two days’ travel from the coast. Some detours were to be expected due either to the terrain or for strategic reasons. On his way back from the Trans-Danubian region, Darius appointed Megabazus as “strategos of Europe” (controlling not only the Hellespontian coast but also the newly subdued peoples “in Europe”) and ordered him to subject Thrace.

Megabazus' Undertakings in Thrace (c. 512–499 BCE)

He subjugated “every city and every tribe of those who lived there” (Hdt. 5.2.2), reaching the Paeonian territory in the Strymon valley. This enterprise witnessed the deportation of several Paeonian tribes’ “men, women and children” into Asia (Hdt. 5.14–15) and Histiaeus, the tyrant of Miletus, being rewarded by Darius with Myrcinos in southwestern Thrace (Delev 2007). After securing the coast and deporting the Paeonians, Megabazus arranged relations with neighbors inland. In my opinion, this was the time when relations between the Achaemenid Empire and the Odrysian kingdom in the middle Hebros valley were settled. Probably it happened, as with Amyntas’ Macedonia, by sending a Persian embassy which demanded and possibly received “earth and water”. Megabazus’ success in subduing further Thracian territories resulted in a new office, “strategos of Thrace”.

The Ionian Revolt (499–493 BCE)

The Ionian Revolt enabled Thrace to throw off Achaemenid domination. The southwestern Thracian “corner” was freed from Persian control, enabling Aristagoras to take flight to Myrcinos (Zahrnt 1992: pp. 250–252). The Royal Fort of Doriskos at the mouth of the Hebros was used by the deported Paonians as a stopover when fleeing homeward. In 493 BCE the Persian fleet had to reconquer “the Chersonese, Perinthos and the forts that lie toward Thrace, Selymbria, and Byzantion”, which indicates the scale of the Persian territorial losses. Probably the Getae also escaped from Achaemenid rule within this period.

A New Persian Offensive (493–490 BCE) and the Consequences of Marathon

The suppression of the revolt was followed by reconquering the Hellespont and a new military campaign westward, initially marshaled by Mardonius (Zahrnt 1992). While marching from the Hellespont “through Europe”, he obviously regained the Aegean cities and the Thracian tribes as far as Macedonia. Subdued also were the Thasians, the Macedonians, and “the Brygi of Thrace,” who attacked the Persian camp in Macedonia. The Thasians were ordered by Darius to destroy their walls and bring their ships to Abdera because of a false accusation that they were planning rebellion. While Persian heralds were demanding earth and water throughout Hellas, the king’s tributary coastal cities were commanded to build warships and transports for the horses for the planned invasion of Greece. The Achaemenid rule in Thrace probably remained unharmed by the disaster of Mardonius’ fleet near Mount Athos; it is very unlikely the same is true of the Battle of Marathon. If Xerxes, in 480 BCE, in his measurements differentiated between the areas east and west of the Strymon river, it was probably because he expected a threat from the latter (Kienast 1996: pp. 308–309); it could mean that the Thracian tribes between Strymon and the Thermaic Gulf started causing problems for the Persians in the years postdating Marathon.

Xerxes’ Expedition Against Greece: Preparation, Start, and Failure, Followed by Persian Retreat (484/3–478 BCE)

The Athos Canal was dug and bridges were constructed; an exploration spotted four places in Thrace where “provisions were carried from all parts of Asia.” Hotly disputed is the route followed by the three columns of Xerxes’

army after its departure from Doriskos. Probably Xerxes – with his column marching expectedly in the middle – followed a route which coincided generally with the modern road Komotini – Xanthi – Drama – Serres. The defeat at Salamis late in September 480 BCE was followed by the king’s speedy journey back to the Hellespont, charging cities and people to nourish the Persians. Several poleis in Thrace, including Potidaea and Olynthos, started an unsuccessful revolt. Disobedience was manifested also by the Paeonians of Siris and the Thracians at the Strymon headwaters (they dared to keep “the sacred chariot of Zeus,” even though Xerxes demanded it back): only on reaching Abdera was the king supposed to be safe. At Plataea, Thracians and Paeonians were still part of the Persian infantry. Following the defeat in the battle that took place there, Artabazus fled through Thrace using the shortest inland road, where “many of his army had been cut down by the Thracians” (Hdt. 9.89). In 479/8 BCE the Athenian general Xanthippus attacked Sestos and overcame the Achaemenid troops gathered there from all parts of the Chersonese; shortly afterward the Lacedaemonian general Pausanias took Byzantion from the Persians (478 BCE).

Persia and Thrace after the Founding of the Delian League (c. 477–c. 465 BCE)

The defeats of the Persians at Plataea and Mykale resulted in a Greek offensive (479/8 BCE), which gained an organizational basis with the foundation of a new institution in the Aegean – the Delian League. In Thrace, having the support of local collaborators, the Persian occupation was centered in a few strategic sites: Eion at the mouth of the Strymon (captured by Cimon in 477/6 or 476/5 BCE) and Doriskos at the mouth of the Hebros (several failed attempts to capture it are reported). In 465 BCE Persian forces are attested in the Chersonese but were driven out by Cimon. Indisputable indications of Persian rule in Thrace end here; the connections, however, continued as hinted at by numismatic finds.

Reliable and relevant evidence about whether Thrace was administrated as a satrapy or in another way is missing. Persian governors are attested in different fortresses (Mascames in Doriskos) and poleis (Ariston in Byzantion, Artayktes in Sestos, and Boges in Eion). Megabazus, however, was a strategos of a larger area with a gradually increasing territory, not necessarily organized as a satrapy.

Persian military expeditions in Thrace led to huge preparatory works, including impressive enterprises: bridging the Bosphorus and the Hellespont as well as digging the Athos Canal. The latter was accomplished by soldiers (allegedly compelled by whippings to dig) and by the inhabitants of Athos. The inland infrastructure in Thrace was considerably improved: the banks of

the Danube and Strymon (and probably other rivers) were joined by bridges; roads were cleared so that the troops might reach their destinations. Concerning the road “along which Xerxes led his army,” it is explicitly reported that “the Thracians neither break it up nor sow, but they hold it in great reverence” (Hdt. 7.115.3).

While on military campaign, the king compelled cities and tribes he encountered to feed the army and to follow it. Xerxes forced the coastal dwellers to join him on board ship and those living inland to join the infantry. During the Scythian campaign the Getae followed Darius after being subdued. We are not told whether the same happened to the Thracians who gave themselves up without any struggle, but it seems very likely. According to the classical sources, the army was organized in nations, each with its native leaders, who were participating “as slaves,” i.e. under compulsion. In Thrace, some local rulers tried to keep their independence. The king of the Bisaltae and the Crestonian country refused to submit and fled to the Rhodope mountains; his six sons, however, followed the Persian army, for which they were later severely punished by their father.

The subjected cities and nations were obliged to pay taxes as well, among them a tax on crops, which the Thasians were not paying for unknown reasons (their case is even more interesting because they were allowed to keep significant revenues from their goldmines). Shipbuilding was probably the way in which the tributary cities of the coast were paying their taxes (see Chapter 67 Taxes and Tribute).

From an economical point of view, Thrace turned for a while into a focal point of intensive trade and storing of provisions. Apart from the food supplies, transported by camels and mules, we are told about “robes” of Egyptian papyrus and Phoenician flax as raw materials for the bridges; for the people digging the canal, ground grain was frequently delivered to Athos. In this connection Herodotus mentions a meadow at the site turned into a meeting place and market. Briant (2002: p. 455) insists “that the workers purchased their rations. Perhaps they received a salary (in whatever form, silver or tokens), which they hastened to spend in the military warehouses!” Doubtless, this immense construction could have been a factor in minting the much-disputed coins of the so-called “Thraco-Macedonian tribes” (Tacheva 1992).

Several archeological finds from the Thracian lands, the silver gilt amphora from Duvanlij (Filow 1934) being the most spectacular, are similar to items or representations known from Achaemenid Persia. They are assessed differently with regard to characteristics that allow us to distinguish between original Achaemenid products, produced under Achaemenid influence in Asia Minor and imported in Thrace, and products of Thracian craftsmen influenced by royal Achaemenid art. No clue to this puzzle has been universally accepted so far (cf. Chapter 98 “Perserie”).

NOTES

- 1 Kent (1943: pp. 305–306) hesitates as to whether Skudra denotes “Thrace and Macedonia, or a part of that territory” having in mind Macedonia as indicated in his Table 3.
- 2 Some of them are summarized by Pajakowski (1983), Henkelmann and Stolper (2009), and Sarakinski (2010).
- 3 Most of the ideas presented in this very brief text are reasoned thoroughly in Boteva (2011).

CHAPTER 48

The Northern Black Sea

Gocha R. Tsetskhladze

Atossa, wife of Darius, encouraged him to achieve fame through his actions and to a course of action he was already considering: conquering the Scythians (Hdt. 3.134). As we know, primarily from Herodotus (4.83–144), Darius undertook such a campaign not just to punish the Scythians for past behavior (Hdt. 4.1): it was the Persians entering into Europe, even a conflict between the continents of Asia and Europe, a portent of which could be found in one of Cyrus' dreams (Hdt. 1.209).

Much had been written about this expedition in the past.¹ Herodotus has been studied so thoroughly that, for want of other evidence, there seemed to be nothing to add. Tuplin (2010) revisited the problem, and Hind (2011) reassessed Herodotus' information on Scythia in general, concentrating on Darius' invasion.²

We need to know whether Darius actually campaigned across the Danube; if so, how far and with what success; the scale of his achievement in Cisdanubia; and his motives (Tuplin 2010: p. 281). Nigh impossible. Problems with Herodotus' account have long been acknowledged. His Scythian *logos* overall appears chaotic and contradictory, his grasp of hydrography and distances deficient, likewise his geography of the peoples living in the vast Ukrainian steppes (Asheri et al. 2007: pp. 558–565; Tuplin 2010: pp. 283–288; Hind 2011). Doubtless his sources for Darius' expedition were scarce, probably biased, and his account needs must conform to some of the basic principles underlying all his historiography (Asheri et al. 2007: p. 564). Moreover, Book 4 of *Histories* is not just about Scythians; it is a broad account of the steppe

zone, Eurasia, and the conflict between local peoples and the dominant power of “Upper Asia,” the Medes, and Persians (Hind 2011: p. 93); and he was writing about events of 50 years past. We still debate whether he went to the Black Sea or not. He was a Greek author, critical of the Persians. We know not whether the Scythian débâcle was as serious for Darius as Herodotus alleges: “In our terms of truth and falsehood, we may at best be invited to accept a narrative as ‘poetically’ true” (Tuplin 2010: p. 303).

Clearly, Darius’ expedition took place (Hartog 1988). Our problems lie with its extent, importance for both sides, and details. Two other ancient authors, Ctesias (*Persica* F13.21) and Strabo (7.3.14), give very brief accounts: Darius with 800 000 men bridged the Bosphorus and Ister, entered Scythia, advancing for 15 days, was defeated, fled, crossed the bridges again and broke them down before his whole army had crossed, leaving 80 000 in Europe to die (Ctesias); he crossed the Ister to attack the Scythians, got stuck in the Desert of the Getae, and, facing death, “army and all,” belatedly turned back (Strabo).

Maybe these accounts, lacking detail, demonstrate that the campaign and its consequences were less monumental? What evidence is there about the consequences for Scythia and the Greek cities of the campaign, despite its failure? We do not know how trustworthy Ctesias is (as with Herodotus), but he may have been at the Achaemenid court, allowing him some access to firsthand information, notwithstanding the lapse in time since the events he describes and the fragmentary survival of his writings. Darius ordered Ariaramnes, satrap of Cappadocia, to cross over to Scythia and to take prisoners; he did so “with thirty 50-oared ships...” (Ctesias, *Persica* F13.20), in what some consider an actual event in c. 519 BCE, regarded as a precursor of/preparation for Darius’ Scythian campaign of c. 513 BCE (Koshelenko 1999; Nieling 2010: pp. 127–128). The only maritime route to Scythia was through the Cimmerian Bosphorus: Archaic-period nomadic Scythia was concentrated territorially on the steppes of the northern Caucasus, where Scythian tombs of this period, including Kelermes, are located. Scythians did not migrate to the northern Black Sea steppe lands until the early/middle fifth century BCE.³ In labeling the inhabitants of the Ukrainian steppes “Scythians,” we are seeing them through Herodotus’ eyes. Often we forget that he himself (4.6) remarks that this name was a Greek coinage – and that he lists individual tribes in this assemblage (Hdt. 4.6, 16–31, 46–47).⁴ As archeological material demonstrates, the settlements of the eighth to sixth centuries BCE on the Ukrainian steppe, often considered “Scythian,” have nothing to do with the Scythians, at this stage nomads, not sedentary, but with a people of eastern Halstatt origin (Kashuba and Levitskii 2012; Vakhtina and Kashuba 2012). Some characteristics of these eighth- to sixth-century settlements, tribal political centers, demonstrate how substantial they were and how difficult for Darius’

troops to have passed them by without severe difficulties. Nemirov, 110 ha, had 8 m ramparts and an acropolis of 12.5 ha; Motroninskoe was over 200 ha, a third of it enclosed within fortifications of earthen ramparts 10.5 m high and a ditch 4–6 m deep and 10–15 m across, and outside the fortifications, three cemeteries containing 60 tumuli; Trakhtemirov, 500 ha, was defended by earthen ramparts, ditches, and a wooden fortification. The largest, Belsk (4020 ha),⁵ had a defensive perimeter of 25 km, 4000–5000 inhabitants, ramparts 9 m high, and ditches more than 5 m deep. The site included three smaller settlements, each fortified, and nine other populated places (Tsetskhladze 2012: pp. 339–340 with bibliography).

Ctesias, writing about Ninos, king of the Assyrians, states that he had a strong desire to subdue the whole of Asia from the Tanais to the Nile and spent 17 years achieving this. Among the lands he supposedly conquered were “the barbarian tribes who live on the Black Sea coast as far as the River Tanais” (Ctesias, *Persica* F1b 2.1–3). The territories described are practically the same as those mentioned in Persian royal inscriptions. Maybe there is some confusion and the deeds are those of Darius? Tellingly, this passage survives only via Diodorus (2.1.4–28.7), a writer well known for confusing detail (see below).

Some confirmation of Ctesias’ information comes from Herodotus – that during Darius’ expedition the Persian army followed the Scythians all the way along the coast of Lake Maeotis and even across the Tanais (Hdt. 4.120–122) – and it is logical to propose that the Greek cities of the Cimmerian Bosphorus, mainly founded by Ionians,⁶ fell under Persian sway. This finds direct or indirect support in other sources.

Some archeological evidence requires an explanation from an historical perspective, however difficult: in the last third of the sixth century BCE, the Greek settlement at modern Taganrog in the far northeast of the Sea of Azov ceased to exist; in the middle/last quarter of that century we find traces of fire in Greek cities of the Cimmerian Bosphorus – Kepoi, Myrmekion, and Porthmeus. The last two have also revealed fortification walls of the middle/second half of the sixth century. Some interpret these as evidence of worsening relations with the Scythians (Tsetskhladze 2013: p. 208 with bibliography), but there were no Scythians in the Cimmerian Bosphorus (Taman and Kerch peninsulas) until the middle/second half of the fifth century BCE (Tsetskhladze 2013: p. 208 with bibliography). The dating, however, is largely consistent with Ariaramnes’ campaign. We can assume that the Greek cities did not welcome the Persian embrace and resisted hotly, though unsuccessfully. This may seem speculative, but not as insubstantial as linking walls, fire, and destruction to the threat of non-existent Scythians.

The Greek Bosporan kingdom in the Cimmerian Bosphorus has been considered a unique manifestation in the Classical period of a type of state that mushroomed in the Hellenistic period. Its establishment arouses much debate:

“Traditionally,” it arose c. 480 BCE under the Archaeanactidae, with Panticapaeon supremacy (Tsatskhladze 2013 with bibliography). Our only ancient written source, Diodorus (12.31.1), lacks detail and is susceptible to diverse interpretations: He mixes the order, names, and dates of Bosporan kings, and in 12.31.1 is describing events of 438 BCE (Tsatskhladze 2013 with bibliography). It is now clear that the territorial state dates properly only from the last quarter of the fifth century BCE and the accession of the Spartocids; events around 480 BCE were more localized: the Archaeanactidae took power in Panticapaeum and established a tyranny.

In the Late Archaic/Early Classical period, there are traces of fire and destruction at Panticapaeum and several other settlements, the vast majority situated on the Kerch peninsula not far distant (Tsatskhladze 2013: pp. 208–211 with bibliography). Some have slated this to the “Scythian threat,” which is regularly advanced as the supposed reason for the creation of a supposed Bosporan kingdom in c. 480 BCE: Greek cities uniting under Panticapaeon leadership to resist it. Herodotus (4.28) has been mobilized in support: “when the sea and entire Cimmerian Bosphorus are frozen over, the Scythians who live this side of the trench move in campaign over the ice and drive their wagons across into the land of the Sindi.” Nothing in this passage suggests that the Scythians’ crossing the ice caused friction with the Greeks, and Herodotus was writing about his own times, nearly 50 years after the supposed creation of the kingdom. An alternative interpretation must be sought, possibly one with an Achaemenid connexion. Examining the broader aspects and context of the Graeco-Persian wars, we might suggest that Persia wished to destroy the Milesian thalassocracy (cf. Hdt. 6.7). Earlier, with the Ionian Revolt, Persian support for the Ionian cities of the Black Sea ceased. Indeed, a fleet operating from Sinope or Heraclia Pontica may have destroyed the Ionian “network,” including in the northern Black Sea (Nielsing 2010: p. 127). Alternatively, during the Graeco-Persian wars, the Achaemenids may have temporarily withdrawn from this territory, acquired through Ariaramnes’ expedition and the Scythian campaign of Darius. The ensuing power vacuum provided the circumstances for the coup in Panticapaeum that established the Archaeanactidae (cf. Hind 1994: p. 488; Burstein 2006: p. 139). Any or all of these events might have contributed to destruction of various cities in the Cimmerian Bosphorus. A unique fragmentary cuneiform inscription dating to the time of Darius I was found in Phanagoria (Tsatskhladze 2019).

Diodorus (12.31.1) places the Cimmerian Bosphorus in Asia. Detailed study of his use of the word Asia has determined that he always means Persia (Koshelenko 1999), good reason for concluding that the Cimmerian Bosphorus had indeed been part of the Achaemenid Empire. Koshelenko also sought to identify when Persian control of the region commenced. Having analyzed the passage of Ctesias (F13.20), he believed, as separately did Nielsing (2010: pp. 127–128), that it was as a result of Ariaramnes’ campaign.

What of other evidence that the Cimmerian Bosphorus came under Persian control? After the Early Classical period, Panticapaeum changed its coin standard from the Aeginetan to the Persian (Fedoseev 1997: pp. 311–312; Nieling 2010: p. 131). Some coin types also carried the impression of an eight-pointed star, interpreted as a reflexion of an Achaemenid political orientation (Fedoseev 1997: pp. 311–312). Achaemenid influence is found in the titulature of the Spartocids in the Bosporean kingdom, as testified by official inscriptions (Tokhtasev 2001). Notably, symbols found in the grave of the Bosporean king Satyrus I (d. 389/8 BCE) in the Baksinsk tomb are Achaemenid.⁷ Some find in “Gylon’s treachery” (Aeschines 3.171–172) – where the Bosporean king gave Kepoi to Gylon as a reward for his having betrayed Nymphaeum – parallels with the reward to Themistocles when he entered Persian service, leading them to conclude that this practice was a sign that the Cimmerian Bosphorus was under Achaemenid rule (Koshelenko 1999: p. 139). Furthermore, personal names yield interesting data: In the northern Black Sea quite a number occur of Persian origin (Zgusta 1955: pp. 59–72, 273–278; Fedoseev 1997: pp. 312–313). We even have “Darius” in Panticapaeum (Fraser and Matthews 2005: p. 87).

The Achaemenid presence is largely invisible, at least difficult to trace, archaeologically (Miller 2010, 2011: p. 337; Boardman 2011: p. 199). This is a paradoxical consequence of the creation of Achaemenid court art and culture, which drew on those of all the subject regions and peoples, and adopted and adapted to create something distinctive that was superimposed on the original culture of the Persians themselves (“Persianizing” them?). Persianization, whatever it might be, is hard to identify, not least because of the deliberate practice and ideology of leaving the cultural identity of subject peoples intact and maintaining their ethnic identity (*pax Persica*) (Brosius 2011: pp. 136–138; see also Tuplin 2011). Objects from the far reaches of the Achaemenid Empire are mainly goldware, silverware, jewelry, and arms, often hard to date or to identify where produced. All can be labeled “Achaemenid international style,” but apportioning such more precise identifications as “Achaemenid court style,” “Achaemenidizing satrapal art,” or “Perso-barbarian” is problematic (Miller 2010; Rehm 2010).

The northern Pontus yielded six finds of metal objects of the fifth to fourth centuries BCE that can be described as Achaemenid or Achaemenid-inspired: the handle of the Chertomlyk sword; a rhyton from the Seven Brothers tomb 4, and bowls from the Solokha, Zhirni, and Zelenskoi tombs; and a rhyton from Kul-Oba (imitation Achaemenid) (Treister 2010: pp. 223–233).⁸ The outstanding Seven Brothers rhyton was produced in an Asia Minor workshop in c. 450–425 BCE (Treister 2010: p. 227). The Seven Brothers was the burial place of the Sindian kings (Goroncharovskij 2010), whose territory had been incorporated in the Bosporean kingdom; this rhyton is most probably a

diplomatic gift, attesting to direct links with the Achaemenid Empire (Goroncharovskij 2010: pp. 88–89; Treister 2010: pp. 248–250). Another people included in the kingdom were the Maeotians. Additional Achaemenid and Achaemenid-inspired items of the first half of the fourth century BCE were discovered in the Ulyap tumuli (Erlikh 2010). The Ulski tumuli also yielded the same kinds of objects, from the second half of the sixth century BCE, prompting Erlikh (2010: p. 61) to ask whether the workshops producing items for the Maeotian elite during the period of Achaemenid expansion were Near Eastern or Transcaucasian.

A remarkable number of Achaemenid seals – 19 – were found in the northern Pontus, especially the Cimmerian Bosphorus, dating to the fifth to fourth centuries BCE: six from Panticapaeum, the Bosphoran capital, others from Bosphoran cities (Anapa, Nymphaeum, Phanagoria), elsewhere including Chersonesus, and four, unprovenanced, allegedly from Kerch (Treister 2010: pp. 252–256; see also Fedoseev 1997). Some are fine examples executed in Achaemenid court style; one carries the name of King Artaxerxes; another, a Lydian inscription. Most were cut in Anatolia, and their iconography is typically Achaemenid (Boardman 2000: pp. 163, 166, 351; Nieling 2010: pp. 131–133; Fedoseev 1997; Treister 2010: pp. 252–256). These seals are clear indication of the presence of officials and ambassadors, thus of an Achaemenid presence. Recently, an Achaemenid coin was found near another Bosphoran city: Kytæum (Fedoseev 2012: p. 319).

In the Persian Empire, royal inscriptions frequently mention Saca(e). On the Bisitun inscription (DB) (Kuhrt 2007: pp. 141–151), Saca is given in §§ 21 and 74 as a country, and as a people (“who wear pointed hats”) in §§ 74 (twice) and 75; DPh, DH mentions Saca who are beyond Sogdiana (Kuhrt 2007: p. 476); DPe, Saca as a country (Kuhrt 2007: p. 486); DSe, § 3, Saca who drink *hauma* and Saca with pointed hats, and, after Ionians of the sea, come Saca beyond the sea (Kuhrt 2007: p. 491); DNa, § 3, Saca who drink *hauma*, Saca with pointed hats, and Saca who are across the sea (Kuhrt 2007: p. 502); and A3Pb 14–15, *hauma*-drinking Saca and pointed-hat Saca (Kuhrt 2007: p. 483). Paragraph 3 of Xerxes’ inscription (XPh) also lists Saca who drink *hauma* and Saca who wear pointed hats (Kuhrt 2007: p. 305). DSaa, § 4, mentions Cimmeria, the Babylonian term for the Scythians (Kuhrt 2007: p. 497); DSab is very interesting for mentioning Saca of marsh and Saca of plain, the same groups that appear on the Tell el-Maskhouta canal stela (Kuhrt 2007: p. 479; cf. Tuplin 2010: pp. 295–296).

Much has been written about the identity and categories of Saca (Lebedynsky 2006; Kuhrt 2007: *passim*; Tuplin 2010: pp. 294–298; Potts 2012 etc.). Saca is accepted as a synonym for the Scythians because of what Herodotus (7.64) wrote about peoples participating in Xerxes’ 480 BCE expedition against Athens: Those with pointed caps and native bows, daggers, and axes were

“Amyrgian Scythians but were called Sacae, for the Persians call all Scythians Sacae...”⁹ Herodotus also noted that some believe that the Massagetae were a Scythian people living beyond the Araxes (Hdt. 1.201).

In Achaemenid royal inscriptions, Saca/Scythians is used as a generic term for the nomads living along across the northern borders of the empire. Saca who drink *hauma* and those who wear pointed hats, based on their position in the inscriptions, have been identified as Saca/Scythians dwelling in the broad geographical territory of Central Asia – also reflected in the archeological evidence (Potts 2012) – and the Saca of marsh and of plain as all Scythians of the empire’s northern periphery, not as two distinct groups (Kuhrt 2007: p. 482).

Saca living between the Caspian and Aral Seas had been incorporated into the empire by Cyrus in 550–530 BCE (Jacobs 2007; Briant 2002: pp. 127–128; Lebedynsky 2006: pp. 45–49). They are also mentioned by Herodotus (3.90–94) in his list of satrapies. Several peoples and countries he names are not listed in Achaemenid royal inscriptions, however, and vice versa.¹⁰ To the north of the aforementioned Saca, tombs of the local nomadic elite of the South Urals have yielded 80 Achaemenid(-style) objects of the end of the sixth to the third century BCE (silver, silver-gilt, and gold vessels; jewelry, arms, etc.) (Treister 2010: pp. 236–250; Treister and Yablonskii 2012). An alabastron with a quadrangular inscription contains the name of Artaxerxes I. Several are possible diplomatic gifts. A precise historical explanation for their presence is difficult; obviously, they demonstrate a long-term relationship, paramount in which might have been Achaemenid interest in this region’s gold resources (Treister and Yablonskii 2012: I, p. 288).¹¹

The suggestion that the “Saca/Scythians beyond the Sea” were probably Getae (Fol and Hammond 1988: p. 247; Kuhrt 2007: p. 491) may be doubted. We should agree with Dandamaev (1989: pp. 150–151) that although Darius’ Scythian campaign was unsuccessful, his march deep into Scythian territory in pursuit of ever retreating adversaries justified his including the North Pontic Scythians in the list of subject peoples as “Scythians across the Sea.” There were few Scythians in Dacia; the few Scythian objects found on Romanian territory are now connected to the Scytho-Persian wars of the end of the sixth century BCE (Tsatskheladze 2012: p. 343 with bibliography; Alexandrescu 2010; Vulpe 2012).

Delegations and people(s) on the Apadana relief are susceptible to various interpretations, Delegation XIX has been identified as the Scythians, and XI and XVII as Saca of other sorts (Briant 2002: p. 175; see also Potts 2012). While not all these people were under direct Achaemenid rule, surely this demonstrates that the Scythians of the northern Black Sea were under some degree of Achaemenid suzerainty? The painted battle scene on one of the beams from Tatarlı obliges us to consider the iconography of the

Saca/Scythians. Probably it depicts the enemies of the Great King, shown as undifferentiated nomads and intended to be understood as the nomads of the north (Saca/Scythians, etc.) (Summerer 2007: pp. 18–20). Of course, he must vanquish them, especially mere nomads: such is a vital part of the propaganda of the royal image.

The Persepolis tablets provide evidence of Scythians in prominent positions (Kuhrt 2007: p. 764). Elamite Treasury tablet PT1 mentions Shakka (“the Scythian”), working under Baradkama, Treasurer at Persepolis 490–480/79 BCE, perhaps as his deputy (Kuhrt 2007: pp. 787–788). PF 1790 names Shaddukka the Zappiyan, possibly “a hypocoristic of ‘the Scythian (girl)’” (Kuhrt 2007: pp. 799–800). Were these two by origin Scythians from the North Pontic steppes or just generic Saca (nomads)? In their table and appendix of ethnonyms and pseudo-ethnonyms in Persepolis, Henkelman and Stolper (2009: pp. 274–275, 300, 306) mention neither Scythians nor Saca.

The relationship between the Scythians and the Greek cities of the northern Black Sea parallels that between the Odrysian kingdom, which Thucydides (2.97) clearly states was organized along the same lines as the Achaemenid state, and nearby Greek cities. From the late fifth century BCE onward, as they turned their backs on nomadism, the Scythians demanded taxes/tribute from the Greek cities. As with the Achaemenid Empire, these were discharged not just with money or precious metal objects but with the skilled labor of Greek craftsmen, whom the Scythians used to create their local elite culture (Tsatskhladze 2010: pp. 45–50, 53–54).¹²

DPe, § 2, mentions the “Yauna/Ionians beyond the sea.” Who were they? Tuplin (2010: pp. 296–297) rejects the idea that these were Greeks living in the northern Black Sea region. But we must give serious consideration to the view that the Bosphoran kingdom and the Greeks living there were indeed within the sway of the Great King, one way or another.

My aim has been to bring to light and together the main evidence of Achaemenid involvement in the northern Pontic littoral, primarily the Cimmerian Bosphorus and deeper into the Eurasian steppes. This evidence can bear various interpretations. Matters once thought settled have recently been reawakened: the location of Skudria, the identity/identification of the Yauna (Tuplin 2010: pp. 294–298; Rollinger and Henkelman 2009; Henkelman and Stolper 2009). There is a growing acceptance that steppe Scythia and the Cimmerian Bosphorus were outliers of the Achaemenid Empire (cf. Hdt. 3.97 and comment by Nieling 2010: pp. 132–133).

When did Achaemenid control begin? Possibly c. 519 BCE, when Ariaramnes crossed the Black Sea. Although Darius’ Scythian campaign was unsuccessful, his army passed through Scythia to the Tanais and beyond, strengthening Achaemenid presence in the region. Of areas of the northern Pontus colonized by (principally Ionian) Greeks (Tsatskhladze 1994), only the Cimmerian

Bosporus, the later Bosporan kingdom, demonstrates an Achaemenid presence. Unsurprising. Dynasts ruled here – far easier for an empire to deal with than disputatious Greek *poleis*. Furthermore, the Bosporan kingdom enjoyed close links with the Scythians of the Ukrainian steppes; and both were well endowed with material and human resources, attractions for the Great King. When this involvement ceased is also unclear, despite some linking it to Pericles' Pontic expedition – which may never have happened! If it did – c. 437/6 BCE (Plut., *Per.* 20) – it had few consequences, as Achaemenid features continue in the region in the fourth century BCE.

I have presented some slight speculation, but on the balance of the evidence and of probabilities, a connectivity with the Achaemenid Empire is more likely than not. The situation is reminiscent of Colchis and Caucasian Iberia. Once, it was inconceivable that they had been under Achaemenid rule; now, ever more evidence is emerging to show that they were, forming a lesser part of the Armenian satrapy (Hdt. 3.93: Armenia and adjoining lands as far as the Black Sea) (Tsetskhladze 1994, 2003, 2006/2007: pp. 81–85; Brosius 2010: p. 34, 2011: p. 140; Tuplin 2010: p. 293).

The experience in other parts of the Black Sea was that Achaemenid rule brought little friction for locals, Greeks, or Achaemenids (in Thrace, Colchis, or the southern Black Sea). For example, the Great King allowed the Greek cities of the latter to keep their own laws and institutions until the beginning of the fourth century BCE, additionally prohibiting his officials and satraps from meddling in their internal affairs – his principal concern was that the cities and local peoples paid the taxes and tributes he demanded and furnished him with troops and provisions as and when he required them (Tsetskhladze 2008b with bibliography).

NOTES

- 1 A masterly summary can be found in Briant (2002: pp. 141–143).
- 2 Bibliography focuses on recent literature, mainly western. The extensive eastern European literature can be found by pursuing sources here cited “with bibliography.”
- 3 On the “two Scythias,” the nomadic one of the Archaic period and the (semi-)sedentary of the Classical, see Tsetskhladze (2011: pp. 120–130 with bibliography).
- 4 According to Steph. Byz., the name *Skuthai* comes from the verb *skuzesthai* (“to be angry”). Some also connect it with such Greek words as *skudmainein* or *skuthros* (“angry”) (see Tsetskhladze (2008a: p. 315) with bibliography). The personal name Skythes was widespread in the Greek world, often borne by high officials (Tsetskhladze 2008a: pp. 310–313).

- 5 Some have identified Belsk as Gelonus, the city of the Budini burned down by the Persians (Hdt. 4.108, 123). See Tuplin (2010: p. 287 with bibliography).
- 6 On Greek colonization of the Cimmerian Bosphorus, see Avram et al. (2004: pp. 941–952).
- 7 From Fedoseev (2012: p. 319). I was not able to consult the original publication.
- 8 For Near Eastern finds of the Archaic period from Kelermes and other tombs in the Kuban, see Treister (2010: pp. 232–233). Also fragments of late seventh-/early sixth-century BCE silver rhyta from Scythian tombs in the Don area and in the Ukrainian forest steppe (Treister 2010: p. 233).
- 9 Sacae are also mentioned as fighting at Marathon (Hdt. 6.113) and Plataea (Hdt. 9.31, 71), and participating in a royal pageant of Cyrus II (Xen., *Cyr.* 8.3.9–19).
- 10 For the latest combined list, see Asheri et al. (2007: pp. 540–542) (compiled: M. Brosius).
- 11 Some Achaemenid objects were found in the Pazyryk tumuli in the Altai (Treister and Yablonskii 2012: I, 48–49). A hand-knotted carpet from the fifth tumulus, most probably produced in a Bactrian-Sogdian workshop and influenced by Achaemenid artistic practice, has been interpreted as a gift from the Achaemenid king to the local chieftain (Kuhrt 2007: p. 842).
- 12 Another example: an electrum vessel from the Kul-Oba tomb, depicting a Scythian soldier binding the wounds of his companion, finds echoes in Herodotus (7.181), which talks of Persians treating binding wounds with strips of the finest linen (Kuhrt 2007: p. 587).

CHAPTER 49

The Caucasus Region

Wolfgang Messerschmidt

The History of the Caucasus Region According to Primary and Secondary Sources

In dealing with the history of the southern Caucasian regions during the first half of the first millennium, there is an unfortunate lack of indigenous sources and not even the classical tradition can furnish us with much dependable information. As represented in the Greek sources, the kingdom of Colchis resembles a mythological construct rather than an historical entity and, in any case, there is no significant archeological or primary source tradition that we know of (Bill 2003: pp. 29, 34–35, 38). In all likelihood, Colchis and the eastern parts of modern Georgia (Kartli) were dominated by tribal structures including a clearly distinguishable elite, for which there is evidence in a number of sumptuously furnished burial sites (Lordkipanidze 2000: p. 8; Bill 2010: pp. 17–21, 24). There is less evidence for Albania (modern Azerbaijan), though, at least, Strabo (11.4.6) seems to describe a decentralized society closely adhering to tribal groupings, even if he does not clearly indicate for which period this is true. Urartu was the lone exception among the polities of this region: it could look back on political structures dating back to the early Iron Age, and there is some evidence of literacy and a literary tradition that can be used to gain further information on the history and culture of the Caucasus (Zimansky 1998: pp. 70–99, 100–167).

Based on the new and improved reading of the Nabonidus Chronicle (ii 15–16; Oelsner 1999–2000: pp. 378–380), we may with some confidence date the beginning of Achaemenid expansion into the Trans-Caucasian regions. According to the Chronicle, in the ninth year of the reign of King Nabonidus of Babylon (547 BCE), Kuraš of Parsu led his army against an enemy country, gained a significant victory, killed the enemy king and secured his new conquests with military garrisons. Unfortunately, the Chronicle is damaged in the exact spot where the enemy country is named, though new analysis seems to indicate that we may indeed read Uraštu (Rollinger 2008: pp. 5–7; for the arguments adduced by Zawadski 2010: 146–147, see now in detail Rollinger and Kellner 2019). That Urartu was part of the Persian Empire is confirmed by the Behistun Inscription from 522 BCE. In the Babylonian text, Darius I lists Urartu as being among the countries of the empire (Voigtländer 1978: p. 54), while in the Old Persian list of the *dahyāva* (= countries), we find the first attested mention of the name Armina (Schmitt 1991: p. 49), and the Elamic text mentions Ḫarminuya (Rollinger 2008: p. 61). Thus it seems fairly uncontroversial that both names may be seen as synonyms for the same region. The particular political traditions of Urartu were certainly known to the Persian rulers. It is certainly not by coincidence that Xerxes placed a trilingual inscription in the region of Van (Inscription XVa), close to the Urartian capital of Tušpa, so as to clearly emphasize Achaemenid domination (Kent 1953: pp. 113, 152–153; Schmitt 2009: pp. 180–182; cf. Briant 2002: p. 742). That the peoples of the Trans-Caucasian regions were permanently part of the Persian Empire is further attested by the available Greek sources, though the rather eclectic nature of the sources themselves prevent systematic analysis. We may glimpse some evidence for Achaemenid expansion beyond Urartu/Armenia in the account of Herodotus. If B. Jacobs (2000, 2006) is to be followed in his interpretation of Herodotus IV 98–142, the famous expedition of Darius I against the Scythians (512 BCE) was divided into two individual campaigns: while the Great King himself led his army eastwards across the Istros (= Danube), a second army advanced to the regions beyond the Caucasus. Though the original goal of the expedition, the conquest of Scythia, had to be abandoned, the conquered lands beyond the Caucasus seem to have remained under Persian overlordship. This, in turn, presupposes complete Persian control of those regions to the immediate south of the Caucasus. Thus, we may trace at least a temporary frontier of the Persian empire as running along the Oaros (= Sal), a tributary to the Don river. Here, according to Herodotus, Persian troops fortified the frontier by building a series of fortresses (Jacobs 2000: map p. 94; *here* Figure 49.1).

But Persian rule in Ciscaucasia seems not to have been lasting. Herodotus 3.97 explicitly describes the Persian empire as reaching to the Caucasus, while the peoples beyond the mountain range are said to be independent. This was probably

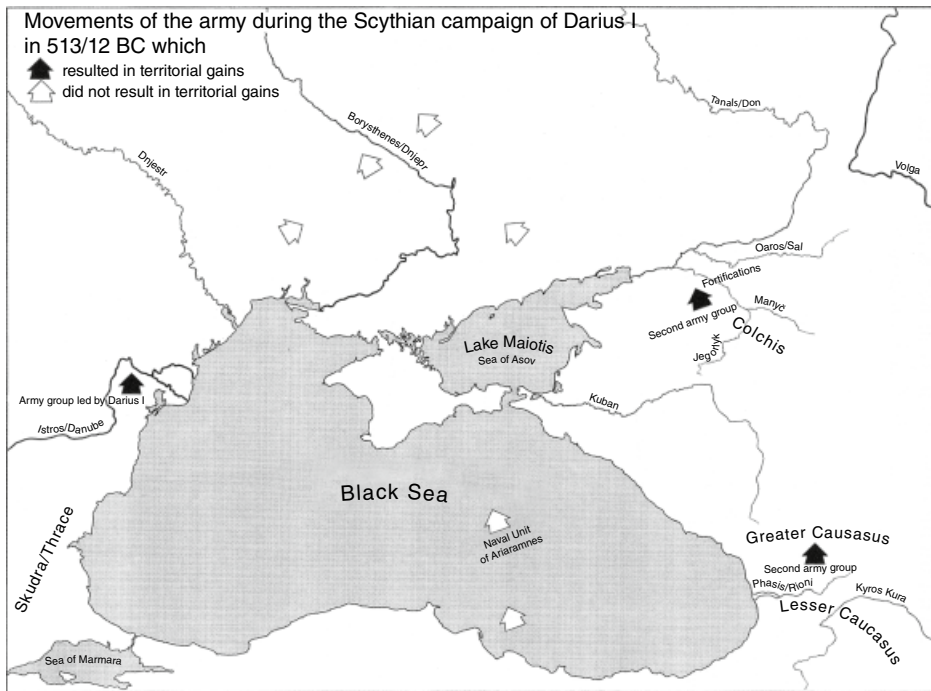

Figure 49.1 The Scythian campaign of Darius I in 512 BCE. Source: Modified by C. Marcks-Jacobs, reproduced by permission of B. Jacobs.

the political situation of c. 450 BCE. In addition, natural conditions suggest the Caucasus mountain ranges as a logical frontier (Jacobs 2000: pp. 99–100). Thus, the people of Trans-Caucasia may be assumed to have formed a permanent part of the Achaemenid empire. Indeed, the Trans-Caucasian Armenians, Colchians, and Saspeirians furnished troops for Xerxes' invasion of Greece (Herodotus 7.73; 79), as did the Alarodians, an ethnonym which may be etymologically related to the Urartians. This situation seems not to have changed until Alexander's conquest of Persia: Armenians, Cadusians, Albanians, and Sacasinians fought on the side of Darius III at the battle of Gaugamela in 331 BCE (Arrian *Anab.* 3.8.4–5; Curt. Ruf. 4.12.10–12). What is remarkable, however, is that the Armenian contingent fought under their own satraps, Orontes and Mithraustes, while the other peoples were led by the satrap of Media, Atropates. This would seem to indicate that, at least on an administrative level, the eastern Trans-Caucasian regions formed part of the satrapy of Media (Jacobs 1994: pp. 179–182).

There is more detailed evidence of this in Xenophon's account of the anabasis of the Ten Thousand in 400/399 BCE (cf. Jacobs 1994: pp. 183–186). According to this information, Armenia was divided into two individual satrapies (see also Briant 2002: p. 741). The governor of the smallish administrative region of western Armenia was subordinated to the satrap of the

region described as Armina in the Behistun Inscription. The latter position had been hereditary at least since the end of the fifth century BCE and was occupied by the descendants of one Orontes, a son-in-law of Artaxerxes II. The Orontes who led the Armenian contingent at Gaugamela was in all likelihood a grandson of the original Orontes (Messerschmidt 2000: p. 38f.). That Armenia was divided into two administrative units is further confirmed by the mention of two separate armies being sent to suppress a revolt in Armenia, as described by the Behistun Inscription (Jacobs 1994: p. 183).

A later addition to Xenophon's account of the Ten Thousand lists all those peoples that the Greek mercenaries came into contact with on their way through Armenia to the Black Sea (Xenophon *Anab.* 7.8.25). According to this list, a number of peoples had settled the easternmost Pontic and western Trans-Caucasian regions, namely Carduchians, Chalybians, Chaldaeans (= worshippers of Haldi reminiscent of Urartu), Macronians, Colchians, Mossynoecians, Coetians, and Tibarenians. According to the anonymous author, these peoples were "autonomous," and indeed they are listed after the satraps and the regions they controlled. But though we could understand this to mean that these peoples were not subject to satrapal rule, we should not assume that they were independent. Rather, we should assume that they were part of the Persian empire around 400 BCE, even if the campaign of Artaxerxes III against the Cadusians, as attested by Justin 10.3, seems to indicate a degree of disturbances in this region. Furthermore, the fact that, according to Strabo 11.14.9, Armenian ore mines aroused the interest of Alexander, presupposes the existence of such mines in Achaemenid times and their economic importance for the Persian empire.

Local source traditions of later periods provide us with further clues for Achaemenid rule in Armenia, though this evidence should by no means be taken at face value. The picture of Persian governance given by these sources is remarkably positive, which may be a reflection of the relatively stable and secure conditions under Persian rule. But we should not exaggerate the historical importance of this material, particularly in its references to religious conditions and the strong Iranian influence in this sphere, which may be due to later inferences (Meissner 2000: pp. 193–203).

Archeological Evidence for Persian Rule

If the literary sources only offer us a glimpse into the forms of Persian rule, archeological evidence, too, for a long time could not measurably further our knowledge. This has started to change with recent excavations. Indeed, archeological finds in central and eastern Georgia, in western Azerbaijan, and in Armenia itself, seem to indicate a form of Achaemenid direct rule over these regions (Knauss 2009: pp. 299–300; *here* Figure 49.2).

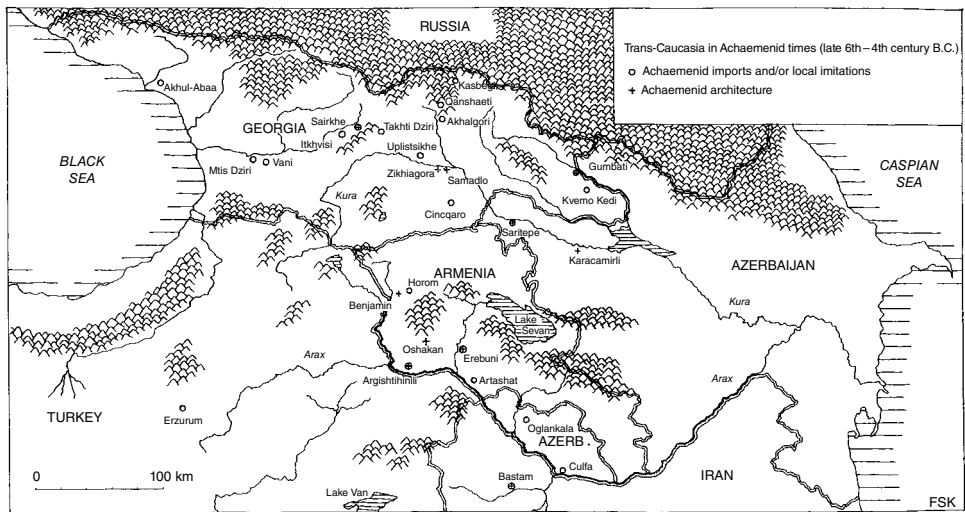

Figure 49.2 Map of Achaemenid Transcaucasia. Source: Modified by C. Marcks-Jacobs, reproduced by permission of F.S. Knauf.

In central and eastern Georgia – Iberia in the ancient sources – excavations have uncovered buildings in Sairkhe, Samadlo, Zikhiagora, Uplistsikhe, and Gumbati heavily influenced by Achaemenid models. Striking examples of this include bell-shaped bases of wooden columns and protomes of bulls that recall Persian royal buildings in Persepolis, Pasargadae, Susa, and Babylon (Knauss 2005: pp. 202–205; for Gumbati esp. Knauss 2000, 2005: p. 204, 2006: pp. 89–91). Such influences are also present in building in Sari Tepe and Qarajamirli in western Azerbaijan. Recently, a large estate was excavated in Qarajamirli, which comprised a central monumental complex, parks, and a representative entrance building (Babaev et al. 2007, 2009; Babaev and Knauss 2010; Knauß et al. 2013), and which may have been utilized as a royal residence. There are no earlier examples in Georgia or Azerbaijan as far as dimensions, quality of building materials, and execution are concerned. This dramatic shift away from pre-Achaemenid architectural forms in the Trans-Caucasian region can only be explained with a considerable influx of foreign craftsmen and specialists from the cultural centers of the Persian Empire (Knauss 2000: pp. 121–125, 2006: pp. 95–96, 105). It may be said with all due caution that the representative complexes of eastern Georgia and western Azerbaijan may be understood as architectural manifestations of the Persian administrative system, and that the architectural components had a programmatic character (Knauss 2000: pp. 121, 126, 2005: p. 204). There is much less evidence for Colchis, though here, too, protomes in the shape of a bull's head found at Vani recall Achaemenid architectural models (Knauss 2009: p. 299).

According to recent examinations, in Nachitshevan (southwestern Azerbaijan), too, Achaemenid influence is present. The simple constructed refuges of Çalxanqala and Vayxir Qala demonstrably resemble northwestern Iranian architecture of the sixth century BCE, while the monumental fortress of Oğlankale shows evidence at least of an Achaemenid-influenced construction phase with corresponding column bases (Schachner 2001: pp. 310–318). From this we may infer similar political conditions in modern south-western Azerbaijan as those prevalent during the Achaemenid period in eastern Georgia, Colchis, and Armenia. In the latter region, in contrast to Georgia and Azerbaijan, Achaemenid rule could rely on already developed administrative structures dating back to Uartian traditions. This continuity is also evident in architecture: Uartian fortresses in Erebuni (Erevan) and Argištihinili (Armavir) continued to be in use, ancient buildings within the fortresses were reconstructed, and new buildings of a more monumental nature were erected. In Benjamin/Draskhanakert, a new building in the style of a high-ranking residence was erected (Kanecjan 2000: pp. 103–110; Knauss 2005:

pp. 209–210, 2006: pp. 100–102), and the bell-shaped bases belonging to it again recall the representative architecture of the Persian capitals (Zardarian and Akopian 1994: p. 185; Knauss 2005: p. 209). The rather surprising discovery in Armavir of cuneiform tablets dating to the late sixth or early fifth century and written in Elamite is further evidence for the incorporation of Armenia into the empire-wide satrapal administration (Zardarian and Akopian 1994: p. 173; Knauss 2005: p. 210).

Further Achaemenid influences for the period from the middle of the sixth century onward are present in the ceramic finds of Iberia and the extant examples of golden jewelry from Colchis (Gagoshidze 1996: pp. 126–127; Knauss 2005: pp. 197–199, 2009: pp. 291–299), though there is no consensus among scholars as to what conclusions may be derived from this. O. Lordkipanidze and A. Bill claim that these influences are the result of cultural interactions across political borders and should not be seen as evidence of direct Persian rule (Lordkipanidze 2000: pp. 11–12, 2001: pp. 143–190; Bill 2010; but see Knauss 2005: p. 200, 2009: p. 291).

Still, some examples of Achaemenid-influenced artistic metalworking (toreutics) found in Georgian burial sites from the middle of the sixth century onward, seem to indicate a mounting intensity of contacts between Georgia and Persia proper. Taken on their own, they are certainly not reliable evidence for Achaemenid direct rule. But considered in conjunction with the numerous examples of Achaemenid architecture, we may interpret their appearance as burial gifts as being representative of a slow integration of Georgian elites into the Achaemenid system of redistribution (Briant 2002: p. 742).

The Achaemenid-influenced residences in eastern Georgia and western Azerbaijan were abandoned sometime around the middle of the fourth century BCE; traces of violent destruction are present in the ceramic evidence (for Gumbati: Knauss 2000: p. 127; for the apparently non-violent abandonment of Qarajamirli see Babaev and Knauss 2010: p. 248). Scattered evidence for later resettlement is probably indicative of an end of the political structures associated with these administrative buildings, though, in light of the paucity of our sources, we cannot be certain of this.

Remarkably, fourth-century Armenia seems to have witnessed a markedly different development: recent analyses show traces of a continuity of settlement from Urartian to Hellenistic times. This continuity may very well be indicative of enduring and stable political structures, particularly as Armenia continued to be ruled by the same dynasty after the watershed of 331 BCE, though now its representatives were no longer mere satraps of the Persian Great King but rather kings of Armenia in their own right (Zardarian and Akopian 1994: pp. 194–195; Messerschmidt 2000: pp. 39–41).

Bruno Jacobs and Birgit Gufler

Nomads and Nomadism: Ancient Sources vs. Modern Definitions

Embracing the whole Ancient Near East, the Achaemenid Empire was bordered by sea and deserts on its western, southern, and eastern sides: the Thar desert east of the easternmost provinces *Ḫataguš*/*Sattagydia* and *Hinduš*/India; the Arabian Sea, Persian Gulf, and Red Sea in the south; and the Mediterranean Sea in the west. In the south and southwest the sea borders were partly interrupted by deserts in the Arabian peninsula and in Northeast Africa. Whereas borders marked by the sea are clearly determined, boundaries in deserts are less well defined. The same must have been true in the north of the empire where the greatest part of its frontiers ran through the Eurasian steppes. According to classical, i.e. Greek and Latin, sources, these deserts and steppes were to a considerable extent inhabited by nomads.

With a focus on the Ancient Near East and Central Asia, Scharrer has on several occasions dealt with the key aspects of nomadism, providing a comprehensive overview of the research literature (Scharrer 2002a; 2002b: pp. 287–301; 2004). In this context he has also given a very succinct definition of nomadism in its various manifestations (Scharrer 2002b: pp. 288–291; cf. Potts 2014: pp. 1–3). In his view, nomadism is characterized, first, by pastoral farming as subsistence strategy (i.e. it represents a kind of pastoralism) and second, by a mobile lifestyle. So nomads are to be distinguished from all groups of

people who adhere to a mobile lifestyle but do not primarily practice pastoral farming, e.g. hunters, gatherers, etc. Again, since they change their whereabouts cyclically or periodically, the way of life of nomads must also be differentiated from any form of mobility whose purpose is simply to find a new place of settlement at the end of a period of migration. A third feature of nomadism stressed by Scharrer is that the term can be applied only to a collective. So transhumance, a form of pastoralism involving seasonal migration mostly from the summer pasture to the winter pasture and *vice versa*, is to be regarded as nomadism only if practiced by a whole ethnic group. Groups in which the majority is sedentary and only shepherds accompany the animals to their summer and winter pastures do not qualify for the label nomad (cf. Potts 2014: pp. 3–5).

That people whom ancient sources term nomads (Greek νομάδες, Latin *nomades*) do not necessarily satisfy these criteria is obvious. The term is applied to groups that practice pastoral farming as well as to ones that move around (Scharrer 2002a: pp. 182–186). So, ancient sources often do not allow us to decide whether a set of people are migrants, sedentary cattle-breeders, or genuine nomads (Scharrer 2002b: p. 291).

True nomadism can be sub-divided into various categories depending on the species of animals bred by the nomads in question or the sorts of mount that they use (cf. Lebedynsky 2006: pp. 163–166), but these distinctions cannot be addressed here. It may suffice to say that when dealing with the Achaemenid Empire's northern frontier, most classical authors concentrate their ethnographic attention on the Black Sea area (cf. Skinner 2012: pp. 68–78). Moreover, when they do turn their attention to Trans-Caspian nomads, they all seem to share the impression that the cultural behavior of the groups east and west of the Caspian Sea was essentially the same (cf. Briant 1982: pp. 181–183). The fact that the Babylonian versions of Achaemenid inscriptions call the Sakā *Gimirrāja*, i.e. Cimmerians, a word with consistently western associations, suggests that the same was true of Persians.

The Steppe Region: Nomads and Sedentaries in Contact

A major problem in the study of ancient nomadism is the relationship between nomads and sedentary populations and the possibility of symbiosis and mutual penetration between the two ways of life. (For the following see the – differently contextualized – discussion in Scharrer 2002b: pp. 292–296.) On a theoretical level one might wonder whether it is possible for nomads to pursue an autarkic subsistence strategy. In practice, the answer seems to be that it is not, and that interaction between nomads and sedentary people is therefore

inescapable. Such interaction was, in fact, already a topic in ancient ethnography, and Greco-Roman sources describe the resulting contacts in a variety of ways, frequently laying stress on the potential for conflict. Their view was that the two categories, nomad and settled, were quite distinct one from another, but in reality a strict dichotomy of this sort cannot be assumed to apply in all circumstances (cf. Briant 1982: pp. 9–56; Shaw 1982/1983; Scharrer 2004). This already makes it clear that to draw a contrast between “nomad” provinces (i.e. the various *Sakā* territories and *Uvārazmī* named in the Achaemenid inscriptions) and “sedentary” ones to their south is probably to be guilty of oversimplification (cf. Briant 1982: pp. 218–226, 2002: pp. 39, 747; Khozhaniyazov 2006: pp. 105–126, esp. 123).

Two possible models for describing the encounters (economic and territorial) and interdependencies between the nomadic and the sedentary ways of life may be noted. The first goes back to M.B. Rowton, who took a pre-existing idea of “dimorphisme” and developed the concept of a *dimorphic society*, with a focus on the relationship between *tribe* and *state*, the latter being manifested in a settlement (*town*) (Rowton 1967: esp. pp. 114–116; Rowton 1976: see esp. n. 4 with reference to further articles by the same author). This approach was criticized by N.P. Lemche on the grounds that it could not encompass the sheer diversity of the ways in which the two modes of life might intermingle. As a way of capturing this variety, Lemche suggested discarding the term *dimorphic* and speaking instead of a *polymorphic society* (Lemche 1996: pp. 39–41). A second model for describing the topographic and cultural permeability of areas of contact between sedentary and nomad populations is that of the frontier, as developed by S.B. Murphy. The underlying perspective here is that states are not homogeneous systems (because center and periphery are necessarily too dissimilar for this to be the case) and that their frontier zones, as areas of territory of simultaneous interpenetration and separation, have a distinctive dynamic caused by the ongoing struggle between elements in fusion and disunion (Murphy 2004: p. 77).

Both models may be useful when we try to understand the geopolitical and ethnographic situation in the vast territories east of the Caspian Sea whose nomadic tribes formed an integral part of the empire. When dealing with these areas we must not only consider the initiatives and methods used by the Achaemenids in their attempt to control them – something made difficult by the fact that at the moment we can neither say how far the various Saka provinces extended to the north (cf. the discussion in Potts 2012: esp. pp. 466–467) nor describe the divergent strategies of local control within their territories (cf. generally Rogers 2012) – but also be aware of the numerous possible forms of encounter between nomads and sedentaries within the state’s territory. Examples of the way in which different groups interlock and merge within a frontier zone are provided by the array of settlements and

strongholds in Chorasmia in Achaemenid times (Khozhaniyazov 2006: p. 123), or by the fact that seasonal campsites established by mobile pastoralists and permanent settlements built by agriculturalists are found next door to one another in ancient southeastern Uzbekistan (Frachetti and Maksudov 2014).

The primary sources, especially Achaemenid inscriptions, are silent about such matters, however; and classical sources are apt to conceal the realities either by treating nomadic groups as the opponents of Achaemenid armies or by introducing them into such armies in a stereotypical fashion, generally as a cavalry component under a native leader (Hdt. 7.64; Arr. Anab. 3.8.3, etc.). But representations of this sort may reflect an administrative perspective rather than the existence of a consistent mode of life within the whole territory; and in other instances such sources are well aware of the fact that the northern parts of the Achaemenid Empire and the areas beyond contained many different peoples with very divergent subsistence strategies. Herodotus (4.17–27) already provides the names of a significant number of population groups in the Black Sea region and further east, including hunters and gatherers, herds-men, and agriculturalists. Writing about the Parthian era, Strabo (11.8.2) informs us that *Dahae* is not the name of a single great tribe but a generic term for several entities, among them the Xanthioi (Exarthrioi), the Pissouroi, and the Parnoi, and a little later (11.8.6–7) he takes *Massagetae* as an umbrella term for a number of groups living in markedly diverging eco-systems and practicing very different ways of life. A similar view may be implicit in Pliny's lengthy list of Sacae peoples (NH 6.50).

Birgit Gufler and Bruno Jacobs

Campaigns of Achaemenid Kings in the Steppe Region and the Localization of the Saka Provinces

Achaemenid inscriptions list various provinces (*dahyāva*) which are to be located in the steppe region east of the Caspian Sea: *Uvārazmī/Chorasmia*, (country of the) *Dahā*/the *Dahae*, (country of the) *Sakā tigraxaudā*/the *Sacae with pointed caps*, and (country of the) *Sakā haumavargā*/the *Hauma laying Sacae*. In some of the Achaemenid lists of *dahyāva* we find a fifth name, that of the (country of the) *Sakā tayai paradraya*/the *Sacae who are beyond the sea*; this will be addressed below.

Reconstruction of the campaigns of Achaemenid kings in the steppe regions largely depends on the localization of the above-named countries and *vice versa* (cf. Jacobs 1994: pp. 257–260; 2010). Given the patchy quality of the sources, any reconstruction will necessarily be tentative. In the text of Bisotun, the oldest Achaemenid royal inscription, Darius specifies *Uvārazmī/Chorasmia* and *Saka/Saka country*. He reports that they *fell to his lot*, i.e. were inherited

from his predecessors (DB § 6). It is consistent with this that Babylonian administrative texts indicate that Chorasmiens (Zadok 1981: pp. 658–659 [UCP 9/2, 38 and 39, dated 534 BCE]; cf. Zadok 1976: p. 214) and Sacae/Gimirrāja (Dandamayev 1979: pp. 101–102 [BE VIII, 80]; cf. Dandamayev 2012) were present in Babylonia during the reign of Cyrus the Great and Cambyses II: so it is almost certain that the regions they came from had become part of the Achaemenid Empire before these texts were written.

In the main text of the Bisotun inscription (§§ 1–70), *Saka* (= “Saka territory”) is still not differentiated and the term acts as a general designation for the region of the Sacae. The same is true of the list in the inscription DPe (§ 6), probably written between 515 and 512 BCE. Here again *Uvārazmī/Chorasmia* and – sweepingly – *Sakā/(country of the) Sacae* are mentioned. This fits with the reliefs of the reception hall at Persepolis showing two delegations, nos. 11 and 17 (Figures 50.1 and 50.2), which probably represented those lands. The planning of those reliefs also goes back to the middle of the penultimate decade of the sixth century BCE (Jacobs 1997).

That the areas where the various Saka peoples lived in these cases are lumped together simply as *Saka/Saka country* (DB § 6) and as *Sakā/(country of the) Sacae* (DPe § 6) disguises the fact that – at least in the beginning of Persian rule – the peoples in question showed quite different attitudes and behavior toward the central authority. An example of this can be deduced from the Bisotun inscription. In § 21 the list of countries of whose revolt Darius learned during a stay in Babylon in late December 522 BCE includes just *Saka*, the *Saka country*. But when the king reports how he suppressed that uprising in his third regnal year, he calls the enemy *Sakā tayai xaūdām tigrām baranti/* the *Sacae who wear the pointed cap* (§ 74), thus distinguishing them from other groups.

Figure 50.1 Persepolis, Apadana, eastern stairway, delegation 11. Source: D-DAI-EUR-TEH1964-0264, reproduced by permission of the German Archaeological Institute.

Figure 50.2 Persepolis, Apadana, eastern stairway, delegation 17. Source: D-DAI-EUR-TEH1964-0262, reproduced by permission of the German Archaeological Institute.

We have no reason to doubt that these pointed-cap-wearing nomads were inhabitants of the *Saka country* and were among those whose insurgency had been mentioned earlier. And it seems equally clear that the *Sacae who wear the pointed cap* are identical with the *Sakā tigraxaydā*, the *Sacae with pointed caps*, who figure in lists of countries written after 512 BCE, where they always turn up alongside the *Sakā haumavargā*/the *Haoma-laying Sacae*, who are called *Amyrgians* in classical sources.

Now, it is wholly improbable that the territory of these last-named Sacae was conquered by Darius. Around 515 BCE he undertook a campaign beyond the (south)eastern borders of the empire to win the lower Indus valley (Sindh). Given the vast distances he had to cover for this undertaking it is very unlikely that during the same campaign he also proceeded to the northeast to subjugate the Amyrgians. Their territory must have been conquered already by Cyrus the Great.

In contrast to the campaigns of Cyrus against the Medes and the Babylonians, and of Cambyses against Egypt, we know nothing about the chronology of Cyrus' expeditions to the east or of the course of events there. Once again, the vastness of the territories involved forces us to postulate at least two campaigns, one to the later empire's southeast, i.e. to *Haraupatiš/Arachosia* and the lands thereabout, and one to the northeast, i.e. to *Bāxtriš/Bactria* and the surrounding territories. It may be the latter campaign (or a third one) that is in the background of the stories in Herodotus (1.201–214), Ctesias (FGrHist F 9 §§7–8. [Lenfant]) and Berossus (F 11 [Verbrugghe/Wickersham]) about the circumstances of Cyrus' death.

Cyrus' death is reported in many different versions. In Xenophon, he dies in Persia in bed, probably because a perfect life must not end with death on the battlefield. In Herodotus, Ctesias, and Berossus, he dies during an expedition into the Trans-Caspian region, in Herodotus still on the battlefield, in

Ctesias later due to a wound that he received fighting. In Herodotus, the battle was lost, as well as the corpse of the king (1.214). In Ctesias, the battle was won and Cyrus died only after having settled his succession (F 9[8]). According to Herodotus, the king's last struggle took place north of a river called Araxes; according to Berossus in a region named Daas. In Herodotus, the enemies are called Scythians; in Ctesias, the Persians are allied with the Sacae and fight against the Derbikes, who are for their part allied with Indians; in Berossus, the enemies are not named at all.

So it is extremely difficult – if at all possible – to reconstruct what happened and how the campaign went off. If we start with Herodotus, who gives the most detailed report, we are confronted with the proposition that at nearly 70 years of age, Cyrus proposed marriage to the queen of the Massagetae, Tomyris, with the aim of getting her kingdom as a dowry. When she refused, he decided to acquire her territory by war (Hdt. 1.205).

A fierce fight took place between Persians and Massagetae on the far side of the Araxes, here clearly to be identified as the Āmū Darjā. Herodotus describes the Araxes as having 40 branches, almost all of which end up in marshes and swamps (Hdt. 1.202) in a region whose inhabitants eat raw fish and wear seal skins, and the Āmū Darjā duly flows into Lake Aral, where seals are still to be found today (albeit threatened by ecological degradation). Moreover, one branch of the river, Herodotus tells us, ran west and emptied into the Caspian Sea, and this must be the Uzboj, today waterless and surely already in ancient times not a broad waterway (cf. Létolle 2000; Yagodin 2010: pp. 53–54).

If we venture to combine the divergent information in Herodotus, Ctesias, and Berossus about the successes and misfortunes of the campaign, the region where Cyrus lost his life, and the fate of the king's body, we may, with all due caution, suggest that an initial success was gained in the region between the Āmū Darjā and the Syr Darjā, but that the Massagetae retreated around Lake Aral and that Cyrus met his death in a battle on the other side – as Berossus says, in Daas.¹ The country of the Dahae is admittedly only localized between the Caspian Sea and Lake Aral by a much later source (Strab. 11.8.2), but there seems to be no reason to suppose a mass immigration into that area in Achaemenid or early Hellenistic times which was overlooked by the sources (Jacobs 2010).

If the events are reconstructed this way, they were seemingly similar to what happened about a decade later, when Darius campaigned in the same region to suppress the revolt of the *Sacae who wear the pointed cap*. He defeated the rebels, but apparently did not succeed in getting hold of their chief because there is no report about his punishment and execution, and, what is more, he is not even mentioned. That the man who is named in the text and depicted in the relief, the Saka Skunkha (here Figure 74.2), was not the head of the insurgency has long been understood (Nagel 1983: p. 172). Darius in his

inscription explicitly says that this Skunkha was head of another Saka group (DB § 74), and that he was deposed and replaced by someone else. As this group of nomads is never accused of rebellion it must have been hitherto independent. Not being an insurgent, Skunkha was neither humiliated nor executed. Visible expression of his different treatment is the fact that in the representation at Bisotun Skunkha is not deprived of his hat.

Apparently the Persian army was active in two neighboring regions, which were separated by a stretch of water. The army crossed it on tree trunks. Given the obvious tactical complexity of the campaign and the fact that the enemy was taken by surprise, this stretch of water must be the Syr-Darjā or a bay on the northern shore of Lake Aral.² Consequently, after having crossed it, Darius must have found himself in the territory of the Dahae. Apparently the nomads had again retreated around Lake Aral, but were checkmated and defeated by Darius' strategy (cf. Briant 1982: p. 188, with references to older literature). In this way the rebellion was put down and the territory of the Dahae, who had hitherto been independent, was annexed.

According to these reconstructions, the campaigns of Cyrus and Darius seem to have been largely parallel in character – apart from the outcome of the battle fought west of Lake Aral. If this is true, Herodotus' Massagetae and Darius' *Sacae who wear the pointed cap* should be identified (pace Briant 1982: p. 189), while Skunkha must be a leading figure among the *Dahā*.³

The *Dahā* are only actually named in a list of the empire's *dahyāva* from the time of Xerxes (XPh § 3). Because no further campaign to the empire's northeast is recorded in the sources, and because the two designations never figure side by side, it has been argued that the term *Dahā* replaced the phrase *Sakā tayai paradraya*, with both terms actually applying to the same region and inhabitants (Nagel 1982: p. 63) and *-draya* therefore designating the Caspian Sea. The common identification of the *Sakā tayai paradraya* with the Scythians of the northern Black Sea region (so that *-draya* referred to the Black Sea) has been criticized on the ground that Darius' campaign against this people was unsuccessful. It is true that in an article addressing all the problems connected with Darius' Scythian expedition, Tuplin raises the possibility that Herodotus' narrative, in which an alleged disaster beyond the Danube distracts attention from what was a successful Persian campaign in southeastern Europe, is the product of Greek misrepresentation and that the alleged disaster may not be historical (Tuplin 2010). But even if we accept for a moment the possibility that the Scythian expedition caused a temporary, if geographically limited, success, one may nonetheless wonder whether it is plausible that the territory of the *Dahā*, already conquered in the third year of Darius' reign, does not figure in a list of *dahyāva* until more than 30 years later. In light of these considerations it may still be preferable to identify the *Sakā paradraya* with the *Dahā*.

If we accept that two of the three Saka groups named in the latest Achaemenid list of countries are to be located east of the Caspian Sea (the *Dahā*) and between the Āmū Darjā and the Syr Darjā (the *Sakā tigraxaudā*), there remains only one group to be localized, the *Sakā haumavargā*, the Amyrgians of the classical sources. The solution can be found in the inscriptions DH and DPh, where Darius describes the extension of his empire not by enumerating the provinces but by naming its outermost points. The southwestern, southeastern, and northwestern corners are identified by the names of provinces, i.e. Nubia, Lydia, and India, while the northeasternmost region is said to be that of the *Sacae who are beyond Sogdiana*. This leads us to the far side of the Syr Darjā, to western Kirgistan and the adjacent regions of Kazakhstan to the north.

Fragments of Information on the History and Administration of the Steppe Area During Achaemenid Times

During Achaemenid times the countries of the Sacae as well as Chorasmia seem to have been governed by local rulers: at any rate, on the few occasions on which secondary sources say anything pertinent, the people in charge are always natives of the country. A certain Pharasmanes, who sought to come to an agreement with Alexander the Great, is introduced as king of the Chorasmians (Arr. Anab. 4.15.4: Χορασμίων βασιλεύς), although there can be no doubt that Chorasmia had been part of the Achaemenid Empire until Alexander's arrival. From that one can deduce that Chorasmia enjoyed a kind of autonomy. The same should be true for the Sacae, who took part in the battle of Gaugamela under their leader Mauaces, and followed the Bactrian satrap Bessus, as Arrian tells us, not as his subjects but on the basis of an alliance with Darius (Arr. Anab. 3.8.3). No foreign governor is ever mentioned in relation with these nomads, although they were without doubt subjects of the Persian king and bound to fulfill certain obligations, especially military service – for example, they took part in the battle at Marathon, forming the center of the front together with the Persians (Hdt. 6.113), and Amyrgians are said to have been involved in the campaign of Xerxes against Greece, again, as in the case of Gaugamela, under the satrap of the Bactrians (Hdt. 7.64).

One may therefore suppose that the man appointed by Darius to replace Skunkha after the defeat of the latter also belonged to the local elite and may have been a relative of the dethroned ruler.

It has long been recognized that the special status of the northern nomads was also indicated iconographically: the abovementioned delegations

no. 11 and 17 on the stairways of the great reception hall at Persepolis are the only ones that wear weapons. All six members of delegation 11 are depicted with an *akinakes* hanging down openly from the girdle and fastened by a strip around the right leg; the leader is additionally equipped with a bow case, a so-called *gorytos* (Walser 1966: pp. 85, Pl. 18, 56–57; here Figure 50.1). In a similar fashion, each of the five members of delegation 17 is equipped with an *akinakes* and at least the first four members of this deputation carry a *gorytos* in addition (Walser 1966: p. 93 Pl. 24, 69; here Figure 50.2).

The fact that the Sacae not only regularly followed the satrap of Bactria into battle⁴ but were among the final defenders of Achaemenid suzerainty against Alexander (Arr. Anab. 3.28.10; 4.5.4; 16.4; Curt. 7.7.32; 8.3.1) demonstrates that this political connection was especially attractive for the Sacae. Briant suggested that this solidarity was based on an historical tradition and nurtured by personal relations with particular satraps of Bactria (Briant 1982: pp. 213–226). But it can be better understood as the result of the administrative incorporation of the relevant regions into the empire, and one may also wonder whether the “frontier” model mentioned above helps to explain the attractiveness of the relationship in commercial and economic terms (cf. Yagodin 2010: pp. 53–54).

The administrative system that associated the Saka territories with the Bactrian satrapy, and may have included Chorasmia in a similar way (Jacobs 1994: pp. 177–178, 191), turned out to be a geopolitically stabilizing factor. It was only when the Seleucid Empire became weak in the third and second centuries BCE that nomadic tribes from across the northeastern frontier invaded the territory of the former Achaemenid Empire.

Already in Achaemenid times, however, one can observe a certain north–south movement. It has been suggested that names like Massaga or (M)Assakenoi betray an intrusion of nomads into regions situated further south. Massaga (Arr. Anab. 4.26.1–27.4; 28.4; Ind. 1.8; Curt. 8.10.22 [Mazaga]; Strab. 15.1.27 [Μασόγα]), applied by Strabo to the *basileion*, the capital, of the country of the Assakenians, recalls – as does also the tribal name itself – the appellation Massagetae (Litvinsky 1969: pp. 119–120), and the same is true of the names of princelings such as Assacanus (Arr. Anab. 4.27.4; 30.5; Curt. 8.10.22) and Assagetes (Arr. 4.28.6). All these personal, ethnic, and place names are encountered south of the Hindukuš in the Achaemenid province of Gandāra. The fact that descendants of nomadic groups could be found as settlers in this region by the fourth century BCE was probably the result of a long process of deep interpenetration between nomads and sedentaries.

Bruno Jacobs

NOTES

- 1 An interesting attempt to reconcile also the narrative of Ctesias (F 9: 7 [Lenfant]) with that reconstruction was undertaken by Nagel (1982: p. 63) and cf. Jacobs (2010: p. 6).
- 2 Rollinger (2014: pp. 198–200) has argued that the crossing of “the sea” drew on an old ideologeme and that the report is therefore not to be taken as historic.
- 3 The pointed hat of Skunkha does not identify him as a *Saka tigraxayda*. Although Miller pleads for this identification, she is quite right when stating that “the nationalities of Scythians on Persian reliefs are still problematic; although three names are recorded, the types of hat do not neatly fall into three mutually exclusive and distinguishable categories” (Miller 1991: p. 62).
- 4 For an interpretation also of the Masistes episode (Hdt. 9.108–113) as an indication of the adherence of the Saka territories to Bactria, cf. Briant (1982: pp. 207, 210–211) and Jacobs (1994: pp. 209–212).

CHAPTER 51

The Iranian East

Sören Stark

Environment

The lands of eastern Iran are situated in the eastern Iranian plateau, in the Turanian basin and in the Hindu Kush and Pamir-Alay mountains. Environmental features as well as cultural traditions vary considerably throughout this area. Most regions of the Iranian east, however, center on irrigation oases in river plains. These oases border either the desert-steppes in the plains or piedmonts, both of which were predominantly inhabited by mobile pastoralists which in turn entertained close economic and sociocultural links with the oasis populations. In addition, regions such as Choresmia and Sogdiana – and to a lesser degree also Margiana and parts of Parthia and Bactria – formed a complex frontier zone with the nomadic populations of the Eurasian steppes. Complex strategies of resource exploitation and sociopolitical interaction are also characteristic for the highlands of eastern Iran, involving irrigated and rain-fed agriculture, transhumant stockbreeding, and mining.

Problem of Sources

Our understanding of the history of eastern Iran and western Central Asia within the Achaemenid Empire is severely hampered by the paucity of written, and in particular narrative, sources directly relating to the Achaemenid east. A main problem is the limited perspective inherent to narratives related by

contemporary Greek historians: the lands east and northeast of the great Iranian deserts were far away and only indirectly – if at all – linked to events in which classical authors were primarily interested. As a result, evidence about the Achaemenid east derived from classical sources often remains laconic, vague, and is unevenly distributed chronologically. While there are important data for the reigns of Darius I and Xerxes I, and for the early years of Artaxerxes I, we hear almost nothing about the Iranian east for the following 120 or so years down to the reign of Darius III. Only in the context of the empire's military collapse during the reign of Darius III do classical texts again throw a sudden spotlight on eastern Iran and western central Asia (in fact, this is the most detailed narrative documentation for the Iranian east for the next 1000 years!) (Jacobs 2011).

The problem of uneven chronological distribution of written evidence is further aggravated by the extant epigraphic material from within the Achaemenid realm. The only narrative account from the perspective of the central government, the Bisutūn inscription, dates to the early years of Darius I. To the same reign date, beside other inscriptions of some relevance, are the Persepolis Fortification tablets. After Darius I, however, we are essentially left with highly standardized provincial lists. Even the important new corpus of Aramaic documents from Bactria, apparently dating from the reign of Artaxerxes III down to Alexander, cannot bridge the large gap of written evidence for the Iranian east during the second half of the fifth and the first half of the fourth century BCE. Currently, only archeological materials are available to fill this gap. But this category of sources presents a number of interpretational problems of its own (see Chapter 23 The Empire's Northeast).

The Establishment of Achaemenid Rule in Eastern Iran

The Iranian east seems to have entered into the orbit of Achaemenid politics with the submission of leaders from Hyrcania, Parthia, the Saka, and the Bactrians to Cyrus immediately after the fall of Ecbatana in 547 BCE (Ctes. F 8d-46). However, Cyrus turned his full attention toward the lands east of Media only after his campaign against Lydia, as he left Lydia in spring 546 BCE for Ecbatana “for his mind was on Babylon and the Bactrians¹ and the Saka and the Egyptians, against whom he intended to lead an expedition in person” (Hdt 1.153).

Unfortunately, our knowledge of Cyrus' campaigns in the east is extremely scanty. The only direct sources available are Herodotus, the fragments of Ctesias, and – for some very few glimpses – later classical authors. But none of these sources offers any coherent narrative regarding the course of events.

Even the basic chronological framework is, in view of contradictory evidence, a matter of debate – in particular the question of whether Cyrus' operations against the "Saka" and the "Bactrians" took place before or after the conquest of Babylon (540–539 BCE).² Also the actual extent of Cyrus' conquests in eastern Iran is very much a matter of conjecture. In the Bisutūn inscription, Darius I claims that Hyrcania, Parthia, Aria, Drangiane, Arachosia, Sattagydia, Gandāra, Bactria, Sogdia, and Choresmia were already part of the empire before his rise to power (DB § 6). An isolated piece of information is provided by a document from Uruk, which mentions a Choresmian messenger in Persian services as early as 534 BCE (Dandamayev 1992: pp. 164–165). This might indicate that Cyrus returned from his eastern campaigns with new Central Asian conscripts which he subsequently employed in the conquest of Babylon.

In addition, there are hints at the establishment by Cyrus of a cluster of garrison sites in the frontier zone at the middle Syr Daryā (Arr. 4.2.2.; 4.3.1; Cur. 7.6.16, 19; Just. 12.5.12; Strabo 11.11.4). The most important of these, Cyropolis, bore the name of its founder. Another one, called Gazaka (in Greek rendering), was probably the place of a storehouse (OP **ganza* – treasury) for the deposition of tariffs and taxes from which the Persian frontier garrisons were paid.

Apparently, the newly conquered territories in the east were considered strategically important acquisitions and consequently received particular attention: Cyrus installed his younger son, Bardiya, in Bactra as a sort of vice-king, exempt from paying tribute to the central court (Briant 1984: pp. 75–76). It seems as if the purpose of this appointment was both to secure this important position within the royal family and to offer compensation to a potential rival of the heir-apparent.

On the ground, however, the phase of the Achaemenid conquest of eastern Iran is – perhaps not surprisingly – barely detectable. A major rebuilding of the citadel of Old-Qandahār has been dated to the reign of Cyrus (Helms 1997: pp. 90–92), but this is far from certain. An early-Achaemenid date has convincingly been suggested for the foundation of Marakanda-Samarkand and its fortifications (Иневаткина 2002; Грене and Рахманов 2007). Especially in local and non-elite contexts (for instance, in ceramic sequences or in hydraulic technologies), the material culture of regions such as Margiana, Sogdiana, and Bactria is essentially shaped by local traditions and, hence, by continuities from the pre-Achaemenid to the Achaemenid horizon (Francfort 2005). However, there can be no doubt that the newly installed satrapal administration projected Persian authority into the wider region of Eastern Iran, aiming to guarantee the supply of garrisons, the collection of tributes, and the levy of troops used in campaigns of the Great Kings. In some cases – like with the Ariaspi in present-day Sistān – Achaemenid control was based on particular

treaties granting permanent tax exemption in return for submission and support (Arr. 3.27.4–5; Curt. 7.3.1–3).

But even with the assumed cooperation of local elites Persian rule seems to have faced difficulties at the northeastern frontier of the empire. Again, little is known about this beyond the fact that in 530 BCE Cyrus was campaigning in person in the east (Hdt. 1.205–207). As mentioned above, it is not even entirely clear whether this campaign was part of Cyrus' initial conquests in the east or a response to renewed hostilities. What is clear, however, is that this time his primary foe was the Massagetae, a strong nomadic grouping, probably situated in the Trans-Caspian steppes (Vogelsang 1992: p. 235). Although Herodotus and Ctesias present Cyrus as the aggressor, their representation could have been motivated to explain Cyrus' ultimate failure. In fact, it might well have been the continuous menace of nomadic raiding in eastern Iran (similar to Turkmen raids in approximately the same area until the beginning of the twentieth century) that ultimately forced Cyrus to take action. Greek accounts of this expedition are so heavily interwoven with legends that it is difficult to perceive the facts behind them. What is clear is that the Persian army was confronted by an enemy who successfully implemented a highly mobile war tactic. As a result, the Persians finally suffered a humiliating defeat during which the founder of their empire lost his life.

Eastern Iran and the Accession of Darius I

The “time of troubles” (Hdt. 3.150) following the violent accession of Darius I to the throne in 522 BCE was also felt in the Iranian east (Vogelsang 1998; Briant 2002: pp. 114–122). But on the eastern Iranian plateau and in western Central Asia open revolts remained limited to a single zone, namely the regions just south of the Karakum desert: Hyrcania, Parthia, and Margiana. It seems hardly a coincidence that all these regions directly border on the Transcaspian steppes, inhabited, most probably, by the Massagetae. Apparently, Persian control over the whole area had been only superficially restored in the aftermath of Cyrus' disastrous campaign of 530 BCE. Taking advantage of the chaotic situation at the center, local elites either sided with rebellious contenders in neighboring regions, as was the case with the Parthians and Hyrcanians who defected to the Median rebel Fravartiš (DB § 35),³ or supported a local candidate, as in Margiana where a certain Frāda was proclaimed “king” (DB § 38).

Apparently, Darius' final success in putting down these rebellions was to no small degree due to his father, Hystaspes, who held a high military command in Parthia (DB §35) and ensured the allegiance of the Persian troops stationed in this region to Darius. Perhaps Hystaspes' presence in the east was also

instrumental in securing the loyalty of two important satraps in eastern Iran: Vivāna in Arachosia and Dādarši in Bactria. Both responded to Darius' orders, which was crucial for crushing the rebellion in Margiana (DB §§38–39) and preventing a spread of Vahyazdāta's revolt into the southeast (DB §45).

In the following year (520/519 BCE) Darius campaigned in person against the “Sakā Tigraxaudā” (DB §74). It is not entirely clear where this campaign took place but most probably these Sakā “who wear the pointed cap” are identical with Herodotus' “Massagetae” against whom, nine years before, Cyrus had failed. Apparently, Darius was determined to deal, once and for all, with the danger these nomads posed to the northern frontiers of eastern Iran. This time the Persian troops were successful: they captured the leader of the enemy and Darius replaced him with a candidate loyal to him.

Achaemenid Rule in the Iranian East During the Reigns of Darius I and Xerxes I

By 519 BCE Darius' reconquest of the Iranian east was completed. The following eastern Iranian *dahyāva* appear on all of the existing “country lists” from the time of Darius I and Xerxes I (though in varying order): Parthia (Parthava), Aria (Haraiva), Bactria (Bāxtriš), Sogdiana (Suguda), Choresmia (Uvārazmī/Uvarazmīš), Drangiana (Zranka), Arachosia (Harauvatiš), and Gandāra (Vogelsang 1992: pp. 96–106). Some of these *dahyāva* seem to represent larger administrative units and must have included other regions not mentioned in the lists, such as Hyrcania (included in Parthia) and Margiana (included in Bactria). All these regions appear also – though in variant combination – among the tax-paying people in Herodotus' much discussed *nomoi*-list (Hdt. 3.66). For Bactria, this practice is now confirmed by an Aramaic document (dating to the last decades of Persian rule) mentioning “the rent of the king” (Naveh and Shaked 2006: p. 120).

Both Darius and, later, Xerxes continued the older practice of installing a younger brother of the heir-apparent as satrap in Bactra. An Elamite tablet from the citadel of old Qandāhar seems to indicate that the satrapal administration quickly introduced administrative practices from the heartland into regional contexts to create – at least in certain administrative sectors (such as the organization of travel along the “royal roads”) – a unified imperial system (Briant 2002: p. 448).

According to the foundation charters from Susa, precious raw materials from Bactria, Arachosia, Sogdiana, and Choresmia were used as building materials. In addition, the Persepolis Fortification tablets regularly mention *kurtaš* from the Iranian east or travelers from or to the east (Henkelman and Stolper 2009: pp. 300–306). Note that representatives of various eastern

dahyāvu are identified per inscription at Tomb I (Darius I) in Naqš-e Rostam (DNe), Tomb V at Persepolis (A³Pb; Artaxerxes III?), on the pedestal of the Darius statue from Susa, and on Darius' Canal stelae (Vogelsang 1992: pp. 142–145).

On a different plan, contingents from eastern Iran figured again and again in the Persian army, either during the Persian campaigns in Greece or as military colonists in Babylonia, Armenia, Cappadocia, Lydia, and even faraway Elephantine. To facilitate and secure these movements, a network of roads, stations, and fortresses span the Iranian plateau and Central Asia.

Finally, the eastern Iranian satrapies – especially Bactria and Sogdiana – seem to have been an area where exiles and prisoners of war from the western territories of the realm were frequently resettled or deported: Prisoners from Barca (in Cyrenaica) were settled in a Bactrian village while the deliberate exile of the Miletian Branchidae ended in Sogdiana. Tellingly, Ionian rebels were threatened by the Persians that their daughters would be “carried off to Bactria” (Hdt. 6.9).

The Iranian East from Artaxerxes I to Darius III

For the second half of the fifth into the thirties of the fourth century BCE information from written sources about the east is extremely sparse. But silence regarding matters on the Iranian east does not justify the assumption that the eastern satrapies were of lesser importance to the Great Kings than other territories of their realm. In particular, Bactria continued to be important to the dynasty and, at times of dynastic struggle, a resourceful basis for contenders to the throne. Thus, early in his reign Artaxerxes I was forced to focus entirely “on Upper (country) affairs” (Plut. Them. 31.2) because the satrap in Bactra – most likely Artaxerxes' brother, Hystaspes (Diod. 11.69.2) – rose in revolt. Apparently, Artaxerxes campaigned in person in the east until “all of Bactria surrendered to him” (Ctes. F14-35).

Perhaps this was not the only military campaign carried out by the central authority in the “Upper Satrapies” during the decades between the accession of Artaxerxes I and the final fight against Alexander – even though none is mentioned in any extant classical source. There is ample evidence for battle and triumph scenes from seals and sealings, depicting Persian victory over enemies wearing costumes typical for northeastern Iranians and central Asian people, in particular Saka, Choresmians, and Sogdians (Wu 2010: pp. 557–560). Some of these seals seem to date to the second half of the fifth century BCE and might commemorate successful Persian campaigns in the east (although it cannot be excluded that these scenes celebrate Persian triumph over enemies from the northeast in a more generic sense). Another hint for

eastern campaigns could be a short note on a Babylonian astronomical diary tablet reporting that in the spring of 369 BCE “the king mustered his [troops] for battle in the land Razaundu” (probably identical with Rhazounda east of Ecbatana in Ptol. 6.2.12 – see Kuhrt 2007: p. 400). Unfortunately, it is not clear from this short notice where these troops were heading, but they might well represent Median contingents to be sent eastward on the “Khorasan road.”⁴ Some more evidence for trouble in the northeast of the empire comes from two recently published Aramaic documents from Bactria (one of them dating to the year 348/347 BCE). Both documents mention the building of “walls” and “ditches” around cities in Bactria or Sogdiana, perhaps against nomadic incursions (Naveh and Shaked 2006: pp. 17, 24–25). This wall building seems to be confirmed by archeological evidence regarding a substantial reconstruction of fortifications at Afrasiab (Marakanda) and Koktepa in Sogdiana a few years before the end of Achaemenid rule (Rapin 2007: p. 42).

Only for the years during and shortly after the reign of Darius III are we suddenly provided in the context of Alexander’s campaigns with a number of valuable data which shed light on the topography, ethnography, and administration of the “Upper countries” during the final years of Achaemenid rule. In particular, the historians of Alexander reveal the existence of half-autonomous tribes in mountainous regions and – especially in Bactria and Sogdiana – the power of local aristocrats (called “hyparchs” in the Greek sources). Their resistance proved a major challenge to Alexander and forced him into prolonged guerilla warfare in Bactria and Sogdiana.

The End of Achaemenid Rule in the Iranian East

With the dethronement and murder of Darius III in July 330 BCE near the Caspian Gates, Achaemenid rule over the Iranian east entered its final stage. Being a member of the Achaemenid clan and supported by a strong contingent of Bactrian horsemen, Bessus, the satrap of Bactria and one of the plotters against Darius, was named “hegemon” of the remaining Achaemenid forces (Arr. 3.21.4) and retired to his satrapy. There he donned the royal robe and tiara and assumed the royal name “Artaxerxes” as “king over Asia” (Arr. 3.24.3), attempting to continue Achaemenid rule over the Iranian east. But this attempt was soon doomed to failure: Alexander quickly put down a pro-Bessus rebellion in Aria and then wiped out Bessus’ ally in the south, the satrap of Arachosia and Drangiana, thereby isolating Bessus and confining him to his own satrapy. In spring 329 BCE Alexander eventually crossed the passes over the Hindu Kush, quickly advanced into Bactria, and left Bessus no choice other than to give up Bactria and to retreat to the territories north of

the Oxus, where he hoped to find allies among the Sogdians, the Choresmians, and the “Scythians dwelling beyond the river Tanais” (Curt. 7.4.6). But this proved to be a disastrous move as most of his 7000 or 8000 Bactrian horsemen were not willing to follow him thither and, instead, “slipped away, each to his own village” (Curt. 7.4.20). Deserted by his most valuable forces it soon became apparent that Bessus, despite being proclaimed “king,” did not enjoy enough authority among the hyparchs in Sogdiana. When Alexander continued his pursuit, Bessus was arrested by the Sogdian nobles of his own entourage in the region of Nautaca (near today Shahri-Sabz) and finally handed over to Alexander (Arr. 3.29–30; Curt. 7.5.20–26). This ended, once and for all, the rule of members of the Achaemenid royal house over the territories in the Iranian east – although it took Alexander another two and a half years of campaigning to finally assert some degree of control over Sogdiana and Bactria.

Regional Overview

Bactria (Bāxtriš)

The satrapy of Bactria occupied a particularly prominent place among the eastern dominions of the Achaemenids. At times, the satrap of Bactria seems to have held a position somewhat comparable to a “vice-king of the east,” with competencies reaching far beyond Bactria proper. This is particularly clear for Bardiya, who is called “*despotes* of the Bactrians, Choramnians (i.e. Choresmians), Parthians, and Carmanians” (Ctes. F9-8). Still the last Achaemenid satrap of Bactria, Bessus, seems to have held a more prominent position than his satrapal colleagues in the east.

The satrap’s main residence was located in Bactra (today Balkh), apparently on the present-day citadel of Bālā Hissār. Recent archeological investigation has finally confirmed that the site dates back at least to the Achaemenid period (Besenval and Marquis 2007: p. 1867). Bactra also housed one of the cult statues of Anāhita, erected by order of Artaxerxes II (FGrH 680 F11). Other important cities in the satrapy were Varnu (Greek Aornos), Khulm, and Drapsaka. Recent findings of Aramaic documents, dating to the last decades of Achaemenid rule and possibly stemming from the satrapal archive at Bactra, give us rare insights into the organization and daily practice of Achaemenid rule in Bactria (see Chapter 66 Bactria).

Bactria was closely linked with the imperial centers: travelers to and from Bactria are frequently mentioned in the Persepolis Fortification Tablets (Henkelman and Stolper 2009: p. 301). In addition, Bactra is mentioned as the eastern terminus of a major road coming from Ephesus (Ctes. F 33). It must have been this road on which, according to Diodorus, it took four months for an army to march from Cilicia to Bactria (Diod. 14.20.4).

The importance of Bactria seems to be also reflected by the role Bactrian contingents played within the Achaemenid army: in Greece they were commanded by a brother of the Great King and formed, together with the Persians, Medes, and Saka, the core corps of the expeditionary army. In addition, some hints point to the settlement of military colonists from Bactria in Lydia and Cappadocia (Briant 1984: pp. 92–94).

Sogdiana (Suguda)

Sogdiana was very much a frontier region with close links to the open steppes beyond the Syr Daryā as well as to the mountain systems of High Asia. Although the population was concentrated in the river oases of the Middle Zerafshān (Marakanda/Samarkand), and the Kashka Daryā (Xenippa/Qarshi and Nautaca/Shahri-Sabz and Kitab), sizable groups of population lived as mobile stockbreeders – predominantly around the lower Zerafshān and toward the Middle Syr Daryā.

In terms of administration, Sogdiana apparently was connected with Bactria. At least in the days of Darius III, the satrap of Bactria held some military responsibilities in Sogdiana as he commanded the Sogdian contingents at Gaugamela. He was probably also involved in providing the central government with tributes (perhaps partially paid in rare mineral resources, such as carnelian and lapis lazuli; see DSf and DSz §10) and with workmen (Henkelman and Stolper 2009: p. 306). But how far his administration penetrated into Sogdiana is difficult to judge: we hear of a “royal residence” (*basileia*) in Marakanda-Samarkand (Arr. 3.30.6) which might have served as a satrapal headquarters in Sogdiana. There was also an extensive *paradeisos* near Marakanda (perhaps near present-day Penjikent in Tajikistan: Ešonkulov 2004). In addition, recently discovered Aramaic documents have been interpreted as evidence that the satrap of Bactria exerted close control over Sogdiana (perhaps even owning domains there), although there are some problems with this interpretation (Naveh and Shaked 2006: pp. 17, 24–25). However that may be, an important role was certainly played by local aristocratic families. Their powerful position was based on the control of territories which were densely populated, rich in farm produce, and clustered around strongly fortified residences (Briant 1984: p. 84). In addition, they could draw on sizable contingents of nomadic warriors as allies.

Margiana (Marguš)

Achaemenid Margiana was centered in the delta of the Murghāb, which empties into the Karakum desert. Written data concerning this region are extremely rare. It appears only in the Bīsutūn inscription (DB § 38) but not among the various “country lists” as it was probably administered by the satrap in Bactria.

In addition, Margiana was apparently located somewhat off the major lines of communication between Media and Bactria. That is why the Murghāb delta was not on Alexander's route and is consequently not mentioned by the historians of Alexander.⁵

Thus, only archeological data can help to cast some light on the region during Achaemenid rule. These seem to confirm that the citadel of medieval Merv – a round site similar to Bālā-Hissār in Balkh, today called Erk-kala – was founded during the Achaemenid period (Usmanova 1992).

Choresmia (Uvārazmī or Uvārazmīš)

Choresmia at the lower Amu Daryā was the most distant of the eastern Iranian *dahyāva*. Like Sogdiana it entertained close links with mobile pastoralists in the Eurasian steppe lands – predominately, via the Ustyurt Plateau, with those in the southern Urals. Close links also existed with the Chirik-rabat culture at the lower Syr Daryā.

From Choresmia the central government received turquoise (DSf and DSz §10). But more importantly, Choresmian soldiers appear widely in Persian services (in Babylonia, Greece, and Elephantine). From the lack of mention of Choresmian contingents in the Persian army rosters in the time of Darius III, and in particular from the existence of a certain Pharasmanes as “king of Choresmia” submitting to Alexander (Arr. 4.15.5), it has been concluded that Choresmia gained independence at some point after the reign of Xerxes I. But probably Achaemenid rule over Choresmia was generally of a more indirect nature than elsewhere in eastern Iran and largely content with the payment of tributes and the supply of troops, otherwise leaving domestic affairs largely to local dynasts. Thus, it seems as if Pharasmanes' symbolic submission to Alexander mirrors traditional patterns of Achaemenid rule over the region (Vogelsang 1992: p. 233).

Important archeological sites attributed to the “Achaemenid period” in Choresmia are Kyuzeli-gyr and Dingil'dzhe (Воробьева 1973; Вишнеvская and Рапопорт 1997).

Parthia (Parthava) and Hyrcania (Varkāna)

Parthia and Hyrcania, just south of the Karakum desert, seem to have formed one administrative unit and were obviously conquered already by Cyrus. Both Hyrcanians and Parthians served in Xerxes' army in Greece, and Parthian “lance-bearers” seem to appear in the Persepolis tablets (Henkelman and Stolper 2009: p. 306). In addition, Hyrcanian cavalrymen were stationed in several places in Asia Minor (Briant 2002: p. 794).

Little is known about the organization of Achaemenid rule on a satrapal level beyond the fact that – at least by the time of Darius III – Parthia-Hyrcania

had its own satrap. His official residence (*basileia*) in Hyrcania was a fortified place called Zadrakarta (Arr. 3.25.1). An isolated piece of information (Polyb. 10.28.2–4) tells us that the Achaemenid administration in Hyrcania was involved in the maintenance of sophisticated underground irrigation works.

Aria (Haraiva)

Achaemenid rule over Aria, the region around present day Herāt in western Afghanistan, is first mentioned *expressis verbis* in the Bīsutūn inscription, although it is most probable that this region was already subdued by Cyrus. Only during the time of Darius III do we hear of a “satrap of the Arians,” named Satibarzanes (Arr. 3.8.4). His residence (*basileia*) was at a site called Artakoana (Arr. 3.25.5), which is generally located on the citadel of present-day Herat. Aria provided troops for Xerxes I’s campaign in Greece (Hdt. 7.66), Darius III’s campaign in 331 BCE. Arians also appear in the second half of the fifth century BCE as military colonists in documents from the Murašū archive in Nippur (Dandamayev 1992: pp. 162–164). Several Persepolis tablets mention travelers to and from Aria without specifying their ethnicity or function (Henkelman and Stolper 2009: p. 301).

Drangiana (Zranka)

Drangiana was centered around the lower Hīlmand-rūd. Known as a rich agricultural oasis and for its tin deposits (Strab. 15.2.10), it was also important as a transit area, joining the “Khorasan road” (into Bactria) with the “Kerman road” (into Sind).

Drangiana features first in the Bīsutūn inscription as *dahyu*, but a certain “tribe” of the Ariaspi, living along the Hīlmand-rūd, is mentioned already in the context of Cyrus’ conquests (Arr. 3.27.4–5; Curt. 7.3.1–3). In 330 BCE Drangiana was part of the satrapy of Arachosia (Arr. 3.21.1). Drangians served in Xerxes’ army in Greece (Hdt. 7.66) and a certain “Ašpukka, the Drangian” is mentioned in the Persepolis Fortification Tablets as traveling from Persis back to Drangiana (Henkelman and Stolper 2009: p. 303).

The archeological site of Dahan-i Ghūlāmān has been interpreted as the Achaemenid capital of the region (Genito 2010).

Arachosia (Harauvatiš)

Achaemenid rule of Arachosia was exerted as early as 522 BCE by a satrap (DB III § 45, 47). Based on archeological evidence, the satrapal seat has been assumed to be on the citadel of old Qandahār. Perhaps this site is identical with the fortress Kapišākaniš, mentioned in DB III § 45 (Bernard 1974). In

addition, we know from the Elamite version of the Bīsutūn inscription that the satrap also held a fortress named Aršādā as “estate” (*irmatam*), probably serving as a collection, storage, and distribution center for local commodities from a surrounding agricultural domain (Briant 2002: pp. 444–445).

Arachotians served in Xerxes I’s army and at Gaugamela, where Barsaentes, the “satrap of the Arachotians and the Drangians” (Arr. 3.21.1), commanded also “Indian hillmen” (Arr. 3.8.3–40). The precise location of these “Indians” somewhere between Qandahār and Gandāra is a matter of debate, but most probably they are identical with the *dahyu* of *Thataguš* (Petrie and Magee 2007).

In addition, Arachosia sent *kurtaš* to the central court (Henkelman and Stolper 2009: p. 300) and paid taxes. Some stone mortars and pestles found in the Persepolis treasury have been identified as coming from Arachosia (Bernard 1972). Another item of tribute from Arachosia was ivory (DSf and DSz §11), once again pointing to close connections to “India.”

Paropamisadae and Gandāra

The mountainous territories to the south of the Hindu Kush divide, i.e. the lands around present-day Kābul (Paropamisadae) in the west and the Peshāwar and Swat valleys in the east (Gandāra), are very much a transitional zone between the Iranian east and the cultural sphere of northwest India (Punjab). The main regional centers were the site of Kapiši (Capisa) in Paropamisadae and Puskalāvati (Peucelaotis) in Gandāra. Archeological data (mostly ceramic assemblages) point to a rather regionalized character of economic interaction spheres (Magee and Petrie 2010: pp. 514–515).

There are some faint hints that Cyrus campaigned in the Kābul area (Plin. nat. 6.25.92); slightly later, Gandāra appears as a *dahyu* in the Bīsutūn inscription (DB § 6). Presumably, the Bactrian satrap held some responsibilities over the region (Vogelsang 1992: pp. 221–223; Briant 2002: p. 746), which also dispatched *kurtaš* to the heartland (Henkelman and Stolper 2009: p. 303). But regional affairs seem to have been mainly in the hands of local dynasts (Vogelsang 1992: p. 236; Briant 2002: pp. 756–757; Petrie and Magee 2007).

NOTES

- 1 Francfort (1988: pp. 170–171) opts for a date after the conquest of Babylon while Briant (2002: pp. 38–40) maintains the chronological order as presented by Herodotus.
- 2 On the much-disputed question of the existence and character of a pre-Achaemenid polity in “Greater Bactria” see Briant (1984: pp. 23–33).
- 3 However, this notice has also been linked with Artaxerxes II’s war against the Cadusians – see Kuhrt (2007: p. 400).

- 4 Perhaps because of older political traditions – see Boucharlat et al. (2005).
- 5 The identification of Curtius Rufus' (7.10.15) "urbs Margania" or "urbs Marginia" (near which Alexander is said to have installed six garrisons) with "Margiana" is certainly not correct (Sverchkov 2008: pp. 166–173).

CHAPTER 52

India

Kai Ruffing

Discussing Persian rule in India raises the problem of defining the region that is meant using the geographical term “India.” Thus the Republic of India is not identical with what the ancients called India. In fact, the modern name India derives from the Old Persian word *Hinduš*, which itself was taken from the Indian languages, in which the toponym *Sindh* was used. In Greek, *Hinduš* became Ἰνδός and Ἰνδία, designating the river and the surrounding region. The Romans used these toponyms too and in this way they were introduced into the languages of our times. In modern research scholars use a broader concept of India at least deriving from Classical literature, which includes the Khabul Valley, Gandhara, the Punjab, and the lower part of the Indus Valley (Dihle 1998: pp. 1–2) that are mainly parts of Afghanistan and Pakistan. The Achaemenid kings, on the contrary, by using the toponym *Hinduš* in the royal inscriptions evidently intended only the lower and the middle Indus Valley. The northern parts of India, as understood in a broader sense by classical literature, are referred to in the royal inscriptions as *Tataguš* and *Gaṇdāra* (Callieri 2006: p. 8). If not otherwise stated here, the wider connotation of India is used. Geographically, India is separated from the Iranian plateau by mountains, which are the western border of the Indus Valley (Vogelsang 1990: p. 98; Jacobs 1994: p. 265; Callieri 2006: p. 8). There are a lot of passes connecting Iran and India. Notably a northern route from Gandhara – around modern Peshawar – existed across the Hindu Kush to Bactria, a central route from the Indus Valley across the Soleiman mountains to Arachosia around modern Kandahar, and a southern route from the lower

Indus Valley to Carmania and from there to the Persis (Vogelsang 1990: p. 95). The good connectivity resulting from these passes, and supposingly from sea routes too, fostered intensive contacts between Iran and India.

The chronology of the Persian conquest of all these regions is anything but certain. Furthermore, the details regarding their incorporation into the Achaemenid Empire remain obscure. From Herodotus we know that Cyrus II was campaigning in Central Asia after he had left Asia Minor (Hdt. 1.177). Given the poor evidence provided by our sources, one can only guess that Cyrus on one of his campaigns in Central Asia found an occasion to cross the Hindu Kush and to subdue the northern parts of India. At least one can safely assume that the list of peoples named by Darius I in the Bīsutūn inscription as part of his empire is a result of the campaigns of Cyrus in these regions. Among the lands listed here we find *Tataguš* and *Gaⁿdāra* (DB § 3). Thus we may conclude that both lands were conquered by Cyrus sometime after the 540ies BCE or 539 BCE (Briant 2002: pp. 38–40; Jacobs 1994: p. 36).

The lower Indus Valley then was subdued by Darius I himself. In this respect the royal inscriptions give clear evidence. One peculiar feature of the royal inscriptions of Darius and of one inscription of Xerxes are the so-called *dahyāva* lists. The term *dahyu* refers either to lands or to peoples or to peoples dwelling in a certain region. The exact meaning of the word and the exact significance of the *dahyāva* lists are debated in modern research (Briant 2002: pp. 172–173; Jacobs 2003). Nevertheless, with the exception of the Bīsutūn inscription, the *dahyu Hinduš* is adduced in all inscriptions of Darius containing such lists (DNA; DPe; DSe; DSaa; see also DSab with a hieroglyphic land-list mentioning India) as well as in the one inscription of Xerxes (XPh). This means a Persian conquest of the Indus Valley took place sometime after settling down the revolts which broke out in the Persian Empire during the takeover of power staged by the first Achaemenid on the Persian throne. Further evidence is provided by Herodotus in a somewhat complicated manner. According to the Halicarnassian, Darius wished to know where the estuary of the Indus was situated. Thus he ordered Scylax of Caryanda (FGrH 709) to undertake an expedition down the Indus and from the estuary to Egypt (but see West 2012). After this expedition – as Herodotus puts it – Darius subdued the Indians and made a voyage on the sea (Hdt. 4.44). Although the Herodotean account raises some problems of geographical detail, one may be inclined to see his narrative as a reflection of Persian operations in the lower Indus Valley around 518 or 515 BCE (Vogelsang 1992: p. 207; Jacobs 1994: p. 265; Briant 2002: p. 140; Rollinger 2012).

Having been incorporated into the Achaemenid Empire, India became an important part of the spatial self-representation of Darius. He imagined the kingship as a universal one: The king presented himself on an ideological level as ruler of the world. In this concept *Hinduš* represented the southeastern edge of the inhabited world, its counterpart on the northwestern edge being

Lydia (DH_a; DPh). The graphical representation of Indians on the throne-bearer reliefs (DNe; A³Pb) as well as the Indian delegation staged on the tribute friezes of the staircases of the Apadana in Persepolis (delegation 18) are to be seen in the same ideological context (Briant 2002: pp. 173–175), which is not to be understood as a claim for a real domination of the whole world (Wieschöfer 2007: pp. 34–40). The same is true for the mention of Indian ivory used for the construction of Darius' palace in Susa (DSf § 11) and the building of the Apadana there (DSz § 10).

After incorporation into the Persian Empire, *Hinduś* became part of the administrative system like *Tataguś* and *Gaⁿdāra*. The presence of Indians with administrative tasks such as carrying a sealed document from India to Susa is attested in the Persepolis Fortification Tablets (PF 1318; see Giovinazzo 2000/2001: pp. 68–72). Furthermore, these sources give reason to suppose the existence of rather frequent contacts between *Hinduś* and the center of the empire (Giovinazzo 2000/2001: pp. 63–68, 72–74). *Hinduś* evidently became a satrapy of its own. At least, we find it the *dahyāva* lists as well as in lists of satrapies in Greek literature. In the Herodotean list of nomes of the Persian Empire, India represents the twentieth nome, which had to pay 360 talents of gold to the Great King (Hdt. 3, 94), an amount, according to the Halicarnassian, representing more than half of the tributes paid by all other nomes (Hdt. 3, 95). *Tataguś* and *Gaⁿdāra* are to be found as Sattagydae and Gandarioi in the seventh nome of the list (Hdt. 3.91.4). Although the exact meaning of this highly problematical list of nomes is intensively debated in modern scholarship (Ruffing 2009), the occurrence of the ethnonyms there as well as in the royal inscriptions can be interpreted as a reflection of the existence of at least two or three administrative districts in the region, which in the Classical sources is called India (Jacobs 1994: pp. 217–221, 235–247). Another hint for that is the presence of Indians in lists of the Persian army given by Herodotus (e.g. Hdt. 7.65; on these lists see Bichler 2007: pp. 76–78). The permanence of Achaemenid rule in *Hinduś* was sometime doubted by modern scholars, but Indians are mentioned as part of the troops of Darius III fighting against Alexander III (Kuhrt 2007: pp. 830–831).

Achaemenid rule in India and the way in which the Achaemenids imagined the extension of their empire in the royal inscriptions were an important feature for the development of the Greek geographical perception of the world. In the Greek construction of the oecumene, India became the southeastern corner of the world like in the imagination of space found in the royal inscriptions. Seemingly it was Skylax of Karyanda (on his “voyage” see West 2012) who localized fabulous people there, who were said to live on the edge of the world like the *Monophthalmoi* (the one-eyed) and the *Skiapodes* (those with shadow-providing feet). It was Hekataios of Miletus who developed first a concept of India as eastern fringe of the world (Zambrini 1982: pp. 104–109). His concept was criticized by Herodotus, to whom we owe a logos with a

highly literary description of India (Hdt. 3.98–105). Basic features of it were the abundance of gold guarded by dreadful ants and the copiousness of Indian peoples. Thus the Halicarnassian used the tributes of India as a main argument for supposing an abundance of money in the Persian treasury. Furthermore, he imagined India as an utopic fringe of the inhabited world, but contrary to his predecessors as well as to his successors he did not place there obviously fabulous people like those mentioned by Skylax (Ruffing 2010: pp. 355–358). His account was followed by the *Indika* of Ctesias of Knidos, who wrote his work at the beginning of the fourth century BCE. Ctesias is extremely important for the Greek views of India until the campaigns of Alexander III. He developed a very colorful picture of India, which to some degree supposingly is based on Indian realities (for a very optimistic view see Nichols 2011: pp. 13–27). But a main motive of his account is certainly to discuss Herodotean motifs, where Ctesias regularly maintains that the contrary of what Herodotus said is true. Besides that, one main feature of his description of India is the wealth it provided to the Persian king. Thus the India of Ctesias is an idiosyncratic mix of realities, perception of previous literature, and intentional history, since the *Indika* are to be seen in the context of his *Persika* and other minor works like the *Tributes of Asia* (Ruffing 2010). The campaigns of Alexander III gave reason for the development of a more complex picture of India in the Greek literature, which is impressed by Ctesian conceptions. But the experience of having been there with Alexander led to the development of new motifs and to a certain degree generated more precise geographical knowledge (Parker 2008: pp. 33–42).

SECTION V

STRUCTURES AND COMMUNICATION

CHAPTER 53

Roads and Communication

Wouter F.M. Henkelman and Bruno Jacobs

Introduction: The Sources

As with any subject relating to the Achaemenid Empire, evidence on roads and communication comes from a mosaic of sources. Each of these presents an incomplete if not lopsided picture. Herodotus, for one, looking from late fifth century BCE Greece, mentions only one royal road, the one that connected Sardes to Susa (5.52–53). His interest was the degree of connectedness within (the western half of) the vast empire. Other Greek sources often focus on individual travelers rather than on the infrastructure as such. A notable exception is Xenophon's *Anabasis*, which offers much detail on the route taken in 401 BCE by Cyrus, satrap of Lydia, on his march against his brother, Artaxerxes II, and on that of the return march of the Greek mercenaries.

In contrast to the Greek evidence, the Elamite Fortification Tablets from Persepolis document an administrative perspective on traveling: the organization and accounting of rations given to travelers on official missions at the way stations along the roads. This institutional view is also found in the Aršāma correspondence and documents from Achaemenid Bactria. Together, all these sources offer a variegated yet patchy image of an empire-wide communication network (surveys: Graf 1994; Briant 2002: pp. 358–387, 927–930, id. 2012; Kuhrt 2007: pp. 730–762).

The available sources are not limited to the Achaemenid period. Testimonies of the campaign of Alexander are certainly relevant since the Macedonian

army in most cases used existing roads (Seibert 1985: pp. 15–27 map 2). As Seibert (1985: pp. 15–16) points out, there is only a single mention of Alexander commissioning road work of his own (Arr. *Anab.* 1.26.1). Without great risk of stretching their potential, sources from the time of the Diadochi can equally be drawn into the picture. Diodorus reports on the movement of troops between erstwhile Achaemenid residences in the years 320–310 BCE, specifying marching and traveling times (Briant 2002: pp. 357–358).

Development and Extension of the Road Network

The Persians could fall back on roads built by their predecessors (cf. Graf 1993: pp. 151), the Assyrians, Babylonians, Lydians, etc., but they were keenly aware that successful territorial expansion was possible only by simultaneous development of the communication network. Thus, Xenophon writes that military detachments were sent ahead of Cyrus the Great's army to construct roads, wherever needed (*Cyr.* 6.2.36).

A road system must already have been in place during the reign of Cyrus; building activities at Taoce suggest that sea routes were being developed (cf. below). During Darius' struggle for power, the "rebel" Vahyazdāta could already dispatch troops via a route leading from Persis to Arachosia (DB §45). Military contingents sent by Darius to quell the uprisings all over the empire apparently used existing connections and the Persepolis Fortification archive testifies to a smoothly-operated road system that in 509–493 BCE embraced the whole empire. Nevertheless, it was probably during the reign of Darius that the system reached the perfection praised by Herodotus, with "royal roadhouses and excellent inns" (σταθμοί ... βασιλῆιοι καὶ καταλύσεις κάλλισται) situated at intervals of a single day's traveling (5.52.1).

The Network of Royal Roads: The Textual Record

According to Herodotus, the Sardes–Susa highway ran through Lydia and Phrygia to the Halys river, cut through Cappadocia and Cilicia, crossed the Euphrates (maybe at Zeugma: Comfort et al. 2000), traversed Armenia, and then reached the Tigris. Having crossed the river, it took a southeastern direction between the Tigris and the foothills of the Zagros mountains, crossing the Upper and Lower Zab and the Diyala, before reaching Susa (Figure 53.1). The exact course of the road, especially its central and eastern Anatolian sections, remains debated. Whereas most scholars have assumed a northern trajectory, which crossed the Halys twice before reaching the Euphrates (e.g. Seibert 1985: pp. 18–20; Müller 1994: pp. 20–31), French has argued, on the

Figure 53.1 Roads in the Achaemenid Empire. Source: Drawing by Joaquín Velázquez Muñoz and the authors.

basis of Herodotus' phrasing, that the river was not crossed at all, that the road reached the Euphrates at Tomisa, and that it was the predecessor of a known Roman paved road (French 1998; cf. Graf 1994: pp. 177–179 on two possible northern routes). Herodotus' assertion that the length of the road through "Cilicia" was only 15.5 *parasangai* seems to contradict the second option since "Cilicia" must be identical with Strabo's Cappadocia at the Taurus (Καππαδοκία πρὸς τῷ Ταύρῳ; 12.1.4), to be located between the lower Halys and the Taurus range (Jacobs 1994: p. 141, map I; Herodotus' description excludes that "Cilicia" applies to the region south of the Taurus range).

Diodorus states that the stretch from Babylon to Susa took 22 days (19.55.2). The road did not end at Susa, however, as Herodotus thought, but continued to Persepolis and the Carmanian border (Strabo 2.1.23 [C 79]) and further into India, as is amply documented in the Fortification archive (Giovinazzo 2000/2001). Diodorus mentions 30 days for the distance between Susa and Persis (19.17.6). The exact course of this stretch of the road is debated, though it may be assumed that it circled Khūzestān via the Deh Lorān, Mīān āb, and Rām Hormoz plains, bent into Fārs in the Behbahān area, passed through the Fahliyān valley, and from there continued to the Marv Dašt and Persepolis (see, most recently, Speck 2002; Potts 2008).

A road through the Cilician Gates was taken in 401 BCE by Cyrus, satrap of Lydia (Briant 2002: p. 359). Where exactly this route branched off from the Sardes–Susa road is disputed and partially depends on the preferred reconstruction of the latter's course. When Cyrus' army had transcended the Taurus it turned eastward and traversed the Amanus and the Euphrates. Proceeding toward Babylonia via the eastern bank of that river seems surprising, as most cities adjoining it were situated on the western bank (Joannès 1995). It therefore remains unclear what kind of roads the army used when marching toward Cunaxa.

On their *katabasis* from the battlefield, the 10 000 mercenaries marched a short stretch to the east, crossed the Tigris, wheeled left, and followed the Sardes–Susa road in a northwestern direction for a short while but did not cross the Tigris at Arbela; instead, they headed north to the Black Sea. From there, the army sailed home by ship, assuming that the coastal route through Paphlagonia west of Cotyora could easily be blocked and because several river mouths, including that of the Halys, would have to be crossed (Xen. *Anab.* 5.6.7). This same road presumably continued further westward, from Heraclea to Dascylium in Hellespontine Phrygia (Seibert 1985: p. 20). It is this stretch that must have been taken by the satrap Pharnabazus when he rushed eastward, alarmed by the arrival of the 10 000 Greeks at Heraclea (Xen. *Anab.* 6.4.24). A few years earlier, Alcibiades, in his failed attempt to reach Paphlagonia (and the Great King), again seems to have used the road (Diod. 14.11.3–4).

Yet another road branching off the Sardes–Susa highway was the one that led from the Tigris crossing at Arbela into Syria and further south. It is documented by a papyrus in which Aršāma, satrap of Egypt, lists administrative centers, including Arbela, of regions to be crossed by his administrator, Nakhthor, on his way to Egypt (Driver 1957: no. 6 = Porten and Yardeni 1986: A6.9). According to Graf’s reconstruction, the last center mentioned, Damascus, was the nucleus of a net of roads crossing the Levant. One of these should have followed the Mediterranean shore down to Gaza, where it branched into a route to Egypt and another known as the “incense road,” which may largely have fallen outside the empire’s direct control but nevertheless was of prime economic importance. Another road may have crossed the Transjordanian realm from north to south (Graf 1993: pp. 155–166). A transversal road from Dor, via Megiddo, to Damascus connected the two arteries (Roll and Tal 2008: p. 222). The reconstruction of these roads used to be based largely on the assumption that they were continued in the Hellenistic road system, which in turn was the basis for the Roman network (see, e.g., Graf 1993; French 1998), but it is now supported by other sources. Ostraca from Tel Arad and other sites in Idumea document the provisioning of travelers and their animals and reveal a system similar to that known from the Fortification archive (Naveh 1981; Briant 2009: pp. 154–155). Surveys, analysis of settlement patterns, and the presence of fortresses provide additional clues (Roll and Tal 2008).

When they were still marching northward in the Tigris region, Cyrus’ Greek soldiers used a part of the road that connected Ephesus to Bactria and India. This highway is said to have been described in terms of way stations and distances by Ctesias (F33 Lenfant). A little bit further south it must have branched off eastward and followed the Great Khorāsān highway to Ecbatana – a stretch used by Darius III on his flight from Gaugamela (Strabo 2.1.24 [C 79]) – and thence continued to the Caspian Gates. There it entered the region later called Ariane (see below), from which it continued further east. The stretch leading to Bactria was taken by Darius III and, in his pursuit, Alexander (Arr. *Anab.* 3.20.1–21.10; Curt. 5.13).

At the Caspian Gates, at the latest, the Ephesus–India road met the road that, coming from the Black Sea (Sinope and Amisus), passed Colchis and reached the realm south of the Caspian Sea (Strabo 2.1.3 [C 68]). It may be that this artery directly connected to Ecbatana, whence a well-known road descended, via Gabae (Īzadkhast or Ābādeh area), to Persepolis and, ultimately, Taoce at the Persian Gulf. It was this road that Alexander took (in a northern direction) after his sojourn in Persis (Arr. *Anab.* 3.19.1–5; Curt. 5.7.12). According to Diodorus, traveling from Ecbatana to Persepolis took about 20 days (19.46.6).

Alternative north–south routes connected Ecbatana to Susa. One, which is said by Diodorus to have run via Babylonia, a rather long detour, required 40 days of travel; a more direct but also more difficult road, through the Zagros, connected the two residences in just nine days (Diod. 19.2.8).

Other trajectories are implied by the Fortification archive, such as the one from Sagartia to Fārs and/or Kermān. The toponyms mentioned in the relevant documents are usually the destination or origin of travel, but may also be intermediate points on a longer route: they are, essentially, nodal points in an empire-wide network of regional administrative centers authorized to issue travel documents. The mobile court counts as one of these centers and is referred to in the expression “travel authorization from the King.” Otherwise, the archive mentions Anšan (in Fārs), Arachosia (also: Barrikana, Puzantiš), Areia, Assyria, Babylon, Bactria, Cappadocia, Drangiana, Egypt, Gandhāra (also: Barubaresana, Kapišiya), Hinduš, Hyrcania, Kermān (also: Puruš), Lebanon, Lydia, Maka, Matezziš (near Persepolis), Media (also: Ecbatana), Parthia (?), Pasargadae, Persepolis (also: nearby Matezziš), Sagartia, Saka territory, Susa (also: Elam), Syria, Tamukkan (Taoce), and a few unidentified places (Koch 1993: pp. 5–48; Henkelman and Stolper 2009; Briant 2010: pp. 34–43; Henkelman 2017; id. 2020). It corrects Herodotus’ Greek perspective in showing the extensive connections to/from the eastern and northeastern parts of the empire.

Parallel to the network of land connections, a system of waterways existed. This is true not only for Egypt, where the Nile functioned as the most important line of communication (Hdt. 2.7–9; cf. Strabo 17.1.2), but also for the Euphrates, the Tigris, the canals of southern Mesopotamia, the canals and rivers crossing Khūzestān, the navigable rivers in Fārs (Potts 2014; cf. Diod. 17.67.4 on the [Pasi]tigris), and the Indus, which became an important route in the wake of Scylax’s (Hdt. 4.44; Schiwek 1962: pp. 8–13) and Alexander’s journeys (Arr., *Anab.* 6.1–19; cf. Strabo 15.1.32f.; Schiwek 1962: pp. 24–32, 35–39). Routes along the seashores are known to have been used during military campaigns, such as Cambyses’ invasion of Egypt, Darius’ campaign against the Scythians north of the Black Sea (513/12 BCE), and Xerxes’ campaign against the rebellious Greek city-states (480 BCE). Obviously, such routes also had their relevance for commerce and communication. An example is found in YOS 3, 10 (reign of Cyrus), on travel by boat from Uruk to Taḥmāka, i.e. the administrative center known in Greek sources as Taoce, in the Borāzḡān area, just off the Persian Gulf coast (Tolini 2008; Henkelman 2008a; cf. Chapter 62 Persia).

As long as the groups involved were small, traveling over water was considerably faster than traveling overland. An Athenian embassy led by Diotimus covered the distance from Cilicia to Susa mainly by boat (Strabo 1.3.1 [C 47]; Briant 1991: pp. 78–79). Traveling from Babylon to Susa was

preferentially done by water. Travelers sailed down the Tigris and then up the Nār Kabari (Waczegeers 2010: pp. 790, 804; Briant 2010: p. 43; cf. Strabo 15.3.4–5).

The evidence gathered here reveals a system of empire-wide communication which the Achaemenids continuously strove to maintain and develop. The journey of Scylax, on the orders of Darius, is a telling case against this background (Hdt. 4.44). After his arrival at the mouth of the Indus, Scylax sailed west to the Red Sea, implying the chartering of a sea route between India and Elam and the circumnavigation of the Arabian peninsula. The latter accomplishment is also documented in an inscription on the statue of Darius from Susa. Similarly, Darius lay stress on the opening of the “Suez Canal,” by which at least for a short time the Red Sea and the Mediterranean were connected (DZc §3).

Royal and Ancillary Roads

The *viae militares* used by Alexander during his campaign in Asia should, as a general rule, have been those roads which are termed *royal* in other sources. Smaller or secondary roads seem to have been perceived as different from these. A road of relatively lesser official status may have been the above-mentioned Susa to Ecbatana route through the Zagros mountains. The movements of goods and people within the area under purview of the Fortification archive suggest a dense local road network; one has to reckon with hundreds of ancillary routes which linked small towns, villages, and homesteads to the main arteries.

The difference between royal and ancillary roads does not lie in the fact that imperial roads were paved, as has been assumed repeatedly (Graf 1993: p. 150): the archeological record is mostly negative in this regard (Wiesehöfer 1993: p. 117; French 1998: p. 16; Briant 2002: p. 362–363; cf. below). Rather, it lay in the level of maintenance, which – especially after heavy rainfall – meant that the royal roads were more reliable. In addition, royal roads had way stations at regular intervals, which was probably not the case for (all) secondary roads. Another difference surely was that the royal roads were wider (Seibert 1985: p. 17), since they were made to serve larger military contingents as well as baggage trains with numerous vehicles (cf. Arr. *Anab.* 3.8.6). Xerxes is said to have traveled to Greece partly on a ἄρμα (probably a chariot), partly in a ἄρμάμαξα (probably a four-wheeled wagon; Hdt. 7.41). Diodorus describes the baggage train that followed the Persian army to Issus, including gilded vehicles (17.35.1–4, ἄρματα κατὰ χρυσά; cf. Curt. 3.36.22f., Diod. 17.35.5). Only wider and well-maintained roads would allow for the use of such means of transport.

The Institutional Perspective: Persis, Bactria, Palestine, and Egypt

Travelers on the roads could be officials, delegations from the satrapies, foreign embassies, fast messengers and detachments transporting taxes and tributes. Teams of dependent workers (*kurtaš*) and individual craftsmen were also sent to and from different parts of the empire (Briant 2010: pp. 40–42; Briant 2012: p. 192). The use of the network for long-distance trade is not documented, but that may be a function of the nature of our (institutional) sources. At any rate, much commerce may have been realized by boat. Similarly, the travels of Babylonian businessmen to Susa, presumably for fiscal purposes (Waezeggars 2010), would probably not be organized by the state.

All official travel took place on the basis of a sealed travel authorization (Elamite *halmi*, also *miyatukkam* = Old Persian **viyātika*-), typically issued by a satrap or the king and written in Aramaic. Journeys crossing several administrative regions might have required a super-authorization on the basis of which subsidiary authorizations were issued for each stretch of the road; Aršāma's letter on behalf of Nakhtōr (cf. above) could be read as such, but other solutions are possible as well. At any rate, authorizations could be replaced, as in the case of the 94 men traveling from Lydia to Persepolis, yet with an authorization from the satrap of Susa (NN 0901). The phenomenon may have been quite regular: behind some of the many documented travels to/from Susa and Persepolis, journeys to/from more distant centers may be hidden (Briant 2010: p. 36). Apart from Aršāma's letter, no actual travel authorizations have been preserved, but they are implied on a massive scale in the important corpus of tablets relating to travel within the Fortification archive (see Hallock 1969: pp. 40–45, 50; Giovino 1994; Tuplin 1998: pp. 77–102; Seibert 2002; Henkelman forthcoming). Some of the Arad ostraca seem to be terse orders for the allocation of rations; if so, they probably refer to local travel *or* they functioned as intermediate documents (based on the authorizations, and later used to draft receipts and accounts).

As shown by the Nakhtōr document, authorizations stipulated the number of travelers, their destination, and the quantities of commodities they received as travel rations at the way stations along the roads. An authorization sometimes was valid for the return journey as well (Briant 2012: p. 192). As the Fortification tablets show, separate receipts were drafted for each commodity at each way station and these were countersealed by the storekeeper and the traveler, the leader of the travel party or its guide. Fodder for horses and pack animals was also documented separately. Fortification texts on camel caravans, such as the one from Gandhāra to Susa (NN 0431), show that such transports were not limited to the trans-Arabian routes (cf. Arr. *Ind.* 43.1–5; Henkelman 2017: pp. 55–63).

Seals were essential to the process: even the most modest traveler was expected to have a personal seal. Rare cases whereby the traveler used an ear-ring or coin as makeshift mark confirm the rule (Root 2008: esp. pp. 89–93). Another striking aspect is that the satrapal and royal seals on the authorizations were, apparently, recognized throughout the empire.

Keeping the stores of the way stations filled with sufficient commodities was a giant logistic operation (cf. Ps.Arist. *Oec.* 2.2.38) and one of the main *raisons d'être* of regional institutional economies of the kind documented by the Persepolis archive. There is direct evidence for other administrations using Elamite documentation at Susa and Qandahār (Arachosia), and indirectly evidence for Ecbatana, Gabae, and Taoce (Henkelman 2008a, 2008b: pp. 78–79, 110–120, id. 2017). Apart from the Arad ostraca, there are Aramaic documents on leather and wooden tallies from fourth-century Bactria; they reveal, among other things, the logistics of the communication network in the northeastern part of the empire and have many traits in common with the Fortification material (Shaked 2004: esp. pp. 28–29; Briant 2009: pp. 148–151; cf. Chapter 66 Bactria).

Most travel rations represent basic nutrition levels, also in the case of free men (*šalup*); commodities other than flour and (less often) beer or wine are rare. Certain travelers received slightly or much higher rations (Seibert 2002); in some cases it is clear that the administration anticipated that an elite traveler would feed a private entourage from the commodities issued. A striking example of rare meat rations concerns 259 shipmen traveling from Persepolis to Media (NN 2261:4).

Armed teams (lance bearers) inspecting the roads are mentioned in the Fortification archive. Though they are sometimes described as, literally, “road counters,” their assignment clearly had to do with controlling rather than with measuring, as confirmed by equivalent designations (Tuplin 1997: pp. 406–409; Henkelman 2002: pp. 16–31, id. 2017: pp. 72–77). Once, road inspectors are said to approach the king at Susa, doubtless in preparation for his advance to Persepolis (PFa 22); on another occasion such officers inspected a certain stretch of the road and then waited for the king to arrive (PFa 30:8–10). Clearing the road of scorpions (Ael. *NA* 15.26; Ps.Arist. *Mirab.* 27 [832a]) and fallen trees (Ps.Arist. *Oec.* 2.2.14) may have taken place under the supervision of road inspectors as well.

Archeological Evidence

A stretch of the royal road could be traced over 43 km northwest of Naqš-e Rostam; it traces the edges of the Marv Dašt at a slightly elevated level in order to avoid inundation by the Kūr River. Rock-cut passages show that it was 5 m wide (Kleiss 1981; cf. Nicol 1970: p. 279; Sumner 1986: p. 17). An

excavated section at Bard Burīdeh also measured 5 m in width, was construed from 15 cm deep stone gravel sealed with reddish soil, and was lined with curbstones; it was associated with a 82 m long stone causeway cum wooden bridge structure (Nicol 1970: pp. 269–281; cf. Briant 2002: pp. 362–364 on bridges). Narrower rock-cut passages in the Tang-e Bolāgi are now understood as irrigation canals (Atai and Boucharlat 2009: pp. 23–31; Boucharlat 2011: pp. 566–570).

Two-way stations, at 26 km distance, have been identified between Naqš-e Rostam and Rāmgerd, near Garmābād and near Banī Yakeh (Kleiss 1981). A similar structure was excavated in the Tang-e Bolāgi (Asadi and Kaim 2009), and a fourth is known from Deh Bozān on the Khorāsān highway, c. 70 km northwest of Bīsotūn (Mousavi 1989; see also Boucharlat 2005: pp. 245–246; Yaghmace 2006). Surveys in the Deh Lorān (northern Khūzestān) and Mamasanī (western Fārs) plains have tentatively identified stops based on the intervening distances between sites (Neely and Wright 2010: p. 112; Askari Chaverdi et al. 2010: pp. 294–295). Some of the Achaemenid sites identified in the area between Šūštar and Rām Hormoz are also likely to be, or include, way stations (Moghaddam and Miri 2003: pp. 102–103, 2007: pp. 41–45). Further away, in the Surkhandarya valley of Achaemenid Bactria, a series of waystations may tentatively be identified (Wu 2018).

Other sites, generally referred to as “pavilions,” were probably not regular way stations but local administrative centers and representations of royal authority. At least some were located far from the main routes. Nevertheless, they could also host traveling groups, be it of a higher rank: the royal court, royal women, high administrators, etc. (Boucharlat 2005: pp. 272–274; Henkelman 2012: pp. 957–959 [with references]).

Means of Communication

Messages could be carried by various media. Most regular was the sealed written letter, presumably mostly in Aramaic (Hdt. 3.126–128). The installation of a new satrap, such as Cyrus at Sardes (Xen. *Hell.* 1.4.3), or a displacement, like that of Tissaphernes (Diod. 14.80.7–8; Polyæn. 7.16.1), was announced by letter. The transmission was typically the task of the fast messenger service, which used specially selected horses (Gabrielli 2006: pp. 45–62) that were changed at way stations. It was known as ἀγγαρίον in Greek (Hdt. 8.98, Xen. *Cyr.* 8.6.17–18); in the Fortification archive, the term *pirradaziš* (Old Persian **fratačiš*, “express runner, express service”; Tavernier 2007: p. 421) is widely attested, almost invariably in connection with the king. A recent calculation suggests that by means of the relay system, the distance from Sardes to Susa could be covered in about 12 days (Colburn 2013). There is evidence of a

relay system, but also, as a slower alternative, for the use of single messengers or emissaries (Jacobs 2003: pp. 254–256).

For less complex messages, other communication systems could be used (Wiesehöfer 1993: pp. 115, 350): fire beacons (Hdt. 9.3; Ps.Arist. *De Mundo* 298a; cf. Diod. 19.57.5) or transmission by guards posted within aural distance from each other (Hdt. 4.141; Diod. 19.17.6–7).

Communication and Connectivity

The imperial roads served the king as much as they integrated the empire; their security was crucial to the state and a precondition of any political action. Travelers were to be safe, taxes and tributes were not to be lost, military contingents had to be able to move swiftly and without hindrance. Thus, the existence and importance of the intricate network presupposes a high degree of political stability. The danger of highway robbery seems implied in *Ezra* (8:22, 31), but the same text refers to the possibility of military escorts and should not be taken as a sign of general insecurity. Traveling was considered safe and roads were protected by fortresses (Hdt. 1.52); the Fortification archive frequently speaks of travel guides (*barrišdama* = **paristāva*-; cf. Seibert 2002: pp. 35–39) accompanying groups of travelers, but not of larger armed escorts. Still, glitches in the system occurred from time to time: an opaque reference to “a previous travel authorisation lost on the road” (NN 1465) may serve as a case in point.

Probably still more important than the physical safety of travelers was the continuity of internal communication, for the high level of connectivity was a prime integrative factor of the empire. The relay system with fast messengers struck Herodotus as especially praiseworthy (8.98). Ancient authors already observed the relationship between regularity of communication and the central power’s ability to intervene in conquered territories (Briant 2002: p. 357). Moreover, communication speed within the Persian Empire was unusually high, higher than in, for example, the Roman Empire (Colburn 2013). As such, the network of roads, the empire’s circulatory system, was a factor of immense political consequence. The level of connectivity surely must be counted among the main reasons why the vast Achaemenid Empire remained stable for more than two centuries. An explicit imperial ideology underpinning this cohesion is not in evidence (Briant 2002: pp. 79–80) and may have been rooted primarily in more pragmatic levels of administration, notably in the intense communication between super- and subordinated offices within clearly-structured administrative hierarchies. These existed in a network of regional administrative systems stretching from Arad to Bactria, often betraying a repeating imperial signature with parallel structures and standard protocols supporting interregional travel and communication.

The Extent and the Borders of the Known World

As mentioned above, the duration of a voyage at regular speed could be calculated rather exactly. Way stations (σταθμοί) were located at one day's distance from each other; the absolute distance varied according to the terrain. Herodotus' description yields an assumed average distance of 24 km, archaeological data give distances between 16 km and 26 km. The number of way stations, in combination with length in parasangs, was used by both Herodotus and Xenophon to express distance or extent of a satrapy (Hdt. 5.52–53; 7.8.26; Xen. *Anab.* 2.2.6). Xenophon's account seems to have been informed by rather detailed information; although milestones (in some form) would appear a logical source, the existence of such indicators in the pre-Hellenistic era remains debated (Callieri and Bernard 1995; Tuplin 1997: pp. 404–417; Briant 1997: pp. 80–81; Rood 2010; Henkelman 2017: pp. 63–72).

An average daily distance was also at the basis of Herodotus' calculations of distances on water (4.86), notably those of the Pontic region, the Bosphorus, and Hellespont. Specific data were available for the Nile (Hdt. 2.7.9), giving an idea of the extent of Egypt. Strabo's specifications on the length of the Nile (17.1.2 [C 785/86]; cf. 1.24 [C 804]) and the Egyptian seaboard (17.1.14 [C 798/99]) are based on the same system of calculation, as is his description of Mesopotamia by distances between stations on the Euphrates (16.1.22 [C 746]; cf. 15.1.11–12 [C 689] on the Indus and the Ganges).

The expression of longer distances as a function of average daily travel in turn fed into a perception of surface areas of provinces or regions. In this, the form of an area was adjusted to a regular geometrical figure, the sides of which were determined by measurements won from coastlines, rivers, or roads dissecting the region (Strabo 2.1.23 [C 78–79]; cf. 2.1.11 [C 71]). The method is clearly illustrated in Strabo's specifications on the *Ariane*. Starting point for the west–east axis is the Caspian Gates. The road leading east from there forks in Areia, near the city of Alexandria. One branch of the road leads to Bactria, continuing over the Hindu Kush to Ortospana in Paropamisus; the other one runs via Prophthasia in Drangiana to the Indian border. Strabo states that taking the second branch into account yields a considerably higher expanse for Ariane (15.2.8 [C 723/24]; cf. 11.8.9 [C 514]).

From descriptions of the campaign of Alexander it becomes evident that the communication routes constructed and maintained by the Achaemenids at the same time defined the known world (cf. Strabo 2.1.6 [C 70]). In the Panğāb, opened up by roads and especially by navigable rivers, Alexander reached the eastern border of the province Sattagydia, marked by the Hyphasis, the eastern boundary of the empire. The space beyond it was uncharted and the object of fantastic reports already in the Persian period (Ctes. *Ind.*). Tales about mighty kings, enormous armies, giant rivers, endless deserts, und invincible

war elephants abounded (Curt. 9.2.2–12; Plut. *Alex.* 62.1–2; Diod. 17.93.2–3). To ward off such dangers, altars and oversize *klinae* were erected by the Macedonians, monuments marking the end of a connected, integrated world and holding back the mighty adversaries living in the disparate and terrible chaos of the Unknown (Jacobs 1994: pp. 270–272).

Both deal with the roads crossing the Persian heartland.

CHAPTER 54

The Interplay of Languages and Communication

Jean-Jacques Glassner

Conceived as a mean of communication, language is the instrument of social life through which men inform themselves and influence each other, according to the structure of the group to which they belong. The Achaemenid Empire was a patchwork of peoples and languages. Twenty-three centuries later, the abbot Grégoire and the French Revolution invented the concept of a nation speaking one language only; with the imperative of a unique language in public acts, regional cultures were put away into marginality. When Rome was achieving its conquest, Italy was divided into small states with their own languages and writings. They were dominated by aristocratic elites in competition. With Latinization, those elites were attracted by the victor on the side of whom they hoped to carry their ambitions. At the end of the eighth century BCE, Sargon II of Assyria reminded one of his governors who had written to him in Aramean of the existence of an obligation imposing the use of Assyrian and cuneiform when writing to the king.

Compared with such proceedings, the Achaemenid Empire stands as an isolated figure. Multilingualism was the rule, even if the king and his entourage were content with Old Persian. As to the administration, all over the empire it made massive use of Aramean, as did the Assyrians and the Babylonians earlier. This unicity of administrative language, however, did not imply the disappearance of local languages, which had sometimes been those of great peoples and kingdoms. They continued to be used in private texts, the power deliberately favoring this linguistic disparity.

Mixing of Populations, Mixing of Languages

The Achaemenid Empire encouraged the circulation of men, services, and information. The result was a development of intercommunications between languages. The royal protocols, with the title “king of all the languages” (DSe, babylonian version), echoed this attitude.

Enterprising great works, the new masters continued the policy of transfers of populations started by the Assyrians and Babylonians. As is well known, since the Neobabylonian time, deported Judeans lived in Babylonia; the archives about them were written in Babylonian; as in the case of the Judean soldiers in Elephantine, one may infer that they had lost the use of their own language to the benefit of Aramean.

The provinces of the empire were also sprinkled with military establishments in which cohabitated contingents from various horizons. Two examples illustrate this. In Elephantine, in Egypt, a contingent of soldiers from various provinces was stationed whose commander came from Asia Minor (Grelot 1972). In Babylonia, not far from Nippur and Borsippa, some establishments were peopled with Carians from Egypt, with wives and children (Waezeggars 2006).

The mixing up of populations added to the complexity of linguistic situations. At Daskyleion, the court of the governor of Hellespontic Phrygia was opened to Greek influences, as attested by the wedding between the governor Artabazus and a Rhodian woman. One of the daughters of that same governor received a Greek education (Briant 1996: pp. 718–720). As for the Greeks settled into the empire, they were not all craftsmen, workers, or mercenaries, some were landowners, as in Babylonia.

Finally, an Iranian aristocracy in charge of high administrative functions was omnipresent in all the provinces. In Asia Minor, the traces of a Persian diaspora are to be found until the late Roman Empire, as testified, for example, by an epitaph in Greek language invoking “the gods of the Greek and the Persians” for the protection of a tomb. In Babylonia, the number of Iranians present in the land never ceased to increase. There, as elsewhere, marriage between members of local social elites and Persian administrators resulted in a certain acculturation of one or the other.

To sum up, the empire formed a patchwork of heterogeneous populations. These intermixings were not without consequences for the linguistic state of the provinces. As the sources stand, a global approach of the question is unconceivable, however. First of all, there is no archeological or even scientific evidence. Second, the pieces of information are spread unevenly throughout the empire.

Anthroponymy is, at this point, a source of primary importance. Only through anthroponymy can the presence of foreign populations in a given group be made visible. In Babylonia, as in Egypt, we note the adoption of

Iranian names by local populations, as well as the use of a double name, local and Iranian. The growing integration of Babylonia into the imperial administration is marked by an increasing number of Persian names. In Susa, the last governor, Abulites, had a Babylonian name, whereas his son was called Oxathres, a Persian name. The Carians of Borsippa, beside their one onomasticon, also had adopted Egyptian, Aramean, and Aramaized Babylonian names. In Asia Minor, mainly in Cappadocia, Armenia, Commagene, and Pontus, the numerous Iranian onomasticons testify to a deep Iranization. In Egypt, some documents from Elephantine show the names and patronyms of the scribes who wrote them: they are Persian, Judean, Syrian, Egyptian, or Babylonian. In the court of the governor Aršāma, some of the staff bore Egyptian or Cilician names; but it was always possible for an Iranian to bear a second Egyptian name or to give such names to his children. Thus, everywhere, the sources give evidence of the mixing of populations.

We must point out, though, about the misuse of the testimony of anthroponymy. Indeed, we know that there doesn't necessarily exist a simple and univocal relation between the onomasticon of a human group and its language. On the contrary, discrepancy is the rule; a plurality of groups can adopt one single anthroponymy or, conversely, a same group can adopt several different anthroponimies.

This mixing up also had consequences for the languages which were sometimes receptive to extraneous influences. For the classical authors, all the populations of the Iranian plateau used to speak Persian with slight dialectal variations. In fact, there were a more or less important number of Iranian languages, but only Old Persian and Avestic came to us directly (Fussman et al. 2005). The Old Persian of the Achaemenid sovereigns was not only a court language spoken by the kings, it was used, too, within the administration. Now, Old Persian is not without borrowing from other Iranian languages, notably Median; the word "king" itself, *xšāyathiya*, instead of the **xšāyašiya* expected, is a possible example. We may also find a Mesopotamian influence in the title "king of kings," *xšāyathiya xšāyathiyānām*, the genitive following the determining in the way of Assyrian inscriptions, instead of preceding it, as is expected in Iranian languages. Looking at it in another way, its phonetics being specific, one may question whether it was under Elamite influence. In the Persepolis tablets, some formulas are inspired by Aramean models.

Paradoxically, in the provinces, Old Persian did not appear except in royal inscriptions and some minor legends. Nevertheless, its discrete presence appears in words borrowed by local languages. The Persian Bagasarû, for example, holder of a charge of treasurer in Babylonia, was first conferred the Babylonian title *rab kāsir* before the Persian one of **ganzabara*.

Elamite was still a living language. Although most of the evidence comes from Persepolis and Susa, the discovery of tablets similar to those from Persepolis at Armavir-blur in Armenia should be noted. Elamite was then strongly Aryanized, as testified by the numerous borrowings from the Old Persian vocabulary and the adoption of attributive constructions which follow the old Persian formulas. It also lost its former nominal structure, its syntax undergoing some modifications. Everybody agrees today to see in the meeting between Elamite and Iranian populations a remarkable case of acculturation in the course of ethnogenesis (Henkelman 2008).

Babylonian, which was the third official language in the empire, after Old Persian and Elamite, was still a written language in Mesopotamia and Susa, but we don't know whether it was still spoken, even in Babylon. Its lexicon was enriched with Aramean and Iranian borrowings.

Aramean was spoken in Syria, Palestine, Babylonia, and probably in Cilicia; in Tarsis, the coin legends were written in Aramean; in the other provinces of Asia Minor, the legends alternated between this language, Greek, and local languages. In Samaria, they were generally in Aramean, but some of them were in Greek, Phoenician, sometimes in Assyrian and cuneiform. Elsewhere, Aramean was used only in the context of provincial administration. Strangely enough, it was not used in monumental royal inscriptions. It is noticeable that it remained the same in its principle from the Mediterranean sea to Bactriana, with traces everywhere of the influence of Iranian languages from which it borrowed quite a number of words. Nevertheless, some significant differences deserve to be underlined between western and eastern dialects (Folmer 1995).

As a matter of interest, Egyptian hieroglyphs were in use to note down the Achaemenid royal inscriptions in Egypt itself.

Greek was equally a provincial language, although Herodotus mentions that Darius I had two stelas engraved on the shores of the Bosphorus, one in Assyrian, the other in Greek. It is mainly documented in Asia Minor whose linguistic situation was one of remarkable complexity. Each province had its own language and sometimes its own writing. We find there a relatively important number of bilingual (lydo-aramean; graeco-lycian; graeco-aramean) or trilingual (graeco-lycian-aramean) documents. Ionien is present in two documents, one from Sardis, the other from Persepolis. Attic influence is strongly marked in Xanthos.

At this point of our inquiry, the existence of regular relations between communities speaking different languages brought about a creation of a few mixed languages, more or less impregnated by exogenous vocabularies and allowing direct communication without the need for translation. We think of the imperial Aramean and of the Achaemenid Elamite, to a less degree of Babylonian, the vocabularies of which were more or less contaminated by Old Persian or by other Iranian languages. But we can't ignore the fact that written

documentation noted down on leather and papyrus, except in Egypt, is lost. And we don't know the place of Old Persian as a spoken language.

The Art of Translation

Beyond the contact between languages, exchanges between men required the help of translation. Xenophon mentions the presence of numerous interpreters in the royal army. Obviously, with a few exceptions, neither the kings nor the Persian high dignitaries learned languages other than their own, which made the intervention of interpreters even more essential. We know of no one, except Themistocles, a refugee with the Great King, who ever learned Persian.

The documentation discovered at Persepolis provides a good image of the empire; it is multilingual and this is its distinctive mark. Two groups of texts prevail in numbers: those written in Elamite and those in Aramean. Both groups were found mixed up and the links fastening them together show that they were one single archive. There are also Elamite documents annotated in Aramean; more rarely, Aramean documents bear Aramean annotations. As a matter of interest, the scribes used to write in Elamite texts that were dictated in Persian. Two Aramean texts were written by non-Aramaic-speaking scribes, as established by their Elamite spelling. Finally, one text in Greek, another in Phrygian, a third in Old Persian testify to the existence, otherwise lost, of archives in these languages. Two Babylonian documents show the presence of a Babylonian population in Persepolis.

We may infer from those observations that the scribes in Persepolis mastered several languages. Quite a number of them had Iranian names, but some Babylonians possibly adopted Iranian names. Similarly, Aramean scribes may have adopted Iranian names, and perhaps even some Iranians could have learned Aramean.

The Elamite word *teppir* alluded to the function of scribe. In Achaemenid times it corresponded to the Akkadian *sepīru*, itself a borrowing from the Aramean *spr*, a title which referred to a bilingual or multilingual scribe.

Aramean was the only vehicle in the imperial administration outside Persepolis. However, due to its wide distribution it reduced the multilinguism in its width – it served as a mediator between the conquerors' language and the languages that were used locally. The unity of the empire was ensured by Iranian dignitaries in charge of the higher administrative posts in the provinces, while subsidiary posts fell to local administrators. The contact between these levels made interpreters particularly important.

We possess ample evidence of this in Asia Minor, Babylonia, Phoenicia, or Persepolis itself. Here are a few examples. The Egyptian compendium of case laws requested by Darius I was written in Demotic and Aramean (Briant

1996: pp. 972–973). In Babylonia, a slave's wrist had an Akkadian and an Aramean inscription. A Babylonian tablet mentions Iranian officials and their interpreters, *sepīru*, all bearing Babylonian names. When Persian peoples addressed Egyptians, they did so in Aramean, whether in administrative or private matters. However, three papyri were found that bear evidence of an exchange of mail in Demotic between the governor Pherendates and the people in charge of the Khnūm sanctuary in Elephantine (Hughes 1984). It has been convincingly demonstrated that the letters sent by the governor were translated from Aramean into Demotic by an Egyptian scribe. But the bad-quality Demotic version smells of translation as the scribe translated word for word. On the contrary, the answer was directly written in Demotic. As for the transmission of orders, the Aršāma archives allow us to discern three actors in concert: one transmitted the order, the second translated it into Demotic, the third noted it down, the Demotic translation proving that the addressee didn't know Aramean. As a matter of interest, we discover in some Egyptian sources a sort of transliteration of Persian titles into Demotic through Aramean; a scribe with an Iranian name could, occasionally, write in Demotic.

A group of documents in Aramean coming from Bactriana (Shaked 2004) comprises eight letters from Akhvamazdā, the governor of the province, to Bagavant, a city governor. Both sender and addressee were Persians. They therefore wrote in a language of which they were ignorant. Hence, they could not manage without the help of bilingual scribes used to simultaneous translation from Old Persian into Aramean. But their Aramean was of poor quality. Now, the scribes had Persian names and one, at least, originated from Bactriana. Two hypotheses present themselves: they must have learned written Aramean and epistolary style at school, or they were helped by second-rank Aramean-speaking scribes.

A stela discovered in Xanthos (Metzger et al. 1979; Blomqvist 1982; Kottsieper 2002), Lycia, presenting a trilingual inscription, in Lycian, Greek, and Aramaic, shows the undoubted vivacity of local languages in Achaemenid times. The text informs us about the modalities of a cult rendered to a Carian god, the "King of Kaunos," and his acolyte, Arkesimas. It is not a true trilingual, since, if the Lycian and Greek versions form a true bilingual, the Aramean one, with its numerous borrowings from Old Persian, differs totally.

The Lycian and Greek versions are identical, the second being a translation of the first one into an atticizing and elegant language, with one or two marks of doric; some particularities, however, are understandable only through Lycian influence. The two versions were meant for populations of local language and Greek culture. The Lycian *xssathrapaza*, "governor," is built on a word borrowed from the Persian *xssadrapa*. Unlike those two versions, the Aramean one shows many errors; besides, the lapicide knew Aramean, but imperfectly. The onomastic is Lycian, Carian, Greek, and Persian. When

dealing with the Carian names of the gods, the Lycian version transliterates that of “King of Kaunos,” the Greek one translates it, the Aramean transliterates consonant after consonant; as to the second name, the Lycian version adapts it, the Greek one gives a Hellenized transliteration, the Aramean offers the translation “the Companions.”

The quality of the translation could thus change according to the level of complexity of the language, but also according to the talent of the translator. As a general rule, the bi- or trilingual inscriptions weren’t as elegant as that of Xanthos. At Sardis, for example, Graeco-Aramaic or Lydo-Aramaic bilingual inscriptions testify to the difficulties met by the translators in passing from one language to another (Robert 1975).

In the courtly sphere, on the contrary, translation was not handicapped by the reproduction in the target language of syntactic structures specific to the original language. Such is the case of the Bisotun trilingual (Grillot-Susini et al. 1993; Schmitt 1991; Malbran-Labat 1994).

The commentators did not fail to see that for the sovereign it was the means to legitimate his power through the assertion of his 19 victories in a single year against nine rebel kings and his devotion to Ahuramazdā. For the text was a foundation charter of the Achaemenid monarchy, as were in Mesopotamia the accounts of the nine victories that Narām-Sîn of Akkade boasted to have enjoyed in a single year over three rebel kings, or later the story of the battle of Bouvines for the French Capetian monarchy. It could also be seen as an old Indo-Iranian ritual which submitted the monarch’s legitimacy to a one-year period. As a further element of external influence the abovementioned design of the titulature according to the Assyrian model can be valued. It is easy to understand the monarch’s wish to display his decisions to his subjects on the face of a cliff through monumental writing carried out with elegant affectation.

According to archeologists, the three versions of the inscription must have been engraved successively: the Elamite first, on the right of the bas relief, the Akkadian second, on its left-hand side, and finally the Old Persian underneath the bas relief. In between, the bas relief had been increased at the expense of the Elamite text, which was copied on the left of the Old Persian version. To the four columns of the Old Persian version itself a fifth has been added to complement more recent events.

There are arguments, flimsy no doubt, that lead us to doubt such reconstruction. Didn’t Darius call himself a speaker of Iranian? The similarities between the three versions imply that they must have been composed after a single model, which could only be the Old Persian version itself: Didn’t the king and his chancellery speak this language only? Of course, the three versions are not a mechanical copy of each other. The translators created a free and flexible paraphrase, respectful of the syntax and the turns specific to each language, attached not so much to the words as to the meanings.

If the presence in the Elamite version of Elamized Old Persian words is not surprising, such is not the case of Old Persian *pattikara* (§ 53) in apposition to an Elamite word, as if, in order to be more fully understood, it needed to be clarified by Persian. Similarly, the phrase *dayauišmi tarma ašdu* (Elamite version § 44; Old Persian version § 55) can be considered as the transliteration of an Old Persian sentence present in the original available to the author of the Elamite version, but there is no certainty there. One may as well understand the sentence as an Elamite phrase which words were borrowed from the Old Persian.

We are not yet in a position to fully measure the extent of the reciprocal influences between Achaemenid Elamite and Old Persian. However, a new perusal of the last paragraph of the Elamite version (Elamite version § 55; Old Persian version § 70) dismisses the idea of any translation from Elamite into Old Persian; we understand: “I have produced differently the text in aryan, which it was not before, on clay and leather.” This paragraph deals only with the question of the diffusion of the message. Thus the Elamite version is no more the first written version and the Old Persian version is no more a translation of it.

The Babylonian version often departs from the other two versions. We can discern conservatism. Certain toponyms and ethnonyms are designated by words with which they had been registered by Assyrian and Babylonian scribal traditions. The royal titlature also shows the impact of local habits, the Achaemenid ruler holding the Babylonian titlature in the same way as he holds the Egyptian one in Egypt. As for the rest, discarded by the other versions, the Babylonian one quantifies the number of dead and prisoners at the end of each paragraph; it sometimes adds a few extra bits of information, mainly about events concerning Babylonia. Such additional pieces of information lead us to think that the author had access to complementary sources.

Darius’ order was not ineffective: his inscription was copied and diffused all over the empire. A stela of which some fragments remain was dispatched in Babylon. The inscription in Babylonian language was associated with a relief which, apart from Gaumāta as Darius I’s opponent, showed only two Babylonian rebels and on which the king was not facing Ahuramazdā but the Babylonian celestial triad. In the text, the name of Ahuramazdā was replaced by that of Bēl, that is to say Marduk (Seidl 1999). The fragments of an Aramean translation were found on the Elephantine island (Greenfield and Porten 1982; Tavernier 2001). It represents strong affinities with the Babylonian version, even if this is not its direct source, comparison with the Bisotūn and Babylon versions showing a proximity to one or to the other in turns. Besides, it contains elements coming from the inscription on Darius’ tomb at Naqš-i Rostam.

Conclusion

Multilingualism and cosmopolitanism were the distinctive features of the Achaemenid Empire, its domination making use of this paradox that consisted in a superficial linguistic unification (such was the role of Aramean) and the maintenance of a diversity with the preserving of local languages. Was the result a society whose members could read and write two or several languages? First of all, it is most likely that if those languages were in use at the same time, they must have had complementary functions, the speakers using them in specific situations. We must distinguish between a true bilingualism or multilingualism, the use of languages with an identical cultural status, and the diglossy, the use of languages culturally hierarchized. In other words, a person is said to be bilingual or multilingual if they possess several languages as mother tongues; this situation is to be distinguished from that in which one language only is a mother tongue, the other(s) being learned at school. The interesting problem is then to know to which extent multilingualism influences the knowledge of each of the concerned languages. From that point of view, it is not without interest to note that in Persepolis all the Elamite-speaking scribes did not use Achaemenid Elamite, which had integrated quite a number of Old Persian or Iranian words, but wrote a language devoid of any borrowing, even in its syntax (Henkelman 2008).

The fundamental linguistic problem concerning multilingualism in Achaemenid times is to know to which extent languages in contact can remain intact and to which degree they can have influenced each other. Obviously, there were reciprocal influences between Elamite and Old Persian, for instance; there must also have been cases where the separation persisted.

CHAPTER 55

Achaemenid Art – Art in the Achaemenid Empire

Bruno Jacobs

The following remarks focus on examples of large-scale representational art that can be connected directly with the Achaemenid dynasty and are therefore given the label “court art.” Their connection with the dynasty is established by inscriptions: these were normally commissioned by the ruling monarch (or on occasion by his designated successor) and were either placed directly on the artworks themselves or on the buildings that they decorated. To this core group one may add certain other items that are linked with it stylistically.

Achaemenid court art presents itself mainly in the form of architectural sculpture, particularly as a way of decorating stairway facades, the staircases themselves and the reveals of doors, gates, and windows. Interior and exterior walls could also be adorned by (at least) glazed brick panels and wall paintings (Glazed bricks: Daucé 2010: pp. 334–342.¹ Wall paintings: Boucharlat 2010: pp. 402–403; Fig. 466–469). In addition there are a number of rock reliefs, the famous torso from Susa (Yoyotte 2010; *here* Figure 94.8) and some other statue-fragments (Luschey 1983 with pl. 16–19), animal sculptures (Calmeyer 1995–1996), and a couple of stelae (Roaf 1974: pp. 79–84 Fig. a–d; Lloyd 2007: pp. 99–107 Fig. 2–3; *here* Figure 20.1). The thematic repertoire of the reliefs comprises representations of the king followed by servants, the ruler giving audience (Figure 55.1), delegations from imperial provinces

Figure 55.1 Persepolis, Apadana-Osttreppe, Delegation 2, Detail (DAI Abt. Teheran, W Neg. KB 63-28. Source: Reproduced by permission of the German Archaeological Institute).

(Figure 55.2), throne-bearers (who also represent these provinces) (Figure 55.3), a Royal Hero fighting wild beasts and hybrid creatures (Figure 55.4), soldiers (Figure 94.7), officials (Figures 55.5 and 94.6) and servants (Figure 55.6). On the facades of the royal rock-cut tombs we see a dais carried by provincial representatives, on which the ruler stands in front of an altar and renders homage to Auramazda (Figures 87.2 and 94.4; on the interpretation of this scene see Jacobs 2006: p. 219; cf. lastly Garrison 2011: pp. 40–65). Also deserving of special mention is the Bisotun relief: here Darius I, followed by two secondary figures, is shown as the victor over Gaumāta and those chieftains who, at the beginning of his reign, either tried to make themselves independent or sought to overthrow him (Luschey 1968; *here* Figure 55.7).

Except for the Bisotun relief, the monuments with which we are concerned are largely confined to the main residences of the Achaemenid empire (Susa and Babylon, Persepolis and Pasargadae: see Chapter 70 The Residences), and a couple of royal roadhouses in the heartland.² Only a few monuments once stood outside this central area, namely the statue of Darius and the Suez stelae in Egypt³ and two reliefs in Rough Cilicia (Davesne 1998) that are (because of the state of publication) difficult to assess. The best known of the Egyptian items, the statue of Darius found at Susa in 1972 (Figure 94.8), was in the end not left in the province, but “repatriated,” thus reducing the already small

Figure 55.2 Persepolis, Apadana-Osttreppe, Delegation 16-18 (D-DAI-EUR-TEH1964-0262. Source: Reproduced by permission of the German Archaeological Institute).

number of exceptions to the general rule. The way that Achaemenid art is largely confined to the central provinces Pārsa, Māda and Ūḡa and to Bābiruš prompts questions about the communicative function of the sculptures – and doubt about the propagandistic impact so often imputed to them. The term *propaganda* is inappropriate even in the Roman Republican or Imperial periods (Dally 2007: pp. 252–253, with further references in n. 109), and this is all the more true for earlier periods. For this reason the term “communication” will be used instead in what follows.

Top-down-communication is indispensable for the coherence of any state entity. That Achaemenid art, despite its geographical and thematic limitations, is widely regarded as a central medium for such communication is due to a (supposed) analogy with the central role of images as a communicative medium in Greek *poleis* and the Roman Empire as well as to the lack of sources documenting alternative modes of communication (see Chapter 53 Roads and Communication). In addition, the rich repertoire of pictorial art

Figure 55.3 Persepolis, East gate of Tripylon, Ruler with throne bearers. Source: Photo B. Jacobs.

encountered at the western periphery of the Achaemenid empire, especially along the Aegean and east Mediterranean coasts, is often interpreted as proof that communication between the center of the empire and the remotest provinces was effected by these media. A central argument for this proposition is that topics are preferred in this area that hardly occur in the arts of mainland Greece, i.e. non-mythical hunts and fights, city-sieges, and courtly meals. The choice of these topics and certain provincial stylistic elements are attributed to Achaemenid impact, and on this basis an empire-wide communication via images has been “reconstructed” – the assumption often being made that the topics in question once existed in Achaemenid court art and simply happen not to occur in what survives to the present day (on this cf. Jacobs 2002: pp. 345–352).

Before we deal with the problem of the choice of subject matter, it must be stressed that in the Achaemenid period representational art was never an across-the-board phenomenon that reached all parts of the empire. In fact, it

was limited – at least according to the present state of knowledge – to the coastal areas of Asia Minor, Lydia and Phrygia, the Levant and Egypt, Babylonia and Elam, the Persian core area, and the province of Sistan.⁴ But these are all regions in which representational art had already existed in pre-Achaemenid times for centuries or even millennia. Nowhere was there a new

beginning in Achaemenid times. Provinces where representational art did not exist at the start of Achaemenid rule remained pictureless, and this is the situation in by far the greater part of the empire. There is, therefore, little sign that the Achaemenids deliberately set about disseminating representational art outside the imperial core area,⁵ and the salient monuments in Asia Minor cannot be regarded as exemplifying efforts to do any such thing (Jacobs 2002, 2014b, 2015b).

From the outset, therefore, we should regard Achaemenid court art and representational art in the provinces as mutually independent phenomena. If we begin with court art and focus attention on communication, questions arise immediately about the content and the intended audience of the messages it contains. Responses to these questions display a persistent tendency to take the Bisotun relief (Figure 55.7) as a starting point and to regard it as paradigmatic of the intentions of Achaemenid court art as a whole. But this involves ignoring the exceptional character of this monument – something that in other contexts is frequently stressed. It came into existence because the person who commissioned it was under huge pressure to establish his legitimacy, and Section 70 of the Old Persian text (and the corresponding passage in the Elamite version) famously indicates that its textual content was circulated across the empire: “Both on clay and on parchment it (*scil.* the text) has been placed ... Afterwards I have sent this text into the countries”. The existence of copies from Babylon (Seidl 1999) and Elephantine (Greenfield and Porten 1982), and the closeness of Herodotus’ narrative to Darius’ version of the same events, bear witness to this circulation.

This already suggests that the problems of Achaemenid pictorial art cannot be assessed independently of the inscriptions that are closely connected with it and, so far as dissemination is concerned, apparently followed the same impulses. Copies of heartland Achaemenid inscriptions have only rarely been found elsewhere within the empire.⁶ Once the greatest threat to Darius (the upheavals of his first regnal year) had been averted, inscriptions soon began to be divested of their circumstantiality. Initially historical events were still recapitulated in a summary manner, as in § 71–76 of the Bisotun inscription. Then there are a few instances in which such events are referred to in ways that barely give any idea of what actually happened (Jacobs 2014a). And finally they disappear altogether. Fact-rich inscriptions like DSf and DSaa are found only in the early years of Darius. In later texts, with the exception of genealogical data about the royal family, personal names are dispensed with, while toponyms also become rare and finally disappear: the last original list of provinces (XPh §3) occurs as early as the reign of Xerxes. In a similar fashion, pictorial art after Bisotun limits itself to the topics listed at the start of this chapter, and these are topics that are not well designed to convey complex messages.

For this reason people have looked for interpretations that work indirectly or on the basis of treating the monuments as an ensemble. The fact that in Achaemenid art – by contrast with the Assyrian reliefs with which it is frequently compared – representations of war and death are absent has been interpreted as an expression (or at least a vision) of harmonious co-existence, i.e. as the image of a *pax Persica* (Root 1979: pp. 309–311; Brosius 2005). The reliefs showing representatives of the imperial provinces carrying the king on a throne (Figures 55.3 and 94.4) have been understood as depictions of voluntary co-operation in the common interest (Calmeyer 1991: pp. 288–289). And the constant recurrence of the same topics has been taken to convey the message that Achaemenid rule was immovable and everlasting (Root 1979: p. 310).

That this last interpretation cannot be correct is easy to demonstrate. Not only is the effort entailed in conveying such a trite message by continuous repetition disproportionate, but the message would in any case have been impossible to understand as long as replications of the various topics did not (yet) exist. Only quite late in the fifth century would this deeper meaning have gradually come to light. This is a wholly implausible view.

As for the inclination to understand the monuments as a vision of imperial peace and voluntary co-operation, this is connected with the highly problematic supposition that the Achaemenids were bound by a higher moral code than their historical predecessors, the Assyrians and Babylonians. But one has to wonder if it really makes sense to keep on separating political vision from historical reality in this way. The ethical differences which are envisaged especially with respect to the Assyrians blur noticeably as soon as one (i) realizes that the picture of the Assyrian king as a merciless judge and wanton destroyer is also an ideological product and one that reflects reality in a similarly restricted manner, and (ii) pays attention to sources describing the considerable violence used by the Achaemenids to subdue opponents or deal with separatists and dissidents. Especially where punishment is concerned, the Achaemenids employed methods that were no less cruel than those of the Assyrians, and in the Bisotun text Darius was perfectly happy to give an account of such methods (Jacobs 2009: pp. 128–129, 151–152). So a different and more plausible explanation of the evidence seems to be required.

This explanation starts from the trio of legitimation strategies pursued by the Achaemenid rulers as described by G. Ahn, that is: divine and dynastic legitimation and legitimation by accomplishment (Ahn 1992: esp. pp. 89–91). At Bisotun Darius I used all three strategies, not least because his dynastic legitimacy was fragile and his rule insecure. It is plain, however, that the third of them soon lost ground in favor of legitimation by Auramazda. This meant that the ruler's achievements in his human environment gradually became unimportant and not worth either describing or depicting (Jacobs 2014a).⁷

Next, one has to realize that inscriptions and pictures were not addressed to the king's subjects. As has frequently been noticed, reliefs were usually installed in places that were not accessible to the common people, whether in the citadel of Persepolis (Figure 70.2), on the door-jambs of palaces in the middle of the royal paradeisos at Pasargadae (Figures 15.1, 55.8, 94.1, and 94.2), inside the palaces at Susa (Figure 15.5) or high above the ground on the rocks of Bisotun and Naqsh-e Rostam (Figure 87.2). The same is at least equally true of Achaemenid inscriptions. A large proportion of those known to us were foundation texts and, as such, were buried or enclosed in deposits, i.e. were inaccessible. Numerous inscriptions were installed high above the ground, whether on the towers of the so-called Apadana (see the reconstruction in Krefter 1971: Beil. 4.5.7.25.26; *here* Figure 55.9), on the *Gateway of All Lands* (Schmidt 1953: Pl. 9.14) or the southern wall of the Persepolis terrace (Tilia 1978: pl. 2 Fig. 9), and so were barely visible and certainly not legible (Jacobs 2012: pp. 96–97, Fig. 2–4). Precisely those inscriptions which, because of their complex content, could be regarded as of especially great communicative value, i.e. the inscriptions DB and DNb, explicitly name successors to the royal throne as their primary addressees and thus demonstrate that they only targeted a wider public in a very limited way. In the Bisotun inscription one reads:

Figure 55.8 Pasargadae, Palace P, relief on door jamb (DAI Abt. Teheran, Neg. R-1988-701 Source: Photo B. Grunewald; reproduced by permission of the German Archaeological Institute).

Figure 55.9 Persepolis, Reconstruction of Apadana and Tripylon (Krefter 1971, Beil. 26; Source: Reproduced by permission of German Archaeological Institute).

(§64) *Proclaims Darius, the king: You, whosoever shall be king hereafter – the man who shall be a follower of Falsehood, or (the man) who shall be an evil-doer, to those may you not be friendly, (but) punish them severely.* (§65) *Proclaims Darius, the king: You, whosoever hereafter shall look at this inscription, which I have written down, or these sculptures, do not destroy (them); as long as you shall be vigorous, thus care for them!* (transl. Schmitt 1991, p. 71)

In addressing the “young man” the inscription DNb also speaks to an heir apparent:

(§3a) *O young man, very much make known of what kind you are, of what kind (are) your skills, of what kind (is) your conduct! ...* (§3b) *O young man, let not that seem good to you, which the ... does; what the weak does – observe that too! O young man, do not set yourself against the ...* (transl. Schmitt 2000, p. 41)

It has already been noted that, where dissemination is concerned, the images of Achaemenid court art followed the same impulses as inscriptions. It follows that they were also directed at successors to the throne more than at a wider public. Consequently there is no good reason to think that what we see in pictorial art was intended to override or deny reality. The images are not peaceable, but undramatic, and they edit out testing situations like war

or hunting because legitimation of the rulers by these activities was not their objective. Instead their real theme is represented by those essential pillars of the exercise of power, the soldiers and the elite officials. The empire itself is present in the shape of the delegations and throne-bearers who stand for imperial provinces. The relationship with the world of the gods is represented by the repeated face-to-face meeting of god and ruler and their general iconographic assimilation one with another (Jacobs 2017; *here* Figures 55.7 and 94.4). It is a relationship that is best reflected by a phrase in the inscription DSk §2: “Auramazda (is) mine, I am Auramazda’s.” The god impacts on the world through the king and, to judge by the inscriptions, had already become the real maker of political decisions quite early in Darius’ reign: for he decided conflicts (DNa §4; DSe §5) and settled the succession to the throne (XPf §4) (Jacobs 2014a).

The corpus of representational art in the provinces offers an entirely different picture. In contrast to the Persian heartland pictorial art here is found mainly in sepulchral contexts. In the iconography of the central topics (hunting, combat, city-siege, and banquet) there is always a protagonist who can confidently be identified as the deceased. Hence legitimation by achievement was definitely intended, even if in an idealized form. So, simply in terms of ideological intention, these images are certainly independent of Achaemenid prototypes, because the latter would have been unsuited to their purpose.

Nevertheless, the predilection for the topics of war, hunt, and banquet observable in all the relevant western provinces (Hellespontine Phrygia, Paphlagonia, Lydia, Lycia, Caria, Greater Phrygia, Cilicia, and Phoenicia) does call for an explanation. Among war-scenes it has been suggested that the visually striking theme of city-siege (particularly popular in Lycia) derived from Assyrian models (Childs 1978). But quite apart from the fact that the putative prototypes would hardly have been accessible, the typological development of Lycian art makes iconographic dependence of this sort impossible (Jacobs 1987: pp. 61–64). What Assyrians and Lycians did share with one another was the perception that, for a member of the social elite, hunting, battle, and banqueting were of central significance, the first two as moments to prove oneself and the third as a way of demonstrating one’s social position (Figure 43.3). This view was also shared by the Achaemenids, and indeed probably by the whole imperial elite, but only small parts of that elite demonstrated it by having the relevant subjects converted into pictorial art, especially in the furnishing of their grave monuments. At the western periphery of the empire the process involved local adaptation of Greek artistic forms, with the consequence that the monuments can be classified and dated by stylistic criteria developed from Greek art. The close contact between various regions that resulted from common affiliation to the Achaemenid empire led to an intensive exchange of ideas, and the eventual result was that similar pictorial themes

appeared all over the place. What this shows is consensus among elites, not the propagandistic impact of the Achaemenid court (Jacobs 2014b).

The thematic convergence of monuments from Asia Minor and Phoenicia that resulted from this consensus can be illustrated very clearly in a series of processions which have in common the presence of a vehicle whose superstructure is difficult to understand and whose function is debated. Sometimes the superstructure looks like a wooden framework covered with fabric, sometimes like a chest with a rounded top. Some scholars are of the view that the object is a sarcophagus, others think that we are dealing with a canopy under which we are to imagine a woman or someone or something else that had to be sheltered from public view. But, whatever the function of these vehicles, the processions as a whole resemble one another so closely that they cannot have come into existence independently. (An overview of the images appears in Summerer 2007b: pp. 138–141 fig. 6, and a summary of proposed interpretations in Summerer 2007b: pp. 139–141).

The claim that battle, hunt, and banquet scenes in the western provinces were created independently of putative prototypes in Achaemenid art cannot be rejected just because some elements are doubtless dependent on Achaemenid models. The relationship of audience scenes to Persepolitan prototypes is open to discussion in certain cases, e.g. the reception scene on the eastern front of the Harpy Tomb at Xanthos (London, Brit. Mus., BM 287: Gabelmann 1984: no. 15 pl. 5,2; Jacobs 1987: pl. 6,2), the audience scene in the second frieze of the Nereid Monument at Xanthos (London, Brit. Mus., BM 879: Gabelmann 1984: no. 16a pl. 6,1; Jacobs 1987: pl. 6,3) or the eponymous scene on the Satrap Sarcophagus from Sidon (Istanbul, Arkeoloji Müzeleri: Gabelmann 1984: no. 22 pl. 9). In these instances the representation of an enthroned potentate, accompanied by two figures standing behind his throne, may be more or less heavily dependent on reliefs at Persepolis (Schmidt 1953: pl. 96–99, 119, 121–123; Gabelmann 1984: pl. 1; Jacobs 1987: pl. 6,1), but the similar appearance of the scenes in question could also be the product of a similarity of ceremonial. On the other hand, the audience scene on the Payawa Sarcophagus (London, Brit. Mus., BM 950, 7, and Antalya, Arch. Mus: Gabelmann 1984: no. 21 pl. 8; Jacobs 1987: pl. 7) is an indisputable case, because both here and at Persepolis the scene includes a figure who introduces others to the potentate (Jacobs 1987: p. 47). Even more indisputable is the well-known painting on the inner side of a shield carried by a soldier on side C of the Alexander Sarcophagus (Istanbul, Arkeoloji Müzeleri: von Graeve 1970: pp. 102–107 Pl. 34,1; 69; 70; 71,3). In both instances acquaintance with prototypes from Persepolis, whether the Treasury Reliefs or the audience scenes on the southern doors of the Hundred Column Hall, is beyond argument. The same may be true of the gift-bearers on the third frieze of the Nereid Monument (London, Brit. Mus., BM 895: Shahbazi

1975: p. 92 pl. LXIV; Jacobs 1987: p. 48 Taf. 8,1–2; Childs and Demargne 1989: pl. 124, 3; 125, 1. 3; LII; cf. Persepolis, Apadana stairway facades, delegation 9: Schmidt 1953: pl. 35). But borrowings of this kind are not the result of an initiative from the imperial center. On the contrary the urge to adapt generally comes from provincial elites themselves (Sommer 2005: pp. 145–146),⁸ and we are entitled to suppose that allusions such as the audience and gift-bearer scenes mentioned above or direct quotations like the image on the inside of a shield on the Alexander Sarcophagus reflect the initiative of local tomb-owners and were intended to express their loyalty to and approval of current political circumstances.

Members of the Iranian elite did come into contact (e.g. in Asia Minor) with this imagery, completely divergent as it was from that of the imperial centers in terms of ideology and audience. Yet it is hardly ever demonstrable that they exploited the possibilities that it offered: this may be because it really *was* rare for them to do so or (on the contrary) because they accepted those possibilities without reservation or adjustment, with the result that their monuments were barely, if at all, distinguishable from those of natives (Jacobs 2015a). The first alternative is perhaps favored by the monuments (mostly stelae) found in the vicinity of the satrapal residence at Dascylium which – despite over-hasty views to the contrary – can hardly ever be linked to Iranian members of the satrapal court (Lemaire 2001; Jacobs 2007: p. 24; 2015a). The second alternative can claim support from the Karaburun II tomb in the Milyas (Figure 43.3): here the grave owner is depicted at a banquet, dressed in what appears to be the court robe, a form of clothing well-known from Achaemenid court art (Figures 94.6–94.8), as well as from seals (Figures 21.6 and 56.1b) and coins (Figures 57.2–57.6), and one that is never worn by anyone who is certainly not a Persian, at least in a wider sense of that term. (On the definition of “Persian” cf. Henkelman 2011: pp. 582–614.) If Karaburun II is not to be declared as an exception, the tomb-owner should be identified as a Persian (Jacobs 1987: pp. 29–32), and the same will apply to the owner of the tomb at Tatarlı, who (if we are right to identify him as the protagonist in the battle scene) is depicted in the same robe (Jacobs 2014b; for illustrations see Summerer 2007a: Fig. I–III; on the robe see Chapter 74 Clothes and Insignia).

In both of these grave-monuments the pictorial decoration was on the inside, so one still cannot simply assume that it had a widespread impact. The same is true of sarcophagi arrayed in subterranean burial places as at Sidon or of reliefs installed high above the ground or overshadowed by the ceiling of a peristasis as on the Nereid Monument of Xanthos. In these cases communication with the gods, enhancement of the value of the monument and/or the performative character of the imagery may have been regarded as more important than communication with human spectators. Whether in the provinces or

in Achaemenid court art, one probably does most justice to monuments if one differentiates between those who could see the pictures and those who were supposed to see them (cf. Russell 1991: pp. 223–240, esp. p. 240). Nonetheless, to the extent that their decoration was placed on the outside and at a modest height, some provincial monuments did address a much wider “public” than the monuments of Achaemenid court art which, in the end, only members of the “inner court” had a chance of contemplating.

If we accept that the target audience was limited in this way, what are the consequences for our interpretation of the subject-matter of Achaemenid court art? On the one hand one should no longer start from the premise that complex messages and complete programs of government can be extracted from the images. Their purpose was to show the king in his central functions, as ruler over the empire (reflected by the provincial delegations), supreme military leader and the first among the nobility. The ritual scene on the rock tombs (Figure 94.4) makes visible the king’s personal relationship with Auramazda. The other images – the king fighting wild beasts and hybrid creatures (Figure 55.4) and the lion-bull-combat scenes (Figure 94.5) – continue to present difficulties, but are nowadays commonly understood as mythologizing celebrations (albeit entirely subjective ones) of the king’s struggle for the security of the empire, the maintenance of order and the victory of good over the bad.

Summary

These lapidary declarations constitute a definition of the Achaemenid concept of power. By re-using the topics formulated by Darius on later buildings his successors documented their adoption of this definition. The most complex topic of Achaemenid reliefs and paintings, the delegations and throne-bearers that depict the king’s relationship with his subjects, may serve as an example. Darius formulated this topic on the Apadana and the Tripylon at Persepolis and on his tomb at Naqsh-e Rostam, and his successors repeated it on the Hundred Column Hall, the staircase later relocated to Palace H, the wall-paintings found in the Palace at the Chaour and the western staircase of the Palace of Darius at Persepolis (cf. Jacobs 2002: p. 361). On each occasion these repetitions were quasi-commitments by the relevant king to the conception of monarchy created by Darius, to a personal obligation toward the god of the royal house and to familial continuity. The target-audience for this message, the group of people who would actually see the pictures, was small. Meanwhile the top-down communication that made exercise of power possible and kept the empire together occurred elsewhere and in other media (see Chapter 53 Roads and Communication, Chapter 54 The Interplay of Languages and Communication, Chapter 56 Seals and Sealing, Chapter 58 Empire, Borders and Ideology).

NOTES

- 1 Their original location can mostly be determined only approximately or not at all.
- 2 Fragments of reliefs from Hakavan in the district of Farmeshgan (Razmjou 2005: fig. 6–10) or from Bardak-i Sīāh in the province of Bushehr (Arfaee 2008: p. 74 n. 100) may have belonged to this kind of accommodation.
- 3 The sculptor Hinzani from whom the Egyptian satrap Aršāma ordered representations of a horseman, a chariot(?), and other subjects (Kuhrt 2007: p. 819 no. 64) may have been a seal-cutter (cf. the discussion in Tuplin 2013: pp. 100–107). If we have to think of large-scale representations, we should exclude that they were executed in the Achaemenid court style as the subject matter lacks parallel in monumental versions of that style.
- 4 Sistan has been included here because of the wall paintings from building no. 15 at Dahan-e Gholāmān (Sajjadi 2007: pp. 146–154 fig. 21–31) – hard to date though they are.
- 5 On the exceptional position of Egypt in this context and on its position as an ideological center of gravity see Jacobs (2012: pp. 108–111).
- 6 A section of DNb is attested in Aramaic on a papyrus from Elephantine (Sims-Williams 1981), while a clay tablet which exactly reproduces the text of DPa was found near Gherla in Romania (Harmatta 1954: pp. 7–10).
- 7 For a similar shift in the late Akkadian period see Sallaberger (2002).
- 8 Sommer (2005: p. 146): “Normally it is the elites of subject peripheries themselves who strive for assimilation, in order to exchange the loser’s camp for that of the victor. The initiative for assimilation thus comes from below, almost never from above, because, at least in cultural matters, empires practice an extraordinary degree of ‘structural tolerance’ (Jürgen Osterhammel).”

ACKNOWLEDGMENT

The author is very grateful to Christopher Tuplin for his assistance with the English version of this chapter.

CHAPTER 56

Seals and Sealing

Mark B. Garrison

Introduction

One of the most ubiquitous and long-lived artifacts from ancient western Asia was the engraved seal. The artifact took two primary forms, the cylinder seal and the stamp seal. On both types imagery is carved in the negative on the seal matrix; when rolled or impressed into a malleable medium, the carved relief then appears in the positive. Stone was the most common material for seals, but bone, metal, ivory, shell, and other materials could also be used. A typological variant of the stamp seal is the metal signet ring wherein the imagery is carved or cast into the ring face. Metal rings first appear relatively late, c. 600 BCE, but were then used with both the cylinder and the stamp seal throughout the Achaemenid period. Previous to the Achaemenid period, stone stamp seals could be set within bezels on metal rings, but the evidence for such is quite rare. Within the Achaemenid period, metal signet rings and stone stamp seals set within rings became very popular and, indeed, outlasted both the cylinder and the stamp seal, becoming the most common seal type in the Hellenistic and Roman periods.

Sealing is a confusing term. It can refer to the act of impressing a seal into a malleable medium, in ancient western Asia generally clay, or to the end product of that action, a raised relief on a clay document. In many publications the term sealing is used only for sealed documents that carry no text, but this convention is by no means universal.

Seals performed myriad functions in ancient western Asia. We can broadly divide these functions into two categories: the “administrative” and the “imaginary.” Both categories on various levels express aspects of identity and/or “personhood.”

In the “administrative” mode, seals operated exclusively in their impressed state. The most common surviving medium on which seals are impressed is the clay tablet that carries a text inscribed in cuneiform (used to write a variety of languages; Aramaic written in ink or inscribed on clay documents also occurs in the first millennium BCE). Clay tablets carrying cuneiform texts generally are rectilinear in shape, but many irregular shapes also occur. The second most common surviving format is a lump of clay that is used to secure doors and objects (e.g. boxes, sacks, jars, letters). This type of document, sometimes called a “sealing,” generally is uninscribed, but in some cases may carry short inscriptions in cuneiform. Often the lumps of clay are placed over knots of rope or string securing the object. This type of document assumes a variety of forms depending on the nature of the object to which it is attached (Herbordt (1992: pp. 33–70) concerning sealing practices in the Neo-Assyrian period). Lumps or rings of clay placed over strings securing letters are often called *bullae*; the term is, however, also applied to sealed clay documents securing other types of objects (Kaptan 2002: pp. 13–14). In all these examples of the “administrative” mode of seal use, the seal impression serves primarily to identify an individual or an institutional authority. In this sense the seal impression functions as something akin to the modern written signature in that it affirms, or verifies, the presence of individuals or offices as witness to transactions and/or indicates ownership, authenticity, administrative oversight, etc. The seal impression in its “administrative mode” may then be seen as some type of magical extension of the *persona* of the seal owner/user.¹

In the “imaginary” mode, seals could operate in their artifactual state (the actual seal matrix) and/or in their impressed state. The “imaginary” mode refers to the significance potentially ascribed to the artifact and/or the imagery carved upon it. As artifacts, seals could carry a variety of meanings; e.g. some types of material from which seals were carved were thought to have magical properties (Collon 1987: pp. 113–119). Certain types of precious materials, particularly gold and lapis lazuli, could also clearly signify aspects of social status. For this reason, seals were often worn conspicuously on the body (Collon 1987: pp. 108–112). The carved imagery and stylistic qualities of that carving, viewed primarily in the impressed state, could also convey a wide range of social significance. Understanding that significance is much more difficult of an endeavor given the almost complete silence in our sources to these types of issues.²

Glyptic imagery is a primary source for determining traditional art historical concerns such as period styles, themes, iconography, and composition. These

types of analyses seek to understand glyptic imagery within the broader visual landscape so as to construct a narrative sequence of changing patterns of visual representation through time and space. Thematic content is a particularly important area of research where one may also develop ideas concerning overarching cultural ideologies for a particular time and place and/or changes in cultural ideologies through time.

Another aspect of the “imaginary” mode of seals is the relationship of glyptic imagery to the seal user/owner. Given the variety of the surviving imagery and the oftentimes virtuosic carving techniques, one assumes that in some contexts visual imagery must have meant something to the seal owner/user beyond the purely functional (i.e. the need to impress an identifying mark on a document).

Seals and sealing thus are primary vehicles of communication, expressing a variety of messages in both “administrative” and “imaginary” modes. These two modes of communication are not, of course, exclusive to each other but, on the contrary, could function in tandem within multiple and complex signifying systems. The discussion that follows will concentrate on the “administrative” mode of communication; for the “imaginary” mode, see Chapter 95 The Minor Arts.

The Evidence

Seals and sealing were two critical mechanisms that allowed the Achaemenid imperial state to function and prosper. Seals and/or sealed documents survive from almost every region encompassed by the empire.

There are hundreds of seals that have been published under the general rubric of Achaemenid glyptic. Most of these seals are in fact court-centric iconography rendered in various local styles of carving. Perhaps the most oft-discussed and illustrated seals representing this type of phenomenon are the so-called Greco-Persian class of seals (see Chapter 95 The Minor Arts). The great majority of these Greco-Persian seals, as well as other examples of actual seals exhibiting court-centric iconography rendered in various local styles, are unprovenanced; thus, there is little that can be said concerning either their “administrative” or “imaginary” modes of communication.

Fortunately, from across the empire there survive large numbers of sealed documents coming from various types of contexts (Pedersén 1998: pp. 213–234; Garrison and Root 2001: pp. 32–39). Some of these contexts are clearly archival; indeed, the Achaemenid Persian period is exceptional in the number and quality of seals that survive as impressions within the context of archives. The full extent and significance of this material is only slowly coming into focus.

Given the wealth of surviving documentation, the discussion that follows is selective, seeking to highlight some of the assemblages of sealed documents and some aspects of the “administrative” mode of communication that they reveal.

Persepolis

By far and away the most important corpora of sealed administrative documents come from three archives at Persepolis: the Persepolis Fortification archive; the Persepolis Treasury archive; a hoard of administrative bullae and clay tags found in the “Mountain Fortification” on the Šāhi Kūh east of the Persepolis terrace (see also Chapter 6 The Inscriptions of the Achaemenids and Chapter 62 Persia).

The Fortification archive was excavated in two chambers of the northern fortification wall at Persepolis (hence its name). The archive concerns a state agency that managed, in a region centered on Persepolis, the collection, storage, taxation, and disbursement of locally-produced commodities (cereals, wine, beer, oil, honey, fruit, poultry, livestock) that were subsequently distributed as subsistence rations or “salary” to members of the royal family, the imperial elite, administrative officials, religious officials (and deities), travelers on the royal roads, agricultural workers, craftsmen, and livestock.³ The archive is dated by date formulae in the Elamite and Aramaic documents to the middle years of the reign of Darius I, 509–493 BCE (Henkelman 2008a: pp. 173–177).

The territory administered by the Fortification archive lay predominantly in what is today the province of Fārs. The exact extent of the administrative purview of the system is unclear; modern Behbahān may mark the westernmost extent of the system, Nīrīz the easternmost, in which case we are dealing only with the highlands of pre-Achaemenid Elam, not the lowland floodplains of the Susiana (Henkelman 2008a, pp. 110–117).⁴ Prominent features in the administrative landscape of the Fortification archive were segments of the famous royal road; some 20 post-stations appear to fall under the agency’s operational jurisdiction (Koch 1986, 1990; Vallat 1993; Graf 1994; Giovinnazzo 1994; Briant 2002: pp. 357–359, 365–368, 927; Arfa’i 1999; Potts 2008; Henkelman 2008a: pp. 113–115, 2008b; Garrison and Henkelman 2020a).

The Fortification archive is very large, perhaps as many as 20 000–25 000 surviving tablets and fragments (Jones and Stolper 2008: pp. 37–44; Henkelman 2008a: pp. 75–79; Garrison 2017: pp. 27–49; Azzoni et al. 2017).

There are three categories of clay documents in the archive: tablets carrying texts written in cuneiform script in the Elamite language (the most common type of document in the archive), generally sealed; tablets carrying texts

written in Aramaic script and language, almost always sealed; uninscribed, but sealed tablets.⁵

Among this documentation there are preserved some 4059 distinct seals, making the archive one of the largest corpora of visual imagery coming from a single discreet context (Garrison 2017: pp. 49–71, 77–103). These seals belong to or are used by a wide range of individuals, some entrenched as administrators within the system, others passing through on state business. The ability to link in many cases images to specific individuals and offices represents a rare opportunity to pursue myriad issues surrounding social aspects of visual imagery; at, no less, an imperial capital during the most critical formative period of the Achaemenid imperial phenomenon! The seals on the Fortification archive exist within a complex network of social and administrative relations between hundreds of individuals mentioned by name, office, and/or title. As a resource for the history of early Achaemenid art, the glyptic from the Fortification archive is unique. The importance of this corpus of visual imagery, both as regards “administrative” and “imaginary” modes of communication, cannot be overstressed.

Tablet shape is an important criterion of administrative legibility within the Fortification archive. This is especially the case with the Elamite documents, which have a highly developed typology (Henkelman 2008a: pp. 102–109; Garrison 2008). The Aramaic and the uninscribed documents share a distinctive small, triangular-shaped tablet format, suggesting that these two document types are closely related (Garrison 2008).

Sealing protocols are readily understandable and shared among all three document types (Garrison 2008, 2017: pp. 52–67; Henkelman 2008a: pp. 129–134). The vast bulk of the documents in the archive carry either one seal (single-seal protocol) or two seals (Figure 56.1). In several cases, there is a clear correspondence between tablet shape, sealing protocol, and text content. Of those documents that carry two seals, in many cases it is clear that a counter-seal protocol is followed: the seal on the left edge representing a commodity supply office, that on the reverse representing the receiver (or agent for the named receiver) of the commodity.

The Persepolis Treasury archive is a much smaller affair, consisting of 138 Elamite documents, one Akkadian text, and 199 uninscribed, but sealed, clay “labels” (Cameron 1948, 1958, 1965; Schmidt 1957: pp. 4–41, pls. 2–14; Jones and Yie 2011). The archive, found in a series of rooms in the northern part of the Treasury building at Persepolis, concerns payments of silver from the Treasury at Persepolis made in lieu of partial or full rations of sheep, wine, or grain to workers and craftsmen active at or near Persepolis. While the payment of silver is undocumented in the Fortification archive, there are numerous points of contact between the two archives, including administrative terminology and a handful of personnel and seals (Garrison 2017:

Figure 56.1 Persepolis Fortification archive, Left edge (PFS 66a*) and reverse (PFS 7*) of PF 702, example of tablet carrying the impressions of two seals. Source: Reproduced by permission of M.B. Garrison.

pp. 71–77). Henkelman (see Chapter 62 Persia) suggests that the Treasury archive “represents a branch of administration parallel, or perhaps subordinated, to that documented by” the Fortification archive. The named individuals that we meet in the Treasury archive are, however, many fewer in number

and of much more restricted administrative profiles than those in the Fortification archive. The published Elamite texts from the Treasury archive date to the period 492–457 BCE.

Seal usage in the Treasury archive is rather more limited than in the Fortification archive. The letter-orders from the Treasury archive are sealed by the issuers of the orders (as in the Fortification archive); there are 11 cylinder seals in total that occur on the letter-orders. Each memorandum from the Treasury archive also carries only one seal; only seven cylinder seals are involved. There is some debate as to whom the seals that occur on the memoranda belong.

The uninscribed “labels” from the Treasury are of varying sizes and shapes; no proper typology of the “labels” has ever been done (Schmidt 1957: p. 6; Garrison and Root 2001: p. 33). A few of the “labels” are similar to the uninscribed documents from the Fortification archive. Other “labels” were lumps of clay that had been affixed to cords, cords bundling objects (in some cases perhaps folded papyrus or parchment documents), or to the objects directly. One assumes that the “labels” were affixed to objects, presumably of some value, that were kept in the Treasury (cf. however, the comments of Razmjou 2008: pp. 55–57). Two seals, PTS 5* and PTS 8*, occur on both the “labels” and the Elamite documents; one thus assumes that the two document types were parts of the same administrative agency. There are many more seals – 61 – that occur on the “labels” than on the Elamite documents, and those seals include cylinders, stamps, and signet rings. As few as one and as many as seven different seals may occur on a “label” (Schmidt 1957: pp. 5–6). Lastly, all commentators since Schmidt (1957: pp. 14–15) have noted the high percentage of Greek and Greek-inspired imagery on the stamps and signet rings that occur on the “labels” from the Treasury archive. Schmidt (1957: pp. 15–16) suggested that these seals, or most of them, were owned by Greeks working for Persians. In fact, we have few clues as to when and where these “labels” were made. Schmidt inferred that the presence of PTS 5* and PTS 8* on the “labels” surely indicated that most if not all of the “labels” were generated at Persepolis. While this may be so with regard to those “labels” associated with those two seals, we cannot be as certain about the others. We have no direct information as to how and why objects came to be stored in the Treasury (Cahill 1985; Garrison and Ritner 2010: pp. 40–41).

In their “administrative” mode, the 18 cylinder seals from the Treasury archive (and the Elamite documents on which they occur) are directly linked to seals and Elamite documents that occur in the Fortification archive. The seals that occur on uninscribed “labels” and the “labels” themselves appear, however, to present a rather different dossier, one that merits a fuller analysis than heretofore undertaken.

The third Persepolitan archive comes from one of the towers in the fortification wall on the mountain Šāhi Kūh that overlooks the Takht (Tajvidi 1970,

1973, 1976: pp. 195–196; Garrison and Root 2001: p. 34; Henkelman et al. 2004: p. 41–42; Rahimifar 2005; Razmjou 2008: p. 57). The assemblage consists of some 60 uninscribed sealed clay documents and three actual cylinder seals. The discovery of the material in the fortification wall, as the Fortification archive on the Takht, suggests that the towers and rooms in the fortification wall were convenient areas of archival storage. None of the clay documents carry text; hence, we do not know the exact function of the material. Some of the documents resemble uninscribed documents from the Fortification archive (Rahimifar 2005: pl. 16); others are circular, elliptical, or squared and appear to be letter-bullae (Rahimifar 2005: pl. 17–23). There are at least eight distinct seals preserved on the clay documents, one of which also occurs on “labels” from the Treasury archive, PTS 28 (Tadjvidi 1976: p. 195, figs. 140–41; Rahimifar 2005 pl. 18; Tallis 2005: p. 231, no. 424; Schmidt 1957: pl. 9 no. 28). As a glyptic assemblage, the seals from the Šāhi Kūh exhibit many similarities to those from the Treasury archive; a direct connection between these two archives cannot be ruled out. Although relatively few in number, the seals from the mountain fortification archive include both Achaemenid court-centric iconography and Greek imagery. The glyptic material from the mountain fortification archive probably dates to approximately the same period as the Treasury archive.

Susa

Concerning Susa, the evidence for archives is fragmentary (as is often the case in the archaeology of the site). The number of actual seals of Achaemenid date found at the site is small; they are executed in various styles of carving, none of which could be characterized as Persepolitan Court Style.⁶ The seals preserved as impressions are likewise few in number but give glimpses of what may have been official state archives at the site (Henkelman 2008a: pp. 78, 110–115; 2012: p. 954). There is a fine heroic encounter executed in the Persepolitan Court Style preserved on a clay bulla (Amiet 1972: no. 2203). Most importantly, there is an Elamite document (Sb 13078), dated to 500/499 BCE, that clearly originates from an archive at Susa similar to the Fortification archive at Persepolis (Stolper in Harper et al. 1992: p. 273; Garrison 1996). The text belongs to a well-known type at Persepolis, and the tablet, remarkably, bears impressions of PFS 7*, one of the royal-name seals from the Fortification archive. Although the exact find-spot of the tablet is not documented, it must clearly have come from the excavations of the French mission at Susa. This single text documents what one would naturally expect, Fortification-type archives at important centers throughout the empire, but especially along the royal road. The occurrence of PFS 7* at Susa is also not

surprising, since the officials associated with this type of transaction appear to have traveled with the king as he moved between capital cities. Nonetheless, the preservation of the text and PFS 7* at Susa bears witness to, in a spectacular fashion, one aspect of the administrative infrastructure of the Achaemenid imperial phenomenon.

Daskyleion

Another important archive that apparently is directly connected to official Achaemenid administration comes from the satrapal capital Daskyleion in northwestern Anatolia (Kaptan 2002). The archive consists exclusively of uninscribed bullae and contains some 185 discrete seals (Figures 21.3–21.6). The exact find context of the archive is, unfortunately, unclear. The bullae for the most part were attached to documents written on papyrus and, in a few cases, parchment (Kaptan 2002: pp. 13–16). In this sense the Daskyleion archive then is distinct from those at Persepolis and Susa, where true (letter-) bullae are exceptionally rare. Because of their discovery at Daskyleion and the appearance of three royal-name seals, DS 2 (Xerxes), DS 3 (Xerxes) (Figure 21.6), and DS 4 (Artaxerxes), it is generally assumed that the bullae are remnants of some aspect of the official paperwork of the satrapal administration at the site. The date of the archive can be established only through a stylistic analysis of the seal images and the names in the three royal-name seals. The date is thus broad, from the reign of Xerxes (486–465 BCE) to the first quarter of the fourth century BCE (Kaptan 2002: p. 27).

The most common method of sealing at Daskyleion is the single-seal protocol, but two-, three-, and four-seal documents are attested. Many seals occur on multiple documents. These patterns of sealing are very similar to what one sees at Persepolis (Garrison 2008).

Memphis

A potentially important analogue for the glyptic material from Daskyleion is a small collection of seal impressions from Memphis in Egypt (Petrie et al. 1910: pp. 41–42, pl. XXIV; Colburn 2019: pp. 50, 53–71). Like Daskyleion, Memphis was a satrapal headquarters. Unfortunately, the site is inadequately excavated and the early excavations are poorly documented (Colburn 2019: pp. 30–45).

Excavations by Petrie in the early twentieth century in a structure identified as the palace yielded a small corpus of sealed uninscribed documents and wooden labels carrying Aramaic texts. The sealed documents, according to Petrie, came from “parcels,” not papyrus documents.⁷ The documents have

various forms, including small rounded or elliptical pieces of clay and irregularly shaped lumps of clay. Petrie thought that the wooden labels and sealed documents functioned in tandem, but it is unclear exactly what he had in mind. He dated the material to the fifth century BCE based upon its find context.

One group of sealed documents from Memphis consists of the impressions of 21 scaraboids or other types of stamp seals carrying Egyptian hieroglyphic script and/or figural imagery dating from various periods, the oldest (no. 1) being an inscription of Seti I (Petrie et al. 1910: nos. 1–21). These seals occur almost exclusively on small rounded or elliptical lumps of clay.

Another group of sealed documents from Memphis consists of the impressions of 18 cylinder or stamp seals carrying Achaemenid imagery or, in a few cases, hybrid Achaemenid and Egyptianizing imagery (Petrie et al. 1910: nos. 22–39). The quality of the photographs of the documents hinders any detailed stylistic observations, but there does not appear to be anything that one could characterize as Persepolitan Court Style. One of the most intriguing seals is Petrie's no. 22, which preserves the hindquarters of an animal/creature marchant and an impressive Old Persian inscription (SD²a) enclosed in a panel (Petrie et al. 1910: p. 42). Schmitt (1981: pp. 33–34) read the fragmentary inscription as a royal name. Petrie's no. 29 also appears to have a cuneiform inscription, although he did not note this fact in his description of the seal.⁸ The cylinders and stamps occur only on the irregularly shaped lumps of clay.

Correspondence of Aršāma

In some ways contextually related to the material from Memphis and Daskyleion are the famous parchment letters and sealed letter-bullae of the prince and satrap Aršāma.⁹ Aršāma was a satrap of Egypt sometime in the second half of the fifth century BCE (Briant 2002: pp. 364–365, 449–450, 456–458, 461–463, 557, 602–605, 973; Tuplin and Ma 2020). The 26 Aramaic letters and eight associated letter-bullae (Figure 56.2a,b) now in the Bodleian are said to have come from somewhere in Egypt. Although this assemblage of letters and letter-bullae may not be an archive *strictū sensō*, it is an important point of reference concerning archival practices for the Achaemenid period. The letters are principally Aršāma writing from afar to his estate personnel and administrative officials in Egypt authorizing or ordering various operations. There is also a famous travel ration (TADE A6.9) wherein Aršāma authorizes daily travel rations for his steward Nakhthor and 13 other individuals. Seven of the eight letter-bullae are carefully sealed with a large and handsome cylinder seal showing a combat scene; an Aramaic inscription on the seal reads “Seal of Aršām, son of the house” (Garrison and Henkelman 2020b). The eighth letter-bulla is sealed with a large stamp seal; the design is, however, very difficult to read (Garrison, Henkelman, and Kaptan 2020).

Figure 56.2 Oxford, Bodleian Library: Aršāma correspondence, obverse and reverse of letter-bulla Sigill. Aram 5.

Rather stunningly, the cylinder seal applied to the letter-bullae has now been identified on two Elamite documents from the Fortification archive (Garrison and Henkelman 2020b). Thus, when used on the letter-bullae associated with the Aramaic letters of the satrap Aršāma, the seal was an heirloom at least 60 years removed from its original Persepolitan context. Its original owner must surely have been the royal prince Iršāma (OP Aršāma), son of Darius and the queen Irtašduna, mentioned in several texts from the Fortification archive (Garrison 2014a: pp. 496–502; Garrison and Henkelman 2020b). The use of the seal by Aršāma the satrap in the second half of the fifth century BCE attests to the value placed upon certain high-prestige seals within the royal house, a practice richly documented as well in the Fortification archive with the magnificent heirloom seals PFS 51 and PFS 93*, the former belonging to another woman in the royal house, Irdabama (Garrison 2011). All three seals express yet another aspect of the “imaginary” mode of communication, in this case notions of connectedness to the royal house(s) through time.

Unprovenanced Clay “Tags”

Perhaps also potentially coming from an official state archival context is a much traveled collection of at least 42 sealed clay “tags” of uncertain provenance (Figure 56.3).¹⁰ The documents carry no text, only seal impressions. In total 11 quite spectacular seals are involved. The “tags” are triangular in

Figure 56.3 New Haven, Yale Babylonian Collection, YBC 17070: RB 2 impressed on uninscribed tablet.

outline, very similar in shape to many of the uninscribed documents from the Fortification archive (Henkelman et al. 2004: p. 7). Sealing praxis on these documents almost always requires impressions of three or four different seals, and often all five surfaces of the documents are sealed. As the original provenance of this material is unknown, it is perhaps fruitless to say much by way of the function of these documents.

All 11 of the seals are impressively carved cylinders, clearly high-prestige artifacts. Curiously, seven of the 11 seals show either hunt scenes or human combats, which otherwise are rare scene types in Achaemenid glyptic assemblages. The high quality of all the seals and the large percentage of hunts/warfare suggest that some sorting took place in order to appeal to potential buyers when the objects became available on the market. Although the seals are uniformly of high quality, the seal RB 2 stands out as especially impressive, an animal combat with a figure in a winged ring and an Aramaic inscription, rendered in the Achaemenid imperial Modeled Style (Figure 56.3). RB 5 is similarly grand, a hunter spearing a lion attacking a humped bull with an elaborate winged ring in the upper field. The Persian court robe and winged symbols are very common among the 11 seals; two of the seals are inscribed (RB 1 and RB 2). The universally fine, and in some cases virtuosic, carving of these seals as a group is matched perhaps only by the seals applied to the letter-orders from the Treasury archive.

Wadi ed-Daliyeh, Samaria

A substantial corpus of sealed letter-bullae and their associated papyri comes from Wadi ed-Daliyeh (Cave 1) in Samaria (Leith 1997).¹¹ The papyri were legal and administrative documents, written in Aramaic, originating from the province or city of Samaria. Date formulae in some of the texts place the surviving corpus from 375 BCE to not long after 334 BCE (Leith 1997: pp. 5–6). The texts concern local matters exclusively. A few of the letter-bullae were still attached to papyrus documents, and many of the loose letter-bullae still had string (Leith 1997: pl. 22). As is typical for letter-bullae, most of them were round or oval in shape, the backs preserving impressions of the strings and folded papyrus documents.

Leith (1997) published 61 distinct (and legible) seals preserved on the letter-bullae (see Garrison and Root 2001: p. 38). Unfortunately, it was not possible to link any of the seals with any of the individuals named in the texts; the general consensus is that the seals belonged to members of the local elite (Leith 1997: pp. 6, 22, and 32; Garrison and Root 2001: pp. 38–39). The seals used to make the impressions are almost exclusively stamps and signet rings (Leith 1997: p. 23). The imagery on the seals is quite varied, including

paleo-Hebrew inscriptions, various Greek carving styles, hybrid Greek-Phoenician styles, and Achaemenid court-centric iconography rendered in various local carving styles. Achaemenid court-centric iconography is, however, relatively rare in this corpus, and there is nothing that one could qualify as Persepolitan Court Style.

Babylonia

There are many archival documents spanning the Late Babylonian and Achaemenid periods from Babylonia (Pedersen 1998: pp. 181–213; Garrison and Root 2001: pp. 37–38; Balzer 2007). These archives are almost exclusively from temple and private business contexts. Two of the most important archives that contain substantial numbers of sealed documents (and are relatively well published) are those associated with the Ebabbar of Šamaš at Sippar and the Eanna of Ištar at Uruk.

Of the thousands of tablets from the Sippar archive, only a small percentage has been published.¹² The archive dates from the reign of the Late Babylonian king Nabopolassar down into the second year of Xerxes (c. 625–486 BCE). Balzer reports that only approximately 440+ of the over 30 000 tablets dating to the Achaemenid period from the Ebabarra now housed at the British Museum are sealed; this yields a fairly low percentage of sealed tablets (approximately 15%). A selection of letter-orders carrying some 67 distinct seals is the primary glyptic assemblage that is readily accessible (MacGinnis 1995: pp. 164–181). As the letter-orders often have multiple authors, as many as three different seals may appear on a document (MacGinnis 1995: p. 166; in one instance, there are four seals applied to a document). Cylinder seals by far are more common than stamp seals. MacGinnis (1995: pp. 165–171) has been able to detect some correlations between officials and seal format and/or imagery. The glyptic imagery of this group of 67 seals, widely dispersed in date, is almost completely Babylonian.

The archive from the Eanna of Ištar at Uruk consists of some 8000 tablets (Ehrenberg 1999: p. 10). The archive dates from Nabopolassar through the 22nd year of Darius I (c. 612–499 BCE) (Ehrenberg 1999: p. 13). As with most of these Babylonian archives, many of the documents were excavated illicitly and reside today in various collections (Ehrenberg 1999: pp. 2 and 11; Balzer 2007: Chapter II, p. 56). Similar to the Ebabbar, only a small percentage of the documents from the Eanna are sealed, approximately 2% (Ehrenberg 1999: p. 33). Ehrenberg (1999) has published in an exemplary manner some 219 seal impressions from the Eanna.¹³ The number of distinct seals among these 219 impressions appears to be approximately 147. The sealed documents consist principally of receipts for commodities, letter-orders, and lists of itemized goods, personnel, or payments. Documents carry normally only one

or two seals. Cylinder and stamp seals occur in approximately equal numbers (Ehrenberg 1999: p. 34). In general, determining who used the seal is not possible within the archive (Ehrenberg 1999: pp. 34–36). Because of the early date of the archive and its provenance, the glyptic imagery is highly restricted in thematic content (worship scenes and heroic encounters) and has no Achaemenid court-centric iconography.

One of the most well-known archives from the Achaemenid period is the business records associated with the Murašû family at Nippur, dated to the period 454–404 BCE (Stolper 1985; Donbaz and Stolper 1997; Bregstein 1993, 1996; Balzer 2007: Chapter II, pp. 57–58, Chapter XVIII, pp. 6–8). Unlike many of the Babylonian archives, the tablets of the Murašû firm have a documented context, found in a single room in a house on what was called Camp Hill (Bregstein 1993: pp. 20–23). The primary types of texts are receipts for payments of rents and taxes, certificates of debt against real security (“mortgages”), and leases (Bregstein 1993: pp. 42–45). The texts come predominantly from Nippur, but there are also texts from the surrounding region, Babylon, and Susa. Balzer (2007) counts some 868 published tablets and fragments from the archive. Over 600 of these tablets are sealed, preserving over 700 different seals.¹⁴ By Babylonian standards, this is a very high percentage of sealed documents. Sealing praxis varied by transaction type, but most transactions required the impressions of seals of multiple witnesses (Bregstein 1993: pp. 304–363).

There are more seals preserved in the Murašû archive than any other Babylonian archive of Achaemenid date, and the glyptic material is of an extremely high quality. The fact that a comprehensive accounting and documentation of the seal impressions preserved in this archive has yet to be published remains something of a mystery. Bregstein’s (1993) unpublished dissertation remains the only monographic treatment of the glyptic from this archive. She includes some 657 distinct seals in her catalog, with an approximately equal distribution of cylinders, stamps, and signet rings (Bregstein 1993: pp. 53, 294). Since many of the seal impressions were accompanied by captions, a very high percentage of the seals can be associated with specific individuals named in the texts (Bregstein 1993: pp. 109–377, 1996).

As a comprehensive publication of the seals is yet to be made, it is perhaps premature to make far-reaching conclusions concerning trends in glyptic theme, composition, iconography, and style. Not surprisingly, the glyptic imagery from the archive is strongly Babylonianizing.

Ur

Lastly, from a coffin at Ur in Babylonia comes a most remarkable assemblage of impressed artifacts in lumps of clay.¹⁵ The impressions were made by seals, coins, and metalwear. The material appears to date from a wide-ranging period,

c. eighth century BCE down to the late fourth century BCE or later (Collon 1996: pp. 66 and 78; Mitchell and Searight 2008: p. 169). Most of the seal impressions are small stamp seals or signet rings; in some cases an image exists in multiple impressions. All of the impressions had been fired in antiquity (Collon 1996: p. 66). Interestingly, six of the seal “impressions” are in sunk relief (Mitchell and Searight 2008: p. 8, “in intaglio”), indicating that they were made by pressing the clay onto an ancient seal impression. The glyptic imagery is diverse. Greek themes and cutting styles dominate, but there is also a variety of carving styles exhibiting Achaemenid court-centric iconography and a few Assyro-Babylonian heirlooms. There is one very excellent cylinder seal that shows a hunt scene with two crowned figures in the Persian Court robe, with a winged disk in the upper field, clearly Persepolitan Court Style (Collon 1996: p. 68, pl. 12a; Collon in Merrillees 2005: p. 81, pl. 34a).

Most commentators interpret the material as a collection of models for use by an artist, perhaps even a seal cutter. The assemblage is a striking testament to yet another aspect of the “imaginary” mode of glyptic imagery, the perpetuation of specific imagery via systematic retrieval and collecting.

NOTES

- 1 Cassin (1987) is a provocative discussion of the relationship of the seal to the individual; Winter (2001: pp. 2–3) reviews related issues.
- 2 Marcus (1996) presents an excellent case study suggesting that glyptic style marked group affiliation at Hasanlu. See also Garrison (2014a,b, and 2017) for Persepolitan glyptic.
- 3 For introductions and/or surveys of the Fortification archive, see: Hallock 1969: pp. 1–69, 1977, 1978, and 1985; Hinz 1970 and 1971; Lewis 1977: pp. 4–14, 1984: pp. 592–602, 1990, and 1994; Dandamaev and Lukonin 1989: pp. 90–237; Koch 1990 and 1992: pp. 25–67; Wiesehöfer 2001: pp. 66–79, 268–270; Garrison and Root 2001: pp. 1–60; Briant 2002: pp. 422–448, 938–943; Kuhrt 2007: pp. 763–814; Arfae 2008; Henkelman 2008a: pp. 65–179; Garrison 2017: pp. 27–75; Azzoni et al. 2017.
- 4 Henkelman (see Chapter 62 Persia) states that in size the territory administered by the Persepolis Fortification archive was approximately the same as modern Switzerland.
- 5 See Stolper and Tavernier (2007: pp. 3–4 and 23–25), with previous bibliography, on *unica* within the archive.
- 6 Amiet 1972: nos. 2204–2225. Several of the seals classified as Neo-Elamite in Amiet 1972 could easily be Achaemenid in date based upon the evidence of the Fortification archive (e.g. Amiet 1972: nos. 2128–2129, 2171–2179, 2181–2183, 2186–2187). Only a handful of seals has been discovered in excavations subsequent to 1967.

- 7 The backs of the documents were not published, and, unfortunately, the material was lost in World War II. Thus, we are unable to confirm Petrie's observations or to glean more about the types of objects to which these documents were attached.
- 8 Petrie, Mackay, and Wainwright (1910: nos. 41–50) also published another 10 sealed documents or seals coming from various parts of the palace and his Memphis-Meidum excavations. Most of these seals are Egyptian scaraboids. No. 46, “found about the palace,” appears to be a rather handsome cylinder seal showing an elaborate composite human/animal archer scene (see Garrison 2010: pp. 341–350 for the type).
- 9 The dossier concerning prince Aršāma is an extensive one. The most well-known parts of it are 14 mostly well preserved and 12 fragmentary Aramaic letters written on parchment and eight sealed letter-bullae presumably originally associated with the letters, now housed in the Bodleian Library at Oxford (Porten and Yardeni 1986: nos. A6.3–6.16, D6.3–6.14; Garrison, Henkelman, and Kaptan 2020). Tuplin and Ma (2020) provide a new edition of the letters of Aršāma now at Oxford as well as a detailed analysis of the letters, bullae, and the complete dossier on the satrap Aršāma.
- 10 Henkelman et al. (2004) carefully track the record of publication and current disposition of these artifacts, which can be traced back to Scheil (1901): 21 in the Böhl Collection of NINO, one in the former Böhl collection at Groningen, 14 in the Musée du Louvre, three in the Yale Babylonian Collection, two in the Bibliothèque Nationale, one in the former Crozer collection. As the authors note, Scheil (1901) described the imagery of one seal that is not found on any of the known 42 documents; hence there is at least one more document that belongs with this group. Scheil (1901: p. 567) said that the tags came from Telloh, but Goetze (1944: p. 97) was skeptical, as also Henkelman et al. (2004: p. 16); see also the comments of Garrison and Root (2001: p. 37).
- 11 Nomadic tribesmen made the initial discoveries in the cave; excavation followed thereafter, but the bulk of the papyri and sealed letter-bullae, known today as the Samaria Papyri, were acquired through purchase from the tribesmen (as also two gold rings that appear to have come from the cave).
- 12 See Balzer (2007: Chapter III, pp. 63–65, Chapter XVIII, pp. 15–16) for a discussion of the sealed documents from the Ebabbara and a list of all published tablets of Achaemenid date from Sippar.
- 13 See Balzer (2007: Chapter XVIII, p. 5) for a list of all published sealed documents of Achaemenid date from Uruk. In many instances the same seal occurs in multiple impressions.
- 14 Balzer (2007: Chapter II, p. 58). On the number of seals, Balzer (2007: Chapter II, p. 58 note 22) reports: “Hatte Legrain in PBS XIV etwa 200 Murašû-Siegel bekannt gemacht, konnte der Autor beim Studium der

- Tafeloriginale in Philadelphia über 700 individuelle Siegel identifizieren.”
- 15 See Garrison and Root (2001: p. 39) with previous bibliography to which one should add Mitchell and Searight (2008: pp. 168–181, nos. 525–88), who publish the seal impressions and include an important discussion of the probable archeological context of the coffin.
